Comment Disapproval of the manner in which this bill is drawn was expressed, and it was suggested that the matter could be better cared for if the bill were drawn along the lines of the Workmen's Comp Act.

Assembly Pr 826 (Sen Int 1—Dunnigan)—social security—No action

Assembly Int 59, Pr 59—Hammer—old age assistance—Disapproved

Comment It was thought that this might tend to discourage treatment of old-age pensioners in their homes

Assembly Int 179, Pr 179—Zimmerman—social security—No action

Assembly Int 260, Pr 262—Sutor—hospitalization of motor vehicle victims—Disapproved

Comment The definition of an indigent is too inclusive, no provision for compensating doctor and nurse, would admit of grievous abuse and savors of state medicine

Assembly Int 299, Pr 302—Bush—pathogenic organisms and viruses—Approved

Assembly Int 327, Pr 331—Jarema—application for marriage license—Approved in principle

Comment Bill needs amending. A surety of freedom from disease can not be established on one examination nor on an examination taken as long as 30 days in advance. Including other communicable diseases would prevent persons with tuberculosis from marrying

Assembly Int. 335, Pr 339—McCaffrey—physical examination of employees—Disapproved

Comment It was contended that the presence of the attending physician is highly desirable and the presence of the physician for the carrier does not work an injustice to the person examined, and both may be very helpful to the examining physician from the Department of Labor

Assembly Int. 346, Pr 350—Andrews—Division of Syphilis Control in Dept. of Health—Approved

Assembly Int. 355, Pr 359—Breitbart—application for marriage license—Approved

Comment It was conceded that this is a better bill than the Jarema bill, but that it also has obvious weaknesses. Again, on the basis of only one examination no certificate could be given that syphilis was not present.

Assembly Int 471, Pr 476—Moran—enjoining illegal practice of profession—Approved

Assembly Int 476, Pr 721—Turshen—examination of motor vehicle drivers—No action

Comment It was the consensus of opinion that something should be done with regard to the physical examination of those who would drive automobiles, and the hope was expressed that the Department of Motor Vehicles might soon propose some workable plan

Assembly Int 485, Pr 491—Brownell—examination of food handlers—Approved in principle

Comment It was stated that New York City had abandoned its ordinance requiring the examination of food handlers because of the difficulties involved in its administration. Doubt was expressed as to whether this bill could be administered

Assembly Int 571, Pr 580—Brownell—study of health, etc., of urban colored population—No action

Assembly Int 574, Pr 583—Bush—filing of birth records—Disapproved

Comment It was thought that 48 hours is insufficient time for reporting births, because family is frequently not able to decide upon a name in so short a time

Assembly Int. 575, Pr 584—Bush—reporting communicable diseases—Approved

Assembly Int. 702, Pr 715—Moran—dental inspectors for schools—Disapproved

Assembly Int 804, Pr 831—Austin—licensure of laboratory technicians—Disapproved

Senate Int. 598, Pr 634—Feld—advertising by physicians—Approved

Assembly Int. 892, Pr 926—Neustein—health insurance—Disapproved

Assembly Int 900, Pr 934—Taylor—practice of optician—Approved

Senate Int 358, Pr 368—Esquirol—nurse practice—Approved

Comment Certain amendments were considered essential (1) Recasting the definition of nurse so as not to prevent a physician from using his own office assistant (2) nomenclature of second group, (3) more explicit statement of educational qualifications of second group

Assembly Int 370, Pr 374—McCaffrey—nurse practice—Disapproved

Senate Int 600, Pr 636—Feld—nurse practice—Disapproved

Apropos of the communication sent by the Committee to our Congressmen relative to the creation of a Department of Health in the reorganization of the Federal Government the following resolution was read as having been adopted by the Trends Committee and the Executive Committee

That the Medical Society of the State of New York urge that the reorganization of the Federal Government combine in one department

all medical and health activities, making this a separate and distinct department, and urge especially the nomination as chief executive officer of such a department a qualified physician with a record of achievement in administration

Dr Nelms announced that a lien bill has been drafted as an amendment to last year's hospital lien bill and will be introduced in the very near future

THE SCIENTIFIC PROGRAM COMES TO LIFE

The Italian Medical Center in New York City introduced a new method of presenting and discussing medical and medico-social subjects, devised by Dr Soresi, on January 13, at their monthly meeting in the auditorium at 135 East 55 St. Instead of the customary, too often monotonous and sleep-inducing reading of typewritten manuscripts, short sketches were enacted. The scene, according to subject, was set as occurring in the doctor's consulting room, operating room, emergency room, x-ray room, etc. Thus, for instance, in presenting the subject "Sane, Safe and Practical Criteria in Dealing with Acute Abdominal Cases," by Dr Soresi, the scene represented the emergency room of the hospital. The patient was brought in accompanied by the family physician and some members of the family. Dr Soresi spoke with the members of the family, with the doctor and the patient. He examined the patient, discussed the case and stated the reasons for his actions and considerations as in actual practice. The men invited to discuss the subject were called in, as if they were consultants whose opinion had been requested. Dr Soresi closed by stating what his conduct would be.

In the presentation of the other two subjects, namely "Blood Grouping and Research of Paternity," by Dr DeBiasi and "Contraceptive Methods," by Dr DePietro, the scene represented the consulting room of the doctor's office. A man who is sued as being the father of a child comes to Dr DeBiasi to ask his advice about attempts

to prove that he is not the father of the child by blood tests. Dr DeBiasi discussed the subject as he would in his office in actual practice, answering the different questions of the man who consults him.

A young couple came to consult Dr DePietro because, although married, they cannot afford to have children at the present time. Dr DePietro explained to them the different problems relating to contraceptive methods and answered their questions. As for the first paper, the men taking part in the discussion were called in as consultants.

It is evident, says Dr S. Reale, the Secretary, in a letter to the *New York Medical Week*, that by dramatizing the generally arid medical subjects the audience is kept interested, the dialog prevents monotony and lends life to the presentation and discussion. By proper rehearsing, any medical or medicosocial subject can be presented and discussed much more intelligently and interestingly than by the customary method of having the speaker read a paper and invite discussion from previously selected men or from any member of the audience who often wanders from the subject and makes the whole evening far more interesting.

The scientific program was preceded by a short moving picture satire, "The Emergency Operation," and was followed by an Italian collation.

Members of the medical profession were cordially invited to be present and to give suggestions for the betterment of this novel method of presentation.

The compromise between the Food and Drug Administration and the Federal Trade Commission whereby the former agency is given control over advertising in the provisions set up by the new food and drug bill

opens the way to enactment of the measure, says the *U S Weekly News*, of Washington, D C. Dispute over which agency should control advertising caused the defeat of the bill introduced at the last session.

COMMITTEE ON PUBLIC RELATIONS

The following letter was sent to Chairmen of County Society Committees on Public Relations and others interested in the activities of the State Committee on Public Relations

Dear Doctor

It is the wish of the Medical Society of the State of New York and the Public Relations Committee that agreeable contacts be made with members of the legal profession in each county. It has been suggested that at least one meeting a year be held to which members of the legal profession be invited to attend and to discuss problems of mutual interest. In this way, a better understanding of the problems of the medical profession will undoubtedly result. Some of the county medical societies have done this for several years. We hope if your society has not, that it will arrange for a meeting in the near future.

It was the opinion of the last house of delegates that the formation of Community Health Relations Councils in each county would result in better coordination of health activities. We feel that this matter is one for each county society to originate itself. Problems will of necessity be different in every county. Some such health agencies have already been started in many counties. Members of the medical profession should endeavor to cooperate if not lead in all matters pertaining to health and preventative medicine.

After conference with department heads in the State of New York the Public Relations Committee offered through its executive committee the suggestion that for the better and continued care of patients in Mental Hygiene Hospitals, State Tuberculosis Hospitals, and the State Institute for the study of Malignant Diseases at Buffalo, New York, notice of discharge or parole be given to the family physician or the committing examiners. We feel this will have a very desirable effect and insure correct and continued care of the patient.

The committee has undertaken in cooperation with the Grievance Committee and Legal Department of the State Medical Society, a study of the more frequent causes of malpractice actions. When completed, the results will be compiled and communicated to each county medical society for their information and guidance.

A new Program and Bulletin on the administration of school health service has been reviewed by the Public Relations Committee. It is our opinion, that in the interest

of the child, more careful and complete examinations be made and that it is desirable as many as possible be made by the family physician.

It is not always possible or practicable for the school children to be examined by the family physician and in many such instances regularly employed physicians are doing the work thoroughly and conscientiously, with very satisfactory cooperation from school officials. It is not intended that this communication shall interfere in those places, but rather that it shall help support school officials and physicians so employed where conditions are less favorable, to achieve more efficient and satisfactory examinations.

It is to be hoped that proper and adequate facilities will be furnished and that there will exist between the medical examiner and the school authorities a mutual feeling of harmony and cooperation in the handling of this important piece of work, which may mean so much to the future health and happiness of the child.

Many physical defects found will be corrected by cooperation of the Doctor and Parents. A normal healthy child will attend school regularly, make more progress and have a much better mental outlook. The active cooperation of the parents, medical school nurse, medical school examiner and the family physician, is necessary to obtain the desired results.

The committee is continuing its efforts for the better care of the Deaf and Hard of Hearing children of the State. Last year legislative bills were enacted, which require yearly examinations by scientific methods, to determine hearing acuity, and the reporting of all deaf or hard of hearing children. The early recognition of hearing defects and the correction and treatment of the causative factors, will prevent serious hearing losses later. Legislation will be sought this year to obtain lip reading instruction and other methods, for all children with hearing losses who need this special instruction added to the regular work. Some children with too great a hearing loss to profit by grade instruction, should be in special classes with lip reading and hearing equipment.

The members of the Public Relations Committee of the Medical Society of the

State of New York want to assist you in all problems that come within our scope of activities. We are taking this opportunity to ask you a few questions, referable to your county medical society

1 What has your committee or county medical society done to help establish working relationship with governmental and lay health organizations?

2 Are you undertaking or cooperating at the present time in any important health activity?

3 What educational health activities are occurring in your county?

4 Are the members of the medical profession in your county assuming leadership in all health progress?

We are sure you are living up to the high ideals of the medical profession. The Public Relations Committee will be glad to hear from you in regard to the above. We solicit your advice, suggestions and active cooperation.

Many other problems have come before the members of the Public Relations Committee. Many principles have been established, others are in course of solution. All have important bearing on the future of the medical profession, and the citizens of this state. Leadership, good medical practice and cooperation should be our watchwords.

AUGUSTUS J. HAMBROOK, M D, *Chairman*

THE TRAIL OF THE "TRAILER"

Our motor trails are crowding more and more with "trailers," and it is growing more important that the trail of the trailer shall be a clean one.

As trailers multiply, new sanitary problems arise to disturb our health officials. Foremost are the provision of safe milk and water and the sanitary disposal of human waste. With reasonable care in choice, safe water is readily available along the highway in many states, similarly the obtaining of safe milk, while slightly more difficult, offers no great hazard to the careful purchaser.

The chief source of concern, as the *AMA Journal* notes, is the unsafe or insanitary disposal of human excreta by trailer travelers. Many trailers now provide a small toilet compartment in which excreta may be deposited in cans containing chemical solutions reputed to render the waste innocuous. What to do with the material in the cans is the problem of present concern. No extensive or satisfactory sanitary provisions have been made for the disposal of these wastes and the cleansing of the cans.

Serious consideration, it is believed, must now be given to providing roadside facilities for the sanitary disposal of human waste from auto trailers. State or county departments of health may construct disposal systems near roads frequented by auto trailers, the location of which can be made known by appropriate road signs. Recognition has been recently accorded the problem by the city and county of San Francisco, which has prepared a sanitary code sug-

gested for their citizens when using such conveyances for traveling. According to this code, all trailers should be equipped with an air-tight container of not less than five gallons capacity for the storage of garbage. This container may be emptied only in places approved and so designated by the health authorities of a particular locality.

If the trailer is equipped with running water and a flush toilet, an adequate sewage tank should be provided underneath the trailer for the collection and storage of such waste. The tank should be emptied only into sewer connections or by other approved methods of disposal provided by the community. When equipped with water tanks for household use, the tanks must be inspected by an approved health authority at intervals of six months with reference to the potability of the water. Furthermore, water for filling the tanks should be drawn only from certified sources. The code also imposes regulations concerned with parking, food supply, ventilation, cleanliness, and screening.

The use of pasteurized milk exclusively is recommended, and trailer travelers are warned concerning the need for securing medical attention if illness arises. The desirability of vaccination of children against smallpox and their inoculation against diphtheria is stressed. Even if no further increase in the number of individuals traveling and living in automobile trailers should occur, it is definitely incumbent on local health authorities to enact and enforce suitable legislation covering the health problems raised by this migratory population.

REWARD

On January 12, 1937, Homer S Cummings, Attorney General of the United States, under authority vested in him by an Act of Congress offered a reward of

\$10,000.00

for information furnished to a representative of the Federal Bureau of Investigation, United States Department of Justice leading to the identification and apprehension of the person or persons responsible for the kidnaping on December 27, 1936 and subsequent murder of CHARLES FLETCHER MATTSON, ten-year-old son of Dr and Mrs W W Mattson of Tacoma, Washington

The person who kidnaped Charles Fletcher Mattson from the residence of his parents on the night of December 27, 1936 is described as follows

Age	About 30 years
Height	5 feet 7 or 8 inches
Weight	145 to 165 pounds
Complexion	Swarthy
Peculiarities	Did not stand erect, dimple in chin, high cheek bones, nose appeared to be broken a little below center, had hairy hands
Speech	Slightly foreign accent, spoke brokenly, appeared to be of Southern European extraction

\$10,000

This photographic reproduction is of an artist's drawing of the man who kidnaped Charles Fletcher Mattson, ten year old son of Dr and Mrs W W Mattson of Tocoma Washington from the residence of his parents, at approximately 9 P M on the night of December 27, 1936. The drawing has been made from oral descriptions of the kidnaper by children who were at the home of Dr Mattson at the time of the abduction.

All claims to any of the aforesaid reward and all questions and disputes that may arise as among claimants to the reward shall be passed upon by the Attorney General and his decision shall be final and conclusive. The right is reserved to allocate portions of the reward as among several claimants. No part of this reward shall be paid to any official or employee of the Department of Justice.

If you are in possession of any information concerning the identity or whereabouts of the perpetrators of this offense, it is requested that you communicate immediately by telephone or telegraph, collect, with the nearest division of the Federal Bureau of Investigation, United States Department of Justice, the addresses of which in New York State are set forth below or directly with the National Headquarters of the Federal Bureau of Investigation at Washington, D C, telephone

NATIONAL 7117.

Communicate with local Bureau office, 607 U S Court House, Foley Square Tel Rector 2 3520 New York City, or 612 Marine Trust Tel Cleveland 2030, Buffalo

UNITED STATES DEPARTMENT OF JUSTICE,
WASHINGTON, D C

WORKMEN'S COMPENSATION

State Industrial Commissioner Elmer F Andrews delivered this informing and important address before the Medical Society of the County of Queens on January 26 The Commissioner said in part

To insure adequate care and treatment of the injured worker is the purpose of the medical practice amendments to the Workman's Compensation Law under which we have operated for more than a year and half Underlying this purpose is a principle as old as the theory of workmen's compensation

When interpretation of the common law denied to a servant the remedy for personal injury which a stranger might obtain against a master, and later when employer liability laws permitted redress for an employee only under severely restricted conditions, it became necessary to protect a worker's physical and economic welfare by providing compensation for physical injury arising out of and in the course of employment, the cost of which would be charged against industry without inquiry into whose fault caused the injury Laws and jurists laboring under the old tradition have habitually emphasized the sanctity of property rights and been inclined to sacrifice human rights The Workmen's Compensation Laws were the most important of the earlier statutes enacted in the newer tradition of giving prime consideration to preserving human rights by governmental action

Doubtless the need for legal safeguards for workers has been impressed upon the medical profession much more widely during the past year because of the provisions of the medical amendments which give to the County Medical Societies such an important part in the administration of the Law Much of our effort under the amended Law has been to set up the administrative machinery Those operations are not yet completed nor perfect They involve innumerable details and questions which at times may seem to demand our entire attention But we must not let this divert us from the main objective of the medical amendments, namely the welfare of the injured worker Our detailed arrangements and the answers to our questions must be pointed directly at this objective, and where any doubt arises, the benefit should be accorded the interests of the injured worker even at the expenses of others involved

Of the 30,000 physicians licensed to practice in New York State, 13,803 have applied for and received authorization to practice in workmen's compensation cases as required

by the amendments Three-quarters of these authorized physicians are in the Metropolitan District comprising the counties of New York, Bronx, Kings, Queens, Richmond, Nassau, Suffolk, Rockland, and Westchester The remaining authorized physicians are about evenly divided among the four upstate districts centering in Albany, Syracuse, Rochester, and Buffalo, ranging from 953 in the Rochester District to 1,431 in the Albany District.

Fifty-nine medical bureaus have been licensed under the amended Law, seventy-seven more have been approved, one withdrew its application for a license and twenty-nine bureaus were refused authorization while the applications of 243 more are pending

Medical bills to be set for Arbitration Committee hearing number 2,274, and 1,691 medical bills have been protested and adjusted without arbitration Another 1,704 protested medical bills are being held pending receipt of further information One hundred fifty-three protested hospital bills were adjusted without arbitration and fifty-six are pending Twenty-eight protested medical bills and one hospital bill in self-insurers' cases have been adjusted without arbitration, and forty-two medical and one hospital bills in no-insurance cases, while pending there are twenty-two doctors' bills and four hospital bills under self-insurance, and 168 doctors' and eleven hospital bills under no-insurance This is a total of 6,155 protested bills which have come to the attention of the Compensation Medical Registrar

Arbitration of protested bills is provided for under the Law as follows

If the parties fail to agree as to the value of medical aid rendered under this Chapter such value shall be decided by an arbitration committee consisting of two physicians designated by the President of the Medical Society of the County in which the claimant resides, and two physicians, also members of the Medical Society of the State of New York, appointed by the employer or carrier The majority decision of the Arbitration Committee shall be conclusive upon the parties as to the value of services rendered In the event of equal division, the Committee shall select a fifth physician, also a member of the Medical Society of the State of New York, whose decision shall be conclusive.

In a case involving osteopaths, such physicians shall constitute the Arbitration Committee.

No Arbitration Committee has yet heard a disputed bill. Besides the 1916 of the bills coming to the attention of the Labor Department which were adjusted without arbitration, there is reason to believe that many have been adjusted directly between the concerned parties without coming to the attention of the Registrar's office. Legal authorities advise us that such direct adjustments are permissible despite the requirements of the Law that charges be made in accordance with a minimum medical fee schedule. However, there are 4,239 protested bills still awaiting the action of an Arbitration Committee. This is a matter wholly within the province of the physicians themselves.

On the other hand some physicians have complained because of their inability to collect their bills when the injury treated proved to be non-compensable. Naturally then, they could not collect from a carrier or employer, although in many cases insurance carriers do pay for these bills. Otherwise, their charge automatically transferred against the injured worker whom they treated and from him it is collectible. There has also been some difficulty in collecting medical and hospital bills properly chargeable and collectible from non-insured employers. The medical amendments failed to provide any specific enforcement or penalizing clauses for such cases.

The State Supreme Court in an opinion by Justice Shientag has ruled that the medical amendments to the Workmen's Compensation Law preclude a physician not authorized for compensation practice to collect his fee under the common law. In his opinion, Justice Shientag upheld the constitutionality of the medical provisions of the Law. The plaintiff physician filed an appeal from Justice Shientag's decision on which the constitutionality of the medical amendments will be argued before the State Court of Appeals next month.

Administrative rules and regulations clarifying and applying the medical practice provisions and a minimum medical fee schedule for the Metropolitan District have been adopted and promulgated. Forms for notices, applications, certificates, etc., have been designed, printed and distributed and in use for several months. The Medical Sub-Committee of the Industrial Council has conducted innumerable meetings and not a few hearings on appeals by physicians from County Medical Society refusals to recommend authorization for compensation practice. Procedure under which such ap-

peals can be heard and determined and procedure for arbitration of disputed medical and hospital bills were determined upon.

In authorization of physicians the question was brought up by some applicants as to the validity of the waiver of rights of redress in the event of adverse recommendation by the County Medical Society which passed upon the application. The opinion of the Attorney General supported the contention of the applicants and the waiver has been eliminated from the application blanks.

Administration of the medical provisions of the Law presented fourteen questions upon which the opinion of the Attorney General was secured. Most important of these interpretations of the Law were those:

Defining the nature of evidence necessary to sustain a charge of solicitation.

Defining the rights, duties and limitations of the Medical Sub-Committee of the Industrial Council.

Defining the extent of authority to be exercised by Medical Compensation Boards of County Medical Societies and the latitude to be allowed in considering applications filed by physicians.

Ruling that lay-owned or incorporated x-ray laboratories seeking licenses must be given consideration and acted upon.

Ruling that compensation x-ray and diagnostic laboratories may submit bills direct for services rendered by physicians employed by them.

Ruling that insurance carriers and employers shall pay all bills submitted by public hospitals in the City of New York which include items for services rendered by the hospital physicians. This ruling was predicated on the clause appearing in the City Charter which provides that such physicians shall serve the hospitals without compensation.

Ruling that it is not necessary to be listed on the panel of authorized physicians in order to make mere physical examinations of injured workers and give testimony for claimants at hearings, that the claimant may pay for such services, and that only such physicians as render treatment of a compensable injury are stopped from receiving fees from claimants.

Ruling that the medical amendments do not apply to dentists.

Among the difficulties encountered during the first year and a half of administering the new provisions of the Law was the abuse of the injured employee's waiver of his right to free and unrestricted choice of the physician to attend him. The Law permits employers to recommend authorized physicians to their injured employees only when a written request for such a recommendation is made by the worker. The forms in which such requests were written varied widely and many were regarded as mere subterfuges to evade the Law and compel the workers to employ a company physi-

WORKMEN'S COMPENSATION

State Industrial Commissioner Elmer F Andrews delivered this informing and important address before the Medical Society of the County of Queens on January 26 The Commissioner said in part

To insure adequate care and treatment of the injured worker is the purpose of the medical practice amendments to the Workman's Compensation Law under which we have operated for more than a year and half Underlying this purpose is a principle as old as the theory of workmen's compensation

When interpretation of the common law denied to a servant the remedy for personal injury which a stranger might obtain against a master, and later when employer liability laws permitted redress for an employee only under severely restricted conditions, it became necessary to protect a worker's physical and economic welfare by providing compensation for physical injury arising out of and in the course of employment, the cost of which would be charged against industry without inquiry into whose fault caused the injury Laws and jurists laboring under the old tradition have habitually emphasized the sanctity of property rights and been inclined to sacrifice human rights The Workmen's Compensation Laws were the most important of the earlier statutes enacted in the newer tradition of giving prime consideration to preserving human rights by governmental action

Doubtless the need for legal safeguards for workers has been impressed upon the medical profession much more widely during the past year because of the provisions of the medical amendments which give to the County Medical Societies such an important part in the administration of the Law Much of our effort under the amended Law has been to set up the administrative machinery Those operations are not yet completed nor perfect They involve innumerable details and questions which at times may seem to demand our entire attention. But we must not let this divert us from the main objective of the medical amendments, namely the welfare of the injured worker Our detailed arrangements and the answers to our questions must be pointed directly at this objective, and where any doubt arises, the benefit should be accorded the interests of the injured worker even at the expenses of others involved

In the event of equal division, the Committee shall select a fifth physician, also a member of the Medical Society of the State of New York, whose decision shall be conclusive

PNEUMONIA CONTROL PROGRAM

Prize for Report on Cases of Pneumonia

The Advisory Committee on Pneumonia Control of the New York State Department of Health offers a prize of one hundred dollars for the best report of a series of cases of pneumonia

The competition is open to all physicians residing and practicing in New York State outside of New York City. Interns in hospitals may compete but the report in all cases should include only those cases actually seen and studied by the writer, and should include all cases of pneumonia of all types and forms treated by him either in private practice or in hospitals during the present winter

In awarding the prize less stress will be laid upon the number of cases than upon the objectivity exhibited by the writer in his description of the cases and upon the originality and independence shown in the interpretation of the clinical features. Credit will be given for the extent to which the newer methods of diagnosis and treatment of cases of lobar pneumonia were employed. If the writer desires, the report may be documented by full clinical histories and laboratory reports, but the report itself should not be longer than 5,000 words and be in a form suitable for publication in the NEW YORK STATE JOURNAL OF MEDICINE

Reports should be in the hands of the Committee not later than August 15 and the award will be made October 1

Address further inquiry to

Dr Edward S Rogers,
Director, Bureau of Pneumonia Control,
New York State Department of Health,
Albany, N Y

cian This evil was met and the worker assured of the protection which the Law intends to give him by the prescription of a standard waiver form which, after requesting the employer's recommendation of a physician, contained the following reservation

Nothing herein contained shall prevent me from subsequently engaging the services of an authorized physician of my own choice for continuance of any medical treatment or care required

The question of a fee differential for upstate districts presented another difficulty not so easily solved Even with the Minimum Fee Schedule for the Metropolitan District as a basis the Medical Sub-Committee and representatives of insurance carriers, employers, insurance buyers and the State Medical Society have been unable to agree on a schedule which the Industrial Commissioner could promulgate for upstate At the upstate hearing on the proposed schedule, the physicians generally were opposed to any lower minimum rates than those already effected in the metropolitan area while employers and carriers generally believed there should be downward differential of varying degrees for different localities A compromise proposal granting varying differentials on a percentage basis of the Metropolitan Schedule was so unfavorably commented upon that the question was allowed to remain in status quo and the upstate physicians have continued to make their charges as they did under the unamended Law

Employers and insurance carriers also have raised objection to the adoption of a hospital fee schedule on the ground that the Law does not authorize the Industrial Commissioner to promulgate such a schedule, and the Attorney General has recently given his opinion that this is so In considering the proper per diem rate for hospital service, it was agreed that the insurance carriers, insurance buyers, employers, hospitals and the Industrial Commissioner each select a certified public accountant who should constitute a committee to make an audit of hospital expenses and charges and report their findings to be used as a basis for determining the minimum per diem rate for a hospital fee schedule

Due to the ambiguity of the Law, the matter of securing authorization in operative cases presents a vexatious problem The Law merely provides that if authorization is withheld by the employer or carrier, the Industrial Commissioner shall be appealed to But it is obvious that the Commissioner is not equipped with facilities for determining such an appeal Nor does the Industrial Council believe that he should attempt to assume either the medical or the financial responsibility involved The Council has taken the position that the attending physician or hospital must assume the responsibility for determining the necessity for an operation and the financial risk if the injury proves non-compensable

The Medical Sub-Committee has heard many appeals by physicians dissatisfied with ratings on qualifications assigned by Medical Compensation Boards of various County Medical Societies In the majority of instances, the Sub-Committee upheld the Boards The Law, however, fails specifically to provide the right of appeal from decisions of the Boards on applications for licenses to operate medical bureaus On this point as well as on the enforcement of payment of medical bills by non-insured employers and the penalizing of an unauthorized physician practicing in compensation cases, the Law would seem to need further amendment to clarify and implement it

Doubtless there will be many amendments to the Workmen's Compensation Law presented at the present Legislature which should receive your close study as physicians who will be affected thereby They should all be directed to the board purpose of further protecting the injured worker As I understand it, restrictions which are placed around the authorization of physicians to practice in compensation cases are not to be construed as an intent to restrict the injured worker in his choice of physician, but rather are a restriction on physicians to insure the injured worker of competent treatment Any amendments affecting this phase of the Law, I believe, should be to broaden the freedom of choice of physician rather than to limit it

WHEN THE MEDICAL MIND IS RECEPTIVE

The *Bulletin* of the Broome County Medical Society believes that medical manufacturers would do well to take space in an office building and set up displays of their

products where doctors could visit them at their leisure and learn their value It urges them, also, to do more sampling and demonstrating at medical conventions

Medical News

Secretaries of County and local Medical Societies are requested to send the programs of coming meetings to this department one month in advance, for the information of members who may be interested

Albany County

DR. JOHN J. RAINEY addressed the Eastern New York Eye, Ear, Nose and Throat Society at Albany on Jan 20. His topic was "The Nasal Accessory Sinuses."

DR. EUGENE E. HINMAN, sixty-two of Albany, died on Jan 20. He was a former president and for several years program chairman of the Medical Society of the County of Albany. "We looked upon Dr. Hinman as the foremost man in his specialty in this part of the state," said Dr. Arthur J. Bedell. "I knew he was a man on whose judgment I could always rely and in whose skill I could always place faith." Dr. Hinman's hobby was Masonry. He was master of Temple lodge of Masons, a past high priest of Temple Chapter of Royal Arch Masons, past master of DeWitt Council, of Royal and Select Masters and for a year was Grand Master of the Grand Council of that order.

Allegany County

"BLOOD BROTHERS," A GROUP OF 116 volunteer American Legion members ready to give blood for transfusions in emergency cases for the saving of life, have been listed for the convenience of physicians through a year's cooperative work by the Allegany County American Legion and the Allegany County Medical Society.

The names, addresses, telephone numbers of volunteers ready to become donors of blood on demand, along with the type to which they belong, are now on file in the office of the county bacteriological laboratory. When a demand arises suddenly for a certain type of blood in any community within the county, physicians there have but to communicate with the laboratory at the county seat to be put into touch with the person of a type best suited to any certain patient. There need be no waiting for the making of tests to determine types.

It is the consensus of opinion within the county medical society and the committee arranging the list of "Blood Brothers" that any arrangement for payment for blood given by a donor should be made between the patient and any individual of the proper type asked to aid with blood in a transfusion.

If the patient has ample means, he or she is expected to pay the donor for the assistance given.

Thus far, two men on the lists have been used for emergency transfusions. An Andover patient in a Mt. Morris hospital needed blood. The county laboratory was called and the names of Andover American Legion members of the proper type furnished the family. These two donors were taken to Mt. Morris by the family and were of immediate assistance in a transfusion operation.

Broome County

MR. SHERMAN D. MEECH, Managing Director, Rochester Service Corporation spoke on "Experiences in Hospital Insurance as carried out in Rochester, N. Y." at the meeting of the Broome County Medical Society on Feb 9.

Cattaraugus County

TWO OLEAN PHYSICIANS were the principal speakers at a meeting of the Cattaraugus County Medical Society in the Olean House on Jan 26. The speakers were Dr. L. J. Atkins and Dr. E. D. Putnam. The latter discussed varicose veins, while Dr. Atkins reported on the recent venereal disease control conference at Washington. Dr. Atkins presented a similar report at a medical society meeting in Salamanca on Jan 25.

Cayuga County

A PAPER ENTITLED "The Relation of the Sympathetic Nervous System to Problems Arising in General Practice," was read before the Cayuga County Medical Society by Dr. Frederick S. Wetherell, Associate Professor of Clinical Surgery of the Syracuse University College of Medicine, on January 21, at the Auburn City Hospital.

Chemung County

DR. B. R. KIRKLIN, president-elect of the American Roentgen-Ray Society, spoke at the first 1937 dinner meeting of the Chemung County Medical Association held in the Mark Twain Hotel in Elmira on Jan 28.

That the physicians of the State may have concrete examples of different phases of anti-pneumococcus serum treatment of pneumococcus pneumonia, there will appear here case reports selected from the large number received by the State Department of Health on the use of anti-pneumococcus serum produced and distributed by it.

In order that physicians practicing in New York City or those using effective serum from other sources may also be represented, we hope that physicians who may have had particularly significant experiences with serum will submit short reports to the *Pneumonia Editor*, *New York State Journal of Medicine*, 33 W 42 Street, New York City—Editor

Case 3

Report from the records of Joseph F Kenzie, M.D., Prattsburg

"A boy, sixteen years of age, contracted what he considered to be an acute upper respiratory infection on December 26. While the cold was apparently more severe than usual, it was not attended by any cough. About 1 day and a half later, he had a sudden chill, marked elevation in temperature, and commenced coughing and raising blood sputum.

"Examination, a short time after the development of these symptoms showed a temperature of 102.8° F, pulse 120, and respirations 24. There were no physical signs in the chest except diminished breathing over the right lower lobe.

"A sputum specimen was obtained promptly and sent to the nearest diagnostic laboratory (Bath)—a distance of about fifteen miles. Type I pneumococci were identified by the Neufeld method and a supply of Type I concentrated antipneumococcus serum (New York State Department of Health) returned by messenger.

"The patient gave no history suggestive of allergy and both the intradermal and ophthalmic tests for horse serum sensitivity were negative, so serum administration was instituted without further delay.

"The first dose of serum, forty c.c. (50,000 units) was given by the gravity method. The serum was diluted in 200 c.c. of saline and glucose solution and administered over a period of sixty-five minutes. This dose was attended by no undesirable reactions nor was there any evidence of a favorable effect.

"At 6 P.M., about one and one-half hours after the serum had been given, the temperature had risen to 103.6° F, pulse and respirations were essentially unchanged.

"At 10:30 P.M. a second dose of the same amount (40 c.c.) of serum was given by the same method, 150 c.c. of saline and glucose solution being used and the administration by gravity consuming a period of forty-five minutes.

"An hour later, the temperature had fallen to 101.8. At 8 A.M. the following morning (the second day of the disease) had reached 99, the pulse 96, and respirations 20.

"The convalescence was completely uneventful. Though the serum was felt to

have been most effectual, it is interesting to note that the course of resolution was not appreciably altered."

Dr Kenzie's case presents a number of interesting points worthy of discussion. It well illustrates the dramatic results of the adequate and very early use of serum. While it is impossible to deny that first and second day crises are occasionally encountered in cases which do not receive serum, their occurrence with Type I pneumococcus pneumonia is sufficiently rare so that such a result cannot be expected even in a young man of this patient's age.

Also, noteworthy is the manner in which this case illustrates the application of modern methods of scientific medicine in the home quite remote from the advantages of hospital and city practice.

The use of saline solution or saline and glucose up to about ten per cent is frequently recommended in serum administration. It is not, however, essential and in cases where there is some evidence of myocardial damage might even be harmful by causing too great an increase in the blood volume and load upon the heart. It has two advantages, it gives valuable fluid and chlorides and it facilitates slower serum administration. When such a method is employed, however, care must be exercised to keep the solution at body warmth throughout the period of injection.

Dr Kenzie's comment regarding the period of resolution is of interest. It has been the observation of most physicians with large experience in the use of serum in treating pneumonia, that the duration of resolution and the convalescent course are unaltered by serum, being of the same duration and requiring the same care as they would if serum had not been used. Not infrequently, in fact, the pulmonary lesion has been observed, by x-ray, to progress somewhat following serum treatment even though it has produced a prompt clinical response. The consolidated lung must resolve from whatever stage it has reached at the time the active progressive phase of the disease terminates. Serum may influence resolution only inasmuch as it aids in the earlier termination of this acute progressive phase and may shorten the resolving period in a preventive sense.

Kings County

DR. LUTHER FISKE WARREN, fifty-one, president of the New York State Board of Medical Examiners, and a medical practitioner in Brooklyn since 1912, died on Jan 18 in his home. He was formerly president of the Medical Society of Kings County. Dr Warren had been physician in chief of Long Island College Hospital and St John's Hospital, medical director of the Brooklyn Home for Consumptives and consulting physician at Methodist Episcopal Hospital, Coney Island Hospital, Harbor Hospital, Brunswick General Hospital and Lutheran Hospital.

DR. ELIAS HUDSON BARTLEY, educator and author, who was Professor of Chemistry, Toxicology and Pediatrics at Long Island College for many years, as well as chief chemist of the Health Department in Brooklyn from 1882 to 1888, died at his home on Jan. 12. He was eighty-seven. A practicing physician for more than fifty years, Dr Bartley served during his career as consulting pediatricist of several hospitals and as chief of the department of pediatrics at the Brownsville and East New York Hospitals in Brooklyn. He was formerly president of the American Society of Public Analysts, Associated Physicians of Long Island, Brooklyn Pediatric Society and the Medical Society of the County of Kings.

EARLY DIAGNOSIS and treatment is essential to the cure of heart ailments, Dr Louis F Bishop, Jr, associate visiting physician in Bellevue Hospital, Manhattan, told two hundred physicians gathered in the Aperia Manor for the installation of officers of the Ocean Medical Society, on Jan 18. Dr Harry S Levine, a member of the society, discussed "Bone Formations," and another speaker was Dr Tasker Howard, attending in medicine in Long Island University. Dr Benjamin Brodie was installed as president by his predecessor, Dr Morris Brooks. Others inducted were Dr Sidney Nussbaum, president-elect, who will succeed Dr Brodie next year, Dr Peter Kane, vice president, Dr Moses Goodman, treasurer, and Dr Harry Weiner, secretary.

THE MONTHLY MEETING of the Bay Ridge Medical Society was held on Jan 12, at the Shore Road Academy. A paper was presented by Dr Robert A. Wilson, Obstetrician at the Methodist Episcopal and St Mary's Hospitals, on "Imitation of Respiration in Asphyxia Neonatorum," accompanied by lantern slide and motion picture demonstration. In another paper, Dr Frank

Chisena summarized the autopsy findings in a series of eighteen stillborn babies.

THE RIDGEBORO MEDICAL SOCIETY held its January meeting at Gregory's. Dr Tasker Howard, professor of Medicine at the Long Island College of Medicine, spoke on "Disease of the Coronary Arteries." Dr Clifton Bogardus, president of the association, announced that the newly elected officers would be installed at the next meeting.

Monroe County

COOPERATION OF THE PHYSICIANS of Rochester with law enforcing agents in combating drunken driving was urged as a civic responsibility before the Allied Temperance Forces by Dr Floyd S Winslow, on Feb 2. Speaking at the annual dinner meeting Doctor Winslow outlined a plan for creation of a physicians' board, members of which would be on police call to examine all drivers arrested for recklessness. "Successful operation," warned the New York State Medical Society head, "calls for nerve on the part of the physician. That goes for judges, too." The physician declared that without immediate examination, it is impossible to ascertain accurately whether a driver is under alcoholic influence at the time of his arrest. A plan similar to Doctor Winslow's proposal is now being operated in Hempstead, L I.

New York County

THE NEW YORK PHYSICIANS' ART CLUB. Dr J Seth Hirsch, president, Dr Henry Bancel, vice president, Dr F Morgan Hartshorn, treasurer, will hold its Tenth Annual Exhibition from April 3 to 17, inclusive, at the New York Academy of Medicine. Original paintings, drawings, sculpture or art-handicraft by physicians are invited and must be submitted before March 13. For application blanks and full details apply to the Secretary, Dr Louis C Schroeder, 50 E. 72 St., New York City.

ELEVATION OF THE STANDARDS for medical, surgical, and social service care of diabetes patients in the clinics of New York City are the objectives of the Committee on Diabetes Clinics of the New York Diabetes Association. The Committee announces its first public meeting, to be held at Cornell University Medical College Amphitheatre, 1300 York Avenue, New York City, on March 5, at 8 30 P M. Elaine P Ralli, M D, chairman of the Committee on Diabetes Clinics, will open the program with a report on minimum requirements. The

Doctor Kirklin's address, "Clinical Indications for Roentgenologic Examination of the Alimentary Canal," was illustrated with stereopticon slides of plates made at the Mayo clinic where the speaker is head of the section on Roentgenology

Chenango County

DR EARL W WILCOX, Chenango county coroner for thirty-five years, died at the Chenango Memorial Hospital in January after a brief illness. Dr Wilcox practiced medicine in New Berlin for forty years. A past president of the Chenango County Medical Society and many times its delegate to the state conventions, he was held in high esteem.

Cortland County

DR F R THOMPSON AND DR CLAUDE E CHAPIN were reelected president and vice-president respectively of the Cortland County Board of Health at the monthly meeting on Jan. 18 at the public health office in the county building at Cortland.

DR LEO E GIBSON spoke before the Cortland County Medical Society on "Infections of the Kidney and Treatment" on January 15, at the Cortland Free Library.

Erie County

IN COMPANY WITH OTHER CITIES throughout the country, Buffalo, through the Medical Society of the County of Erie, sponsored meetings held February 5 to disseminate knowledge in regard to syphilis and at the same time to familiarize the public with what the various government and private agencies aim to do in an effort to prevent the spread of the diseases and accomplish proper treatment.

A meeting for the laity was held in the afternoon, and for the professions in the evening. Dr Paul A. O'Leary, head of the department of dermatology and syphilology, Mayo Clinic, and Dr George H. Ramsey, assistant commissioner for preventable diseases, New York State Department of Health, addressed both meetings. Dr O'Leary stressed the point that the veil of secrecy that has covered the so-called social diseases must be lifted if the drive of medical science is to succeed, and declared that the disease can be cured completely if treatment is begun soon enough. Dr Ramsey dwelt on the State's syphilis control program. He stated that it is cheaper for the State to eradicate the disease than it is to care for sufferers, and

estimated that the State spends more than \$2,500,000 annually to care for victims of the scourge treated in institutions.

The Society's Committee on Public Health, with the Chairman, Dr Nelson W. Strohm, in charge, arranged the successful gatherings of physicians, dentists, and the laity, as outlined by the American Social Hygiene Association.

DR HARRY C GUESS, Chairman of the Educational Committee of the Medical Society of the County of Erie, has announced that the committee this year will devote its activities to the presentation at various hospitals of a program on traumatism.

The course of lectures began February 18 and will continue every Thursday afternoon until April 8. The purpose is to assist the medical profession to render the very best care in the treatment of injured workers. The speakers selected have been especially trained for the subjects they will discuss.

Essex County

THE ESSEX COUNTY RELIEF Committee and the Essex County Medical Committee have agreed upon the following hospital and medical rates for county cases. Routine calls for cases in hospital not to exceed three calls in any one week without special authorization by the county commissioner or the local welfare officer. When applying for additional calls application must be in writing giving reason for same and signed by physician making application, \$1.50, emergency or first call, \$2, office calls for county cases such as boarding homes for children, \$1, house calls for above, \$2, hospital rates per day not to exceed \$3, obstetrical cases including prenatal and postnatal care up to twelve days, \$25, maximum general anesthesia when given by a physician, \$7, consultation in hospital cases when authorized by the commissioner of public welfare, \$3.

Surgical fees. Major operations, except tonsillectomy, \$50, minor operations, \$25, no x-rays without special authorization by the commissioner of public welfare or by the local welfare officer.

Prescriptions for drugs or their equivalent that are included in hospital free drug list will be deducted from the bill.

Major operations.—The opening of a body cavity or the amputation of the main part of the limb. **Tonsillectomy.**—Rates for tonsillectomy to be decided by physician and commissioner of public welfare prior to the operation. **Minor operations.**—All other operations not major requiring an anesthetic.

MEDICAL NEWS

March 1, 1937]

On Feb 19, Dr Merwyn Armstrong, F.A.C.S, Attd. Obst. & Gyn, Long Island City Hospital and Asso Att Obst. & Gyn Caledonia Hospital spoke on "Management of Hemorrhages in the Latter Months of Pregnancy"

Schenectady County

PHYSICIANS AND SURGEONS of the Capitol District heard Dr Wayne Babcock, professor of surgery at Temple University Medical School in Philadelphia, speak in Schenectady on Jan 23, at a dinner and science meeting of the Eastern New York Chapter of the Pan-American Medical Association at the Mohawk Golf Club, on "Diagnosis and Treatment of Intestinal Maligancy"

DR. LAWRENCE K. DUGAN, sixty-two, of Delanson, died of suffocation and burns in a vain effort to put out a fire that started in the living room of his home on Jan 23

According to officials of the Delanson fire department, he was found lying beside a front bay window, with an empty water pail nearby. Officials said that he had apparently been trying to battle the fire alone, and blinded by smoke, tried to get out of the house when he collapsed. Dr Dugan failed to rally to resuscitation, administered by members of the department. Two inhalators were rushed to the scene, one from the Schenectady fire department and one from the New York Power and Light corporation in Schenectady. It is thought that he fell asleep on a sofa while smoking a cigarette, which fell from his fingers and ignited the sofa or a rug

Suffolk County

AT THE ANNUAL MEETING of the Suffolk County Tuberculosis and Public Health Association on January 11 in the office of the association in Riverhead, all officers were reelected as follows

Dr Frank S Child, president, Frank B Smith, first vice president, Mrs Verne L Rockwell, second vice president, Mrs Allan Heath, third vice president, John S Howe, treasurer, Elizabeth C Wells, MD, secretary

A LETTER WAS RECEIVED at a recent meeting of the Comitua Minora of the Suffolk County Medical Society from Mrs Barnhardt, President of the Woman's Auxiliary of the County Society, requesting the approval of a resolution adopted by that organization to be submitted at the next annual convention of the Auxiliaries of the Medical Societies of the State of New York.

This resolution would require the compulsory examination of all public school teachers. The resolution was approved after being amended, that all public school teachers be required to present a health certificate and a chest x-ray picture

Ulster County

THE WINTER MEETING of the Ulster County Medical Society was held at the Governor Clinton Hotel in Kingston on Feb 2. The speaker at the scientific session was Dr W C Thompson, medical consultant division of social hygiene, state department of health. His subject was diagnosis and treatment of early syphilis

Warren County

DR. IRVING R. JUSTER AND DR. JOHN W CANADAY presented papers at a meeting of the Glens Falls Academy of Medicine on Jan 29 in the academy auditorium of the Crandall Library. Dr Juster discussed "The Significance of Rheumatic Activity in Chronic Rheumatic Heart Disease." Dr Canaday spoke on "Mumps Meningitis"

Westchester County

AS TOLD IN THE WHITE PLAINS newspapers, "Dr Benjamin F Barnes, supervisor from Yonkers' third ward, wants more identification for physicians on the highways

"A week ago Dr Barnes arrived at 3 25 as the supervisors adjourned. Yesterday he came at 3.20, his hands black from tire-changing, but still in time to present a resolution

"By its terms all physicians in the county would be authorized to equip their automobiles with signs, a bright red light on top and a siren

"Supervisor Locke, Yonkers, moved to amend 'Let the equipment also include a fireman's hat and axe,' he suggested

"Supervisor Gleeson, also from Yonkers, offered still another amendment

"And paint the picture of a stork on the side of the car,' he interjected

"The resolution was referred to the committee on legislation where today it was noticed in one of the smallest pigeonholes"

DR EDWIN G RAMSDELL, White Plains surgeon, has been reelected president of the Westchester County Board of Health. Nelson A. Rockefeller, son of John D Rockefeller, jr, was reelected vice president. He resides on his father's estate at Pocantico Hills. Dr Edward H Marsh, deputy health commissioner, was reelected secretary

scientific paper of the evening will be "Pregnancy in Diabetes," by Edward Tolstoi, M D, and Robert Gordon Douglas, M D, with discussion by William Studdiford, M D, and George E. Anderson, M D. Physicians working in diabetes clinics and all others interested are cordially invited to attend.

DR RUSSELL L CECIL, Professor of Internal Medicine at the New York Polyclinic Medical School and Hospital, gave a special afternoon lecture on January 13 on Streptococcal infections and their treatment.

At the January meeting of the Polyclinic Clinical Society, the following program was presented: "The frequent failure to recognize the presence of disease of the nasal accessory sinuses" by James W Babcock, M D, Presbyterian Hospital, (by invitation). The discussion was opened by Russell L Cecil, M D, Horace S Baldwin, M D (by invitation) and Max Halle, M D. The second paper of the evening was "Endocrine obesity in children" by Murray B Gordon, M D. The discussion was opened by Samuel Z Levine, M D, (by invitation), Irving H Pardee, M D, (by invitation) and Sidney V Haas, M D.

At the February meeting of the Polyclinic Clinical Society, the following program was presented: "The role of acute infection in hypertensive cardiac failure" by James R Lisa, M D, City Hospital of New York (by invitation). The discussion was opened by Harold E B Pardee, M D and John Carroll, M D. The second paper of the evening was "Recent advances of thoracoplasty collapse in pulmonary tuberculosis" by Pol N Coryllos, M D. The discussion was opened by George G Ornstein, M D (by invitation) and James S Edlin, M D.

The following program will be presented at the March meeting of the Polyclinic Clinical Society: "The vermiform appendix, its physiology and pathology" by H A Royster, M D, Raleigh, N C and "Carcinoma of the breast, with sound films in color" by Herbert C Chase, M D.

Oneida County

DR. M T POWERS is the new president of the Utica Academy of Medicine. He was elected on January 21, at the annual meeting in Hotel Utica. Other officers: Vice-president, Dr William W Wright, secretary, Dr F M Miller Jr, treasurer, Dr H D Parkhurst, trustees, two years, Dr R C Borst, Dr Ross D Helmer, Utica, and Dr Fred C Sabin, Little Falls. Dr T Wood Clarke delivered his address as

retiring president. Dr G M Fisher explained the institute for eradication of syphilis and the academy passed a resolution endorsing it. Speakers of the evening were Dr John H Powers, on "Congenital Bands and Adhesions About the Terminal Ileum" and Dr Meinolph V Kappius, Boston, on "Hemorrhage in the Last Trimester of Pregnancy" and "Practical Considerations in Pregnancies Complicated by Hypertension and Albuminuria."

Onondaga County

THE WOMAN'S AUXILIARY to the Onondaga Medical Society met on Feb 2 in the nurses' recreation room at the Syracuse Memorial Hospital and listened to a paper by Dr Harry A Steckel on "Mental Hygiene," followed by a social hour.

Oswego County

THE REGULAR DINNER MEETING of the Oswego County Medical Society was held at the Oswego Flks Club, on February 9. Dr Fred Hiss spoke on heart problems in relation to general practice.

Queens County

DR. HAROLD LIGGETT, Fellow of the American College of Surgeons, addressed the Queens Medical Society on Jan 22 on the "Mechanism of Hoarseness: Its Medical and Neurological Aspects," at the society building.

DR. JACK SARNOFF was installed as president of the Long Island City Medical Society on Jan 21. Dr Sarnoff is on the attending laryngological services of St John's Hospital, Long Island City, and the Queens General Hospital, Jamaica. His offices are in Astoria. Dr James Dobbins, past president of the Queens County Medical Society, was the installing officer. Other new officers of the society are Dr Arthur A Fischl, vice-president, and Dr Joseph Drago, secretary-treasurer.

MRS JOHN W MAHONEY, president of the Woman's Auxiliary to the Medical Society of the County of Queens, Inc., entertained the chairmen of standing committees at a luncheon at her home on Jan 25. Plans for the coming year were discussed.

DR CHESTER L DAVIDSON, F A C S, Asso Surgeon, Jamaica Hospital, Surgeon, Queens General and Cumberland Hospitals, Chief Surgeon at Cumberland Dispensary, spoke on "Ankle Fractures" illustrated by lantern slides, on Feb 5 at the County Society Building.

the diagnosis of the patient being treated in the rooms which he passes, according to *The Modern Hospital*. A fragrant winter-green odor suggests acute articular rheumatism or some of its variations, the spicy turpentine odor, that abdominal distension is being treated by stupes and the aromatic vapors of compound tincture of benzoin reminiscent of the North woods imply that some patient is suffering from a bronchial ailment and is using a steam generating inhaler.

Queens General Outgrowing Itself

ONLY A LITTLE MORE THAN a year ago the Queens General Hospital opened its doors to the public. Since that time, every building, every ward, and every facility of this great eleven-story institution has been in operation. The local newspapers give enthusiastic descriptions of its work. They tell us that before it had been open three months, this 600-bed hospital was operating at a near-full capacity. Now the institution is so full that Superintendent Dr. Marcus D. Kogel, who has been with the hospital since its opening, is forced to demand more beds and more space.

The rapid growth of the hospital may more readily be understood when one follows the records themselves. Figures show that at the end of 1936, over twenty thousand patients have been treated in the clinics, more than 1,200 babies born and 15,000 given hospitalization. It was constructed at a cost of \$3,500,000 after more than a decade of agitation by civic groups.

On its grounds is a power plant that generates electricity for the entire institution. There is a heating plant that serves all the buildings. Giant pumps raise water to a huge tank on the roof from which point it flows to all parts of the hospital.

A huge laundry in which all hospital linen is washed and ironed is one of the great assets. A large storage house keeps food supplies in the best of condition. There is a carpenter shop and a large garage which is maintained to service ambulances and other hospital machines.

All these facilities care for the hospital population which averages 1,300. Of these over 600 are patients while the remaining 700 includes interns, hospital helpers, cooks, attendants, nurses, cleaners, and others in

The hospital executive employing his olfactory sense is able to detect more mundane things than the diagnosis of disease. With equal certainty his sense of smell leads him to the hiding place of a sodden and unclean mop or to the existence of insanitation which careless cleaners had thought well hidden. Employing both their olfactory equipment and their supply of common sense both the physician and the hospital executive may at times display what appears to be unusual, though in reality perfectly commonplace, diagnostic powers.

perhaps another dozen trades and professions.

There are about 230 nurses and fifty interns at the institution. About 300 outside physicians come to the hospital daily. A library service is maintained at the hospital. On certain days of the week, a librarian from a branch of the Queensboro Public Library goes from ward to ward. The librarian has an office in the main building.

There are forty individual rooms for interns in the staff house, a three-story building. There are also two apartments, one for Dr. Kogel as superintendent and the other one for the deputy superintendent, Dr. Philip Kahn. In the nurses' home, which is four stories high, there are 132 individual rooms and two apartments for administrative officers. The employees' building which is three stories high, has seventy-five rooms and an apartment for the administrative officer.

In examining the figures for the last quarter, it may be noted that the death rate at the hospital is only 5.9 while the rate for all city hospitals was 8.2. There was not a single death of a mother in childbirth for the first six months that the hospital was open. Figures show that, on an average, thirty-five persons are admitted daily and thirty-five discharged. The average stay at the hospital is about ten days.

About fifteen major operations are performed daily. Each day, several hundred persons come to the hospital for everything from pre-natal lectures to treatment for the teeth. Common diseases, which do not require hospitalization are treated in the clinics.

Working in close cooperation with physicians handling both in-patients and out-

Hospital News

Present Status of Hospital Insurance Plans

OUT OF 172 GROUP hospitalization and hospital insurance plans recently addressed by the Bureau of Medical Economics of the American Medical Association, ninety were found active and eighty-two inactive. Of the active plans, fifty-six were found to be operating and thirty-four in the state of established proposals. Fourteen new plans have recently been proposed. Thus the present status may be defined, remarks the *AMA Journal*, as one of active experimentation in an effort to find out the workable features and thus maintain systems capable of meeting existing needs. Various investigations indicate that somewhere between 500,000 and 700,000 persons are now members of such plans. Incidentally, three plans have fifty per cent of the entire membership, and ten plans have eighty per cent of the entire membership.

In Chicago, the plan proposed through the Hospital Council involved the setting up of a hospital service corporation as a nonprofit corporation, organized under the Illinois act exempting a nonprofit service corporation from the insurance code of the state. This plan has been under active consideration by a committee of the Chicago Medical Society which proposed six requirements before it could place the approval of the Chicago Medical Society on the plan. Of these, the chief demand is that all matters of medical administration and medical policy be referred to the Chicago Medical Society whose decision in these instances shall be final and binding both on the Chicago Hospital Council and on its member hospitals.

Unfortunately, the Council of the Chicago Medical Society has not yet accepted the report of its committee, owing to the apparent insistence of one of its members that the medical society do not enter into the arrangement unless it has a guaranty of fifty-one per cent of the directorate, an insistence to which the Hospital Service Corporation may hesitate to consent.

It is interesting to realize that Chicago has already had ten group hospitalization plans besides the Hospital Service Corporation, not one of which has attained even slightly significant proportions. Two of these plans were organized under the same law that created the Hospital Service Corporation and both secured articles of incorporation notwithstanding the fact that they were promoted by hospitals considered to be unable to give first class service.

Another unfortunate aspect of the situation is the fact that the propaganda and promotion associated with the Hospital Service Corporation have brought into the field various unethical imitators, one of them advancing himself by the circularization of the public in his vicinity with a schedule labeled the Chicago Hospital Service Plan, a vague imitation of the proposition advanced by the Hospital Service Corporation. It will apparently become the obligation of those who actively promote such plans under legitimate auspices to protect the public at the same time against illegitimate promoters, through exercising the rights of any business group to the protection of their names and style in the courts.

The Doctor's Nose Knows

THE PHYSICIAN MUST EMPLOY to the fullest degree all of his special senses if he is to diagnose and treat disease successfully. It has even been hazarded that a sixth sense, usually called "common," is necessary in unraveling a complicated diagnostic problem.

The olfactory sense is not the least needed by the doctor in the pursuit of the art and the science of medicine. He is often able thereby to diagnose chronic nephritis by the

uremic odor of the patient and diabetic coma by its distinguishing sweetish acetone odor. A patient suffering with typhoid fever is said to emanate a mousy odor and he who is unfortunate enough to suffer from acute articular rheumatism has an acetic acid aroma.

Moreover, the skilled physician who passes down a hospital private floor corridor may often guess by the use of his olfactory sense

A NEW MUNICIPAL hospital is under construction at Oneida

. . .

CONTRACTS WERE AWARDED in January for an addition to the Lockport City Hospital to cost about \$150,000

. . .

WORD HAS BEEN RECEIVED by authorities of the University Hospital of the Good Shepherd, Syracuse, that its tumor clinic has been added to the list of approved clinics published annually by the American College of Surgeons. In New York State only eight other tumor clinics outside the metropolitan area have received this recognition

. . .

PRIVATE HOSPITALS which care for the indigent sick will receive \$6,472,000 as a contribution from the city this year, Dr. S. S. Goldwater, Hospital Commissioner, said on Jan. 30. The Board of Estimate, he explained, had set aside this sum, \$129,000 more than was allotted in 1936, for the use of these private institutions of which

patients, is a social service group which is composed of six workers and a director. This group serves as a liaison agency be-

tween the doctor, patient and his or her family. Workers call on the patients to find out their social and economic background.

White Plains Hospital to be Noiseless

The new White Plains Hospital, preliminary plans for which were recently announced at a dinner in Rye, will be as nearly noiseless as a hospital can be made, according to press reports.

The reason for this feature is that Leonard Schultze of Schultze & Weaver, New York architects, who drew the plans for the proposed building, was disturbed by noise when he was a patient in the present thirty-year-old structure.

Mr. Schultze, whose firm designed the new Waldorf-Astoria Hotel in New York, concentrated on the elimination of noise in preparing plans for the new \$1,200,000 building, funds for which are now being raised. The campaign will be conducted throughout the Winter and Spring, and construction will start at an early date, according to John W. Appel Jr., president of the hospital. Headquarters for the campaign are at 8 Church Street, White Plains.

The plans call for a modern central unit and west wing to replace the present main wing, and the remodeling and expansion of the present east wing. The east wing was built a few years ago and is of modern construction. Bed capacity will be increased from 120 to about 200 beds.

The noiseless feature will be accomplished in part by building all rooms on the south side and by the elimination of all automobile traffic and parking from that side of the building. At present the parking space and ambulance entrance are on the south side. These will be replaced by gardens.

Another feature will be the arrangement

of rooms for private patients along the corridors in an oblique manner so that a corner of each room comes out to the southern building line. In the triangles created by the space between the rooms will be porches, one adjoining each room. Construction will permit beds to be rolled onto the porches. Structural glass will be used extensively throughout the six-story building.

The object of the Hospital Board of Governors, as stated in literature prepared for the campaign, is to create not only adequate modern hospital facilities for White Plains and adjoining communities, but to provide a medical center as a clearing house for technical information for surgeons and practitioners.

"The present plant," said the board's statement, "is totally inadequate to meet the need of the community today. The simple fact is that the community has completely outgrown the hospital's existing facilities. To provide better as well as more care, the hospital desires to complete a program of affiliation with outstanding medical institutions in New York City."

The hospital recently became associated with Memorial Hospital for the Treatment of Cancer and Allied Diseases. In the new building "an unusual degree of privacy will be afforded to ward patients," no ward will have more than ten beds, there will be an auditorium seating 250 persons for medical and public meetings, a lecture room will adjoin the operating suite, galleries built for students and visiting physicians in the operating rooms and solarium on each floor.

Improvements

A \$3,000,000 BUILDING group for disturbed patients at the Rockland State Hospital, Orangeburg, is under construction.

THE DEPARTMENT OF HEALTH of New York City has filed plans for a seven-story building, at a cost of \$400,000, to be used for teaching health education and health administration. The building will be erected at 600 West 168th Street, and will form

part of the Columbia University-Presbyterian Hospital Medical Center adjoining

ADDITIONS AND CHANGES will be made at the nurses' home of the Homer Folks Tuberculosis Hospital at a cost of some \$20,000.

A NEW HEATING and refrigerating plant is nearing completion at Coney Island Hospital.

March 1, 1937]

A NEW MUNICIPAL hospital is under construction at Oneida.

. . .

CONTRACTS WERE AWARDED in January for an addition to the Lockport City Hospital, to cost about \$150,000

. . .

DR. FREDERICK E CLARK, city health officer of Ogdensburg, is starting an agitation for an isolation hospital there for contagious diseases

. . .

ALL CONTRACT WORK on the new Bath Memorial Hospital is practically completed, and the hospital authorities expect soon to announce the opening date.

. . .

THE JAMESTOWN GENERAL Hospital is equipping a new maternity unit at a cost of \$12,000

THE BOARD OF THE J N Adams Hospital at Perrysburg has passed a resolution asking for additional facilities, and plans and specifications have been completed for new buildings PWA aid will be requested Scores of tubercular patients have had to be put on the waiting list for lack of room

. . .

DEPUTY HEALTH COMMISSIONER J H Collins, of Schenectady, is urging that an addition to the City Hospital be built to care for mental patients In his report Dr Collins also calls attention to the "particularly disgraceful" conditions at the Health Center on Union Street, where additional space is needed, and where renovation of the building should be made immediately "to decently render service to the tremendous demands upon it."

Newsy Notes

THE WHITE PLAINS HOSPITAL has passed its fifth consecutive year without a single maternal death. The record covers 1263 maternity cases . . .

NEW BABIES ARRIVE at the Beth Israel Hospital, in New York City at the rate of five a day Fewer than 100 American cities have birth rates of this figure

. . .

THE FIRST NURSERY school in the United States which will be attended both by children whose hearing has been impaired and by those who are entirely normal will open in St Mary's Hospital for Children, Inc. 405 West Thirty-fourth Street, under the sponsorship of the New York League for the Hard of Hearing, Dr Edmund Prince Fowler announced on Jan. 20 Dr Fowler, who presided at a meeting of the Section of Otolaryngology in the Academy of Medicine, disclosed that the school would be directed by Mrs Irene B Young, who is secretary of the American Nursery Schools for Speech and Hearing He said that there was a need for hundreds of similar schools to ameliorate the disabilities of handicapped children

. . .

NEGOTIATIONS ARE UNDER WAY to settle

the differences of Oswego Hospital and the city of Oswego over fees for the care and treatment of welfare patients

. . .

A COMMITTEE TO INVESTIGATE the possibility of Rome's participation in a Central New York group hospitalization plan was appointed at a meeting of the Rome Hospital Board of Managers on Jan 19

. . .

WORD HAS BEEN RECEIVED by authorities of the University Hospital of the Good Shepherd, Syracuse, that its tumor clinic has been added to the list of approved clinics published annually by the American College of Surgeons In New York State only eight other tumor clinics outside the metropolitan area have received this recognition

. . .

PRIVATE HOSPITALS WHICH care for the indigent sick will receive \$6,472,000 as a contribution from the city this year, Dr S S Goldwater, Hospital Commissioner, said on Jan 30 The Board of Estimate, he explained, had set aside this sum, \$129,000 more than was allotted in 1936, for the use of these private institutions of which

there are 105 "This sum, however, is far below the actual cost of caring for city cases in private institutions," said Dr Goldwater. Actually, the \$3 daily rate paid by the city for acute medical and surgical cases is only about one-half of the average cost of maintenance, after eliminating from the calculation the value of free services of the physicians and surgeons in attendance

. . .

THE FELLOWSHIP COMMITTEE of the Hospital for Joint Diseases announces the award of the Mr and Mrs Frederick Brown Orthopedic Research Fellowship to Aaron M Gold, M D, for the year 1937. The Fellowship carries with it an honorarium of \$1,200 a year and complete maintenance at the Hospital. Each year a candidate is selected on the basis of education and experience in research as well as ability on the part of the candidate to do original investigational work. In January 1936, Dr Gold was awarded the same fellowship, the present award being a re-appointment. He will continue his research work in orthopedic surgery at the above hospital for 1937

. . .

THE NEW YORK HOSPITAL has added a clinic for instruction of physicians, interns and students, in the treatment of syphilis and epidemiological methods of study of the disease. The Milbank Memorial Fund aided in financing the clinic, ultimately intended to be part of the district training and health center of the New York City Department of Health. The Cornell Medical School has assigned part of its property on which the center will be built

. . .

SYDENHAM HOSPITAL ANNOUNCES that, due to rearrangement of the interne schedule, it will have two vacancies for July 1, 1937: one, a six months' houseship in pediatrics and ear, nose and throat, the other, a twelve months' appointment consisting of six months of rotating seniorships and six months' house on pediatrics and ear, nose and throat.

. . .

THE VALUE OF HOSPITAL LIBRARIES to patients has been proved, but few hospital superintendents have been able to establish such a service due to the cost involved

However, when a public library is maintained in the community its facilities should be available to hospital patients. In one city, the public library maintains a sub-station in the hospital and sends a librarian to the hospital three times a week to issue books to the patients. If the patient leaves between visits, the nurse on the floor is responsible for returning the book to the sub-station. This plan has proved workable at little expense and trouble to the public library and with the loss of only nine books in over two years—*Lewis E Jarrett, M.D., Hospital Division, Medical College of Virginia, Richmond, Va., in The Modern Hospital*

. . .

IF, AS YOU WALK INTO the Western Pennsylvania Hospital in Pittsburgh, a young woman in a smock approaches you with a "May I help you in any way at all" expression on her face, you can safely relax and know your worries are over. You have been temporarily adopted by a member of the Junior Committee, says *The Modern Hospital*. Many years ago the first group of junior volunteers was organized. These girls were stationed in a receiving line as hostesses. Their willingness invited more responsibility. Student nurses gradually surrendered minor duties to the volunteers, who now do a considerable variety of hospital work. The Junior Committee operates somewhat as a club. Its membership is limited to seventy-five and new volunteers come in by nomination. Their working hours are in the morning, the hospital's busiest time, and they appear with salary earning regularity. Their duties are legion. They carry messages, they read letters and books to the sick, they talk to lonesome patients, they write letters, they help to guide and roll occupied beds from different parts of the hospital, they roll bandages, they remind clinic patients of their appointments, they do filing, and, on the operating room floor, they are the connecting link between the surgeons and the rest of the world

. . .

ALTHOUGH THE OPERATING loss of the Peekskill Hospital in December was \$646 96, income from investments and subscriptions brought in sufficient to enable the institution to show a profit of \$334 34

A HOSPITAL INSURANCE PLAN for employed persons went into operation in Jamestown on Feb 1. The rate is 65¢ a month, or \$7.80 a year, and includes twenty-one days hospital care in semi-private accommodations, operating room service, laboratory service, customary drugs and dressings, anesthesia, and x-rays

. . .

BONE OR JOINT TUBERCULOSIS in children, which formerly comprised the bulk of cases at the Children's Hospital Home, in Utica, is decreasing markedly there. Report to this effect was made at the annual meeting of the Board of Managers by Dr C H Baldwin, chief of staff, who declared that relatively few new cases of this kind are now appearing. However, non-tubercular affections of the bone are increasing, either due to coincidence or to lowered vitality brought on by poor and less food during

the financial depression. The physician also found that the number of cases resulting from rickets are much less common and in this connection spoke of the preventive work of baby welfare organizations. As to infantile paralysis, the report notes that there have been few save sporadic cases during the past two years

. . .

ROME HOSPITAL has increased its rates for all patients, including relief clients. For the latter the ward rate has risen 75 cents to \$3.50 a day. In addition, each patient will be charged a \$2 laboratory fee. Heretofore this charge was not assessed in relief cases. The hospital action is based on recommendation of Frederick Hart, auditor for the state controller's office, that its rates be adjusted so that revenues will balance expenditures. The increase will mean a rise of approximately twenty-seven per cent.

LORENZ J. BROSNAN, Esq.

Counsel, Medical Society of the State of New York

Emergency Treatment of Nose Bleed

A doctor engaged in general practice happened to be in a drugstore when a boy came in the store asking the druggist for a doctor, stating that his sister was bleeding badly.

The doctor immediately went with the boy to his home and found a young woman lying in bed holding a bloody towel to her nose. At her side was a basin partially filled with blood. The patient was in a semi-comatose state, her pulse was rapid, and she was bleeding profusely from her mouth and right nostril. From the amount of the blood present the doctor concluded that she had been bleeding for some time. He noticed a bottle of adrenalin on the table beside the bed with which her family had tried to stop the bleeding. He realized that the case was an emergency one and attempted to stop the flow of blood by using the adrenalin but was unable to do so. He thereupon directed the boy to go to the drugstore for a solution of ferric chloride.

The doctor tried to determine the site of the bleeding but the flow of blood was so profuse that he could not find it, although he concluded that it came from the right nostril. When the ferric chloride solution was brought to him he stopped the bleeding by using the said substance, packing the nostril with cotton with a few drops of ferric chloride applied thereto. The bleeding subsided and the patient became comfortable, so the doctor left the patient instructing her to remove the packing slowly in about an hour if she felt no more

bleeding. He further left instructions that she should communicate with him if there were any untoward developments. The doctor never saw the patient again professionally.

Subsequently a malpractice action was instituted against the doctor charging that he had been guilty of malpractice in administering a caustic to the patient with the result that the said substance had burned the plaintiff's nostril so as to cause a permanent disfigurement.

The case came on for trial as a non-jury case. The plaintiff testified that when she called the defendant she was suffering from a mild nose bleed which the defendant treated with a caustic substance which caused disfigurement of one of her nostrils.

The defendant's testimony was that when he treated the patient he was confronted with a definite emergency and that it was necessary for him to employ a strong caustic in order to prevent the patient from bleeding to death. The defendant also testified that from the subsequent history of the case it was apparent that the patient had failed to follow his instructions in keeping the cotton in the nostril too long.

The court handed down a verdict in favor of the defendant and expressly ruled that in the opinion of the court the defendant had found the plaintiff in a critical condition and had been obliged to use emergency methods to meet the situation, thereby giving full credence to the defendant's version of the case and exonerating him from the charge of malpractice.

ACT PROMPTLY

Physicians can avoid financial inconvenience and unpleasant friction by prompter compliance with the clerical requirements of the amended Workmen's Compensation Act. Annoying as the routine of form filing is, it is an inescapable feature of large scale enterprise. The practitioner engaged in compensation practice cannot evade it. Punctual attention to the rules reduces it to a minimum, says the *New York Medical Week*.

As soon as treatment is completed in a compensation case, the physician should report it closed and send in his bill. When this step is delayed, so is payment, and settlement of the worker's claim must also be postponed. This is an injustice to all concerned. The doctor resents it when the carrier holds up his check. There is equal cause for recrimination on the part of carrier and claimant when the practitioner fails to carry out his part of the bargain.

Across the Desk

"Rich Man's" and "Poor Man's" Medicine

THE DISPATCHES FROM Washington say that some of the leaders of labor who were formerly against socialized medicine have been won over, and now favor it. If so, it must be that they have not thought the thing through, and do not realize where it would land the labor union members and their wives and children.

For the socialization of medicine would split medical practice and treatment at once into two distinct classes—panel* practice and private practice. The panel practice would be "poor man's" medicine, the private practice would be "rich man's" medicine. The evils certain to taint panel practice in our peculiar political system have been told a hundred times, it is into that medical morass that these labor officials now lightly propose to lead the workers and their families.

At present the American laboring classes enjoy the same medical care as everyone else. The banker may perhaps have a large corner room on the quiet side of the hospital, with flowers on the table and special nurses to smooth his pillow, but in the operating room Jack is as good as his master, and every one gets the same attention, the same care, the same skill. When the banker has a pain, he goes to Dr. A or Dr. B. When Jack has a pain, he goes to Dr. B or Dr. A. The only difference is that the banker gets a bigger bill.

A Quick Decision Imperative

It is strange that the labor leaders should be so blind to the marvelous medical position that the workers now enjoy. The worker is today on a equality with the millionaire in medical treatment, but evidently that won't do. A special form of class medicine a "poor man's" kind of medicine, is to be created for the worker. The unenviable life of the panel doctor has been vividly painted by the officers of our state and county societies in public addresses. It will be to these harrassed and overworked

physicians that the workers will be sent. An American doctor visiting England a year or two ago was told of the fine efficiency of a panel practitioner over there who could railroad thirty patients through his office in sixty minutes. That is a sample of "poor man's" medical treatment. Do our workers want it? If not, now is the time to decide, before it is too late.

A root error at the bottom of the wrong thinking about socialized medicine is the assumption that any one doctor is just as good as any other doctor. At present the worker can pick his own physician, under socialized medicine he can choose only among the panel doctors. Are the panel doctors likely to be better or poorer than the ones in private practice? It would be invidious to cast the slightest reflection on any medical man who may be thinking of going in for state medicine, but would it be human for a man who could make a good living in private practice to accept instead a poor living on the panel? Would or would not state medicine be likely to sort out the physicians into two lots, the "rich man's" doctors and the "poor man's" doctors?

This splitting effect of state medicine has not been stressed very fully before. It is of the first importance to the classes who will be relegated into the "poor man's" medical category, and they should be awakened to its possibilities.

The uninformed and unenlightened masses of the population, who pour noxious patent medicines down their throats like the Ohio and Mississippi floods, have little idea of the complexities of their own inner workings and disorders. Millions of our people think that when you have a cough you just take cough-drops, when you have a headache you take headache-powders, and when you have the bellyache you take a pill. It seems the apex of logic and sense to them that medical treatment should be put on a mass basis, like the production of Ford cars, "modernized," brought "up to date." What they may find is that they have put themselves out on the end of a limb, and sawed off the limb.

*From the legal term, panel, a list

ACROSS THE DESK

Number 51

A Sinister Possibility

A still darker possibility is suggested to the mind as one reads articles appearing in the magazines about the workings of the old-age security act. The old age security plan and any plan of state medicine are similar in that millions will be listed, with certain vital facts about their names, ages, marriages, etc., etc. Now it turns out that many, many people do not wish these facts made public. Life is often a tangled skein, and lots of perfectly good folks are hiding little slips that would raise hob if dragged out before the public eye and bandied about by the merciless tongue of gossip.

True, the returns under the old-age security act are "confidential." That is, they are "confided" to hundreds of thousands of petty clerks who may be ninety-nine per cent high-minded and strictly honorable. But what about the other one per cent? How about the blacklegs and scalawags who may worm themselves into positions of access to information useful for blackmail?

If this danger is present in the old-age security listings, how much more will it obtain in a medical category. How many are going to like it to have their intimate ailments written in card catalogues at city, town, and county headquarters, for boy and girl clerks to pore over? Every physician is the repository of confidential information which he holds sacred. That is one of the fine features of our present medical system. But that is old fashioned. Our illnesses must be socialized, regimented. The illnesses of Mrs. Smith must be set down on her card, where the daughter of Mrs. Jones will see it "confidentially" and "confide" it to her home folks and a few of the neighbors.

A brisk business is said to be carried on in the sale of lists of persons with incurable ailments who make good "prospects" for the sale of vile nostrums which are paraded as cures. What a source of information these card catalogues would be for clerks with an eye to making a few dollars on the side. If state medicine comes, the nostrum makers may well look forward to enlarging their plants and arrange for more copious supplies of colored water.

An Opportunity for Evil Minds

An article in the *Saturday Evening Post* by the assistant managing editor of a metro-

politan daily newspaper throws significant light on this subject. Mr. G. R. Alexander was placed in charge of a question-and-answer column of his paper on the social security act. He was amazed at the confessions of some of the readers who found themselves in a quandary of one sort or another. "Some," he writes, "go so far as to put down in black and white facts which could cause them to lose their jobs, break up their homes, be ostracized by their friends, and even to be deported or sent to prison. Ninety per cent of them sign not only their correct names, but their addresses as well."

All sorts of people, too, it appears, have these shady spots in their past which they fear will be dragged out into the light by this so-called "security" plan. There are manufacturers and mechanics, brokerage statisticians and penny-candy salesmen. Their secrets range from illegitimate births, secret marriages, falsified ages and criminal pasts on down the line to business strategy, wife desertion, bigamy, illegal entry into the country, falsification of income-tax returns, and outright felonies.

The thought that rises at once is the opportunity these human catalogues will offer to the evil-minded, and the catalogues of ailments under a socialized medical plan would offer another. Have the leaders of labor considered the unfortunate and even tragic features of the plan to which they have been so easily converted?

No "Security" for Medical and Health Workers

Doctors are not eligible for the benefits of the old-age security act, as they are supposed to be in business for themselves, and must provide for their own protection from the storms of life's winter. Nurses, too, are likewise out in the cold. A nurse wrote to Mr. Alexander:

Will you be good enough to advise whether graduate or practical nurses on private duty are eligible for monthly pension?

How can a nurse have a registration card when the work is so unstable, and when she changes her employers so frequently? I have had three patients in less than a month—two died and one was taken to the hospital.

To this he replies:

Who will look after the nurse when she is sixty-five? She is unprotected, not for the

grim reasons she fears, but because she sets her own fees and is her own boss and therefore, is considered an independent contractor under the law

It is not so easy to see why hospital workers are excluded Mr Alexander quotes this inquiry

How will the Social Security Act work out for the thousands of men who are employed as ambulance drivers, engineers, firemen, orderlies, and so on, in hospitals and institutions?

We have men working in this hospital from twenty-five to thirty years What is to become of them? If they leave here now, they are too old to get a job in industry I, myself, have been driving an ambulance here for eight years and am fifty

The reply is that Congress made some strange exclusions when it framed this law Hospital workers are not the only ones forgotten

Congress excluded employees of non-

profit institutions operated for religious, charitable, educational, literary and scientific purposes, officers and crews of vessels documented under the laws of the United States or of any foreign country, employees of national, state and local governments, domestic and agricultural help, soldiers and sailors and railroad men—who have a pension, plan in the Railroad Retirement Act.

Here, then, are the doctors, the nurses, and the hospital workers of all kinds left outside of the benefits of old-age security—the very ones who are helping people to live to old-age! Perhaps they are expected to wear themselves out in the task, and drop off in middle life! The anomalous situation suggests the idea, if practical, of forming an association of all medical and health workers to provide an old-age security of their own, more generous and worthwhile than the scanty and, in some cases, begrudging allowances in the governmental schedules

To Bring Pharmacy Back to the Pharmacy

THE BACK-TO-THE-FARM movement has been going on for some time, now we are to have a back-to-pharmacy movement It is something like "China for the Chinese" or "America for the Americans," only it is to be "Drugs for the Druggist," according to an announcement recently made by Harold Hutchins, managing editor of *American Druggist*, sponsor of the movement For many years the pharmacy has been the place to go for ice-cream sodas, beauty preparations, cigarettes, books, and a thousand other things, with the prescription department tucked off in a rear corner, hiding its head as if ashamed to be there

But now Cinderella's day has come The prescription counter is to have its own again Pharmacists have waked up to the fact that it is really the heart and soul of their business and their profession, and a nationwide appeal is going out to the doctors to "Write more prescriptions!" Pharmacists declare that many doctors merely say in an offhand manner to the patient "Get an eight-ounce bottle of this or that, take a teaspoonful in water after meals, and if you are no better in a week give me a ring" That sort of thing, they add, starts a large amount of self-medication and exchange of lay medical advice all around town that is harmful to the doctors and

patients both So, "Write your prescriptions!" and not only the doctor's purse and the patient's pulse will show improvement, but the little old prescription counter will become a big new prescription counter and will count more prescriptions and more dollars—millions more

For the men behind the new move reckon that some \$65,000,000 of new prescription business will be added to the present \$140,000,000 if the doctors will put their prescriptions on paper after the magic R, and \$35,000,000 more will follow in other medical and sick-room supplies

The appeal is going out over the radio, and in direct mail to doctors and druggists, and in a big advertising campaign It need only be added that medical journals all over the country have been warning the medical men for years against loose and careless prescription practices that lead the patient to believe he can diagnose and prescribe for his own ailments If druggists and doctors can get together and put the prescription business on a sound basis, certainly everybody will benefit by it.

One interesting development is that pharmacists are now even trying to make their shops smell like the old-time drug-store, and drug-trade journals tell what to sprinkle around to give the odor of years ago

Books

Books for review should be sent directly to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N. Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

Favourite Prescriptions Edited by Sir Humphry Rolleston, M.D. & Alan A. Moncrieff, M.D. Octavo of 227 pages. London, Evre & Spottiswoode, 1936. Cloth, 10/6.

This is a series of eighteen articles on hospital pharmacopoeias originally published in *The Practitioner*. The favorite prescriptions of St. Bartholomew's, London, Guy's and the other main hospitals of Great Britain are given. Each article is written by a physician of that particular hospital.

There is considerable of historic interest in the book, as some of the formularies date back to the middle of the 18th century and some of the prescriptions are linked with the names of famous physicians. Guy's pill of mercury, squill, digitalis leaf and hyoscyamus, a mid-Victorian formula, must be regarded, according to Mutch, as the forerunner of the powerful mercurial diuretics of recent years. Mercurial diuresis is said to have been recorded in the 18th century but the knowledge soon lost and rediscovered in 1886.

The article from St. Mary's Hospital by C. M. Wilson is one of the best. He casts doubt on the efficacy of some of the old-fashioned remedies and notes the more frequent use of the active principle uncombined. In 1788 it was the custom to retain some prescriptions, "innocent in themselves, out of tenderness to the feelings of some contemporaries."

An account is also given of the National Formulary for National Health Insurance purposes.

W. E. McCOLLUM

The Operations of Surgery By R. P. Rowlands, F.R.C.S. & Philip Turner, F.R.C.S. Eighth edition, volume 1. Quarto of 1045 pages, illustrated. Baltimore, William Wood & Company, 1936. Cloth, \$10.00.

The first volume of this 8th edition, which is a direct descendant of the "Operations of Surgery" by the late W. H. A. Jacobson, is an attractive textbook. It describes operations of the upper and lower extremity, head and neck, chest and vertebral column. The language is lucid and forceful, the illustrations adequate for anyone who has some knowledge of surgical

principles. The anatomical descriptions are pertinent and no obsolete methods of procedure are included. This is a welcome feature of the work. It is not meant to displace more specialized volumes on regional surgery and therefore is not as complete as a specialist would like to see it. The sterling qualities of the book will undoubtedly cause it to supplant many textbooks on this subject now cluttering the shelves of surgeons.

GEORGE WEBB

Research in Dementia Precox (Past Attainments, Present Trends and Future Possibilities) By Nolan D. C. Lewis, M.D. Octavo of 320 pages. New York, The National Committee for Mental Hygiene, 1936. Cloth, \$1.50.

This book is an ambitious attempt to comprehend all that is known (and unknown) about dementia precox. It is not intended for the general practitioner who would soon find himself lost in a vain effort to follow the bewildering array of facts and theories about this complicated disease. Dementia precox presents many difficult problems. We know nothing about its etiology, the factor or factors which singly or in combination bring about this disease.

Neither psychoanalysis nor any other forms of therapy have favorably affected it. The excursions into psychology, psychobiology, the study of the "man as a whole," have somehow missed the path that will elucidate the etiology of this disorder, and without etiology we are groping in the dark. The investigations of innumerable workers in this field of medicine have resulted in much theorizing. They often explain the symptoms but do not explain the disease. When a person reflects that dementia precox has been studied from the ethnographic, biologic, biochemical, psychologic and psychoanalytic viewpoints, he is filled with awe before a disease which has thus far resisted penetration. The most recent and noteworthy achievement has been in the employment of insulin in the treatment of dementia precox. The accounts so far have been most encouraging. Perhaps we are on the threshold of a new discovery.

ORDERING BOOKS

As a service exclusive to our readers books published in this country may be ordered through the Business and Editorial Offices of the Journal (33 W. 42nd St., N. Y. C.) postage prepaid. Order must be accompanied by remittance covering published price.

which would put the whole problem on a biochemical basis

Dr Lewis discusses these various topics in an interesting and up-to-date manner

JOSEPH SMITH

Surgical Diseases and Injuries of the Genito-Urinary Organs By Sir John Thomson-Walker, F.R.C.S. Second edition, revised. Edited by Kenneth Walker, F.R.C.S. Quarto of 974 pages, illustrated. Baltimore, William Wood and Company, 1936 Cloth, \$10.00

This is the second edition of a work which was brought out originally in 1914 and which has been a standard textbook in England ever since. The present work represents a thorough revision and where it is required by the rapid advance made in urology during the last twenty years, new chapters have been added

The book is written in classical textbook style, sections are devoted to each organ in turn, kidney, ureter, bladder, etc. and in each section there are separate chapters taking up in regular sequence, anatomy and physiology, abnormalities, injuries, infections, etc

The whole field of urology is covered, and in order to do this it has been necessary to present the subject matter rather briefly. It is, however, presented very clearly. In many instances, where there are various methods of handling certain problems, the author merely mentions other methods and briefly but clearly describes his own choice, including operative procedures

The bibliography is good and the work is well-illustrated

It should provide a most excellent textbook for students, the general practitioner who wishes to familiarize himself with

modern urology will find it easy reading and, of course, every urologist will want to add it to his library

N P RATHBUN

Administration of Workmen's Compensation. By Walter F Dodd. Octavo of 845 pages. New York, The Commonwealth Fund, 1936. Cloth, \$4.50

This detailed study of the major problems in administering Workmen's Compensation is most timely, as well as most valuable, to all who have anything to do in deciding the many technical questions arising in this social problem now twenty-five years old. The work was started by Mr Dodd when a professor in the Yale Law School and was limited at first to a discussion of the law as enacted in Massachusetts, New York and Pennsylvania. Soon it had to include California, Illinois and Ohio. Other States enacted laws and it all became a most confused problem. This study compares the experience in every section and points out the good and weak points of each state. Chapters eleven and thirteen seem to give the information that is most valuable for those who are not interested in all the legal details, but have close relation to the problem. To those who are connected with Compensation Bureaus, Industrial Bureaus, Insurance Carriers, Self Insurers and more particularly those of the Medical Profession who represent the physicians in their relation to the foregoing bureaus, etc., will do well to secure this valuable book for their personal information and guidance. The book contains end results of many investigators, lawyers and commissions

EUGENE W SKELTON

TO MAKE SYPHILIS TRANSMISSION A CRIME

In France and her colonies there are supposed to be about 1,200 licensed brothels. Of late there has been alarm in these establishments, says *The British Medical Journal*, because of an apparently well-founded rumor that the new and enterprising Minister of Health, M. Henri Sellier, proposes soon to introduce summary legislation with regard to them. Intelligent anticipations of his reforms, which may come over-night, suggest that he may make the transmission of venereal disease a criminal offence. Compulsory treatment of venereal disease free of charge is also expected to be a feature of his legislation. There is a prospect,

too, of organized warfare on the innumerable camp-followers of prostitution, from the whispering shadow who appears suddenly from nowhere and offers obscene pictures for sale, to the proprietor of hotels letting out bedrooms for about an hour at a time. The capital invested in the brothel traffic must surely approach astronomical figures, and M. Sellier's prospective attack on this vested interest will earn him the vituperative animosity of thousands of electors. A recent defence of the licensed brothel in the French medical press made strange reading

CESAREAN SECTIONJAMES KNIGHT QUIGLEY, M D, F A C S, *Rochester**Chairman, Sub-Committee on Maternal Welfare of the Committee on Public Health and Medical Education of the Medical Society of the State of New York*

Cesarean section with its recent modifications is an invaluable procedure of the obstetrics of today. However, its popularity due in part to its simplicity of performance has laid it open to criticism and many recent studies on maternal mortality have emphasized the fact that resort is had to this operation far too often. Indications for its use have become too broad, and the mortality in general is greater than it should be. Cesarean section too often is considered an obstetric panacea—a key to unlock all difficulties pertaining not only to delivery but to pregnancy as well. As an example of this might be mentioned uterine inertia, eclampsia, rigid cervix, etc. This blind confidence in a single measure unfortunately pervades the laity as well and the first question asked after an obstetric accident to either mother or baby is apt to be, "was a cesarean section done?" the implication being that had the woman been delivered by the abdominal section, the outcome would have been favorable. Twenty years ago Rudolph Holmes¹ said "Many a cesarean section has been done for indications which have been exceedingly specious, indications which are far-fetched. Many of these operations are exemplifications either of the lack of judgment in placing indications or of ignorance of true obstetric facts."

J Whitridge Williams² in 1917 said

Generally speaking, I consider the opera-

tion is being abused in two ways, first, that it is frequently employed unnecessarily, and secondly, that even when strictly indicated, it is not always performed at the time of election, with the result that its mortality becomes needlessly high. The prime factor in bringing about this abuse is defective medical training, with consequent ignorance of the wonderful adaptability of nature, and of the resources of obstetric art."

If these indictments were true twenty years ago they might be pressed with equal insistence today, for the incidence of cesarean section has increased in general, and in some hospitals from one hundred to three hundred per cent in the last quarter century. There is however a brighter side to the picture, for while the incidence has increased, the mortality, as I shall show later, has decreased.

That we may visualize the present status of this operation and something of its development the history of cesarean section is divided into five eras.

About the first era little is known except that the operation was done on the dying or dead woman. The *Lex Regia*, pronounced by Numa Pompilius who lived 760-715 B C., required the delivery from dead or dying women. According to Jewish writings, it was probably performed on the living woman before the Christian era.

The second period begins with the sixteenth century. At this time the operator took no sutures but depended upon muscular action to close the uterus and thus to prevent hemorrhage, and, as one would expect, the

Read before the Niagara County Medical Society, November 10, 1936

mortality was frightful, Kayser found a death rate of sixty-two per cent for eighty years. Harris of Philadelphia in 1871, in a statistical study of cesarean section, collected fifty-nine cases with a mortality of forty-eight per cent. Of thirty-eight women operated upon in Great Britain between 1739 and 1845 only four recovered.

The third era started in 1876 when Porro of Milan advocated the operation which today bears his name—by which operation, the uterus is removed after having been opened, the child delivered, and in Porro's original technic the uterine stump anchored in the abdominal wound. The mortality fell considerably due partly to Porro's technic and partly to the work of Lister and Pasteur in the cause of infection and antiseptics.

The fourth era dates from 1882 when Sanger introduced sutures in the uterine incision. Up to this time this procedure marked the greatest advance in the technic of the cesarean operation.

The fifth or last era marks the advent of the extra peritoneal section ushered in by Frank of Cologne in 1907. Also included in this, the present period, is the modification of Frank's operation by Latzko and Sellheim and more important still that of Kronig, the low cervical flap operation now called laparotrachelotomy.

Let us go back to the beginning of the nineteenth century when Denman³ in his "Midwifery" said, "No other principle than that of necessity can certainly be admitted as a justification for this operation, that is, whenever it is proposed there shall be no other way or method by which the life either of the mother or child can possibly be preserved and the impossibility shall be confirmed not by the opinion of one but as many competent judges as can be procured. Every woman for whom the cesarean operation can be proposed to be performed will probably die and should any one survive, her recovery might rather be considered as an escape than as a recovery to be expected though there is always a probable chance of saving the child."

Only about forty years later (1849) our own Meigs⁴ in describing a badly deformed pelvis wrote

In such a pelvis as this the pregnant woman ought to be advised to submit to an early abortion whereby she would be preserved from an ultimate direful necessity to undergo a frightful cesarean operation.

I hold that no man has a right

to subject a living breathing human creature to so great a hazard as that attending the cesarean section from views relating to any other interests than those of his patient's, I believe that cesarean operation ought not to be performed in any case whether the child be living or dead in which under the dictates of a ripe and sound judgment and perfect knowledge of the principles of midwifery, a decision may be obtained that a delivery per vias naturalis is less dangerous to the mother than that by vivisection.

From France, Gueniot reported twenty-six years later that in the history of cesarean section in Paris he found only six authentic successes in the eighteenth century and that in sixty-nine years of the nineteenth century in forty operations, no patient survived.

In 1876 Playfair's "Obstetrics"⁵ was published. From this I quote the following, "In this country (England) it has scarcely ever been performed in a manner which offers even the faintest hope of success, it has been looked upon as almost necessarily fatal to the mother and it has therefore been delayed until the patient has arrived at the utmost stage of exhaustion, two or three, even six days after labor had begun and when the patient was almost moribund." Again, speaking of operating under improved conditions (of the times), "As carefully as one did an ovariectomy, making every allowance for these facts it must be admitted that the cesarean section is necessarily almost a forlorn hope and in making these observations I have no intention of contesting the well-established rule of British practice that it is not admissible as an operation of election and must only be resorted to when delivery per vias naturalis is clearly impossible." Of seventy-seven operations in England sixty-six, or eighty-five per cent, were fatal, "The cesarean section is required when there is such defective disproportion between the child and the maternal passages that even a mutilated foetus cannot be extracted."

As recently as twenty-five years ago, it was considered the duty of the operator to sterilize the patient at the time of the first cesarean section in order to obviate the necessity for a repetition of the operation and no physician at that time would have been much criticized for the performance of an early abortion in a woman with

marked pelvic contraction in order to avoid a delivery by the abdominal route

I have reviewed these early ideas of the operation in order that we may realize what a boon this procedure has become to many women who in the past would have been destined to live out a childless existence, or, if subjected to cesarean section in those earlier years would have perished in an appallingly large percentage. It is also unfortunately true that along with the blessings of cesarean section has gone its abuse and that while many lives have been saved, many have been lost through injudicious operating. For these reasons I think it is well to discuss the subject from the standpoint of indications, contra-indications, technic, and results

Indications

Specifically the indications might be catalogued as follows:

- 1 Obstructive.
 - A. Absolute pelvic contraction
 - B. Relative contraction or disproportion
 - I. After trial labor
 - II. With other complicating factors
 - a. Elderly primiparity
 - b. General debilitating diseases
 - c. Malpresentation
 - C. Fibroids and other growths obstructing the pelvis
 - D. Anomalous obstruction—vaginal stenosis, diaphragms
- 2 Hemorrhagic states
 - A. Placenta previa
 - B. Ablatio placentae
- 3 General debilitating diseases
 - A. Decompensated heart disease
 - B. Pulmonary tuberculosis
 - C. Toxemia of pregnancy
- 4 Previous cesarean section
- 5 Extensive plastic repair of pelvic structures—cervix, perineum or fistulae
- 6 Elderly primiparity

Inasmuch as many of the conditions outlined above are only relative indications, they should be more clearly defined

Pelvic contraction Space does not permit of a discussion of the various forms of pelvic contraction and deformity, but, briefly a true conjugate of 7.5 cm. and under should call for elective cesarean section unless the

baby is unusually small (and if so is usually premature). A funnel pelvis the sum of whose bischial and posterior sagittal diameters falls below fifteen cm is also an absolute indication for elective section, but it should be remembered that trial labor is of no value in outlet pelvic contraction

The operation should also be done by election in other causes of obstruction such as fibroids and ovarian growths low in the pelvis. Relative contraction (a true conjugate above 7.5 cm.) either alone or complicated by other conditions, as elderly primiparity, malpresentation or general diseases like cardiac decompensation calls for the exercise of mature judgment gained only from experience. Generally it might be said that cesarean section should be done if indicated and if it be felt that it offers as safe a method for the mother as a pelvic delivery. This question cannot be settled on a mathematical basis like absolute pelvic obstruction, but, as I have said, the decision requires good judgment—and that is not infallible

Trial labor, properly conducted, in cases of moderate pelvic contraction today not only admits of greater thoroughness but happily in many cases proves that a pelvic delivery is possible. Just what constitutes a test of labor to prove this point cannot be easily defined, but in general it implies more of labor than we formerly characterized as a test. This is because of the use of the low cervical section or laparotrachelotomy, for we can more safely deliver by this method after full dilatation and rupture of the membranes than by the classical technic, provided no vaginal examinations have been made and the membranes have not been ruptured too long. The length of the labor is not an adequate test, but full dilatation in the presence of good uterine contractions with other signs of progress—or lack of signs, as engagement and descent of the fetal head—clears the picture. In the conduct of a test of labor in any borderline case where there is the possibility of a resort to cesarean section, no vaginal examinations should be made and a minimum of rectal explorations, for I believe many rectal examinations are not free from the danger of infection. The surroundings of the patient provide another factor to be considered. Many small hospitals have maternity departments which are not isolated from nonobstetrical patients such as septic surgical and medical cases. Because of the fact that the newer technic (laparotrachelotomy) is safer to perform on the patient in labor, a false sense of security has resulted in its use in badly handled cases

where the Porro or radical cesarean section should have been done—or even embryotomy

Fibroids The majority of labors complicated by fibroids will permit delivery through the pelvis, those arising from the lower uterine segment and cervix should demand elective cesarean section. I recall two cases of multiple small fibroids which while not obstructive, nevertheless so interfered with the contraction and retraction of the uterus that labor would not progress and abdominal delivery was necessary

Hemorrhagic States

Placenta previa and premature separation of the placenta do not in every case indicate cesarean section. Most cases of marginal placenta previa and mild separation can be quite well delivered through the pelvis. All cases of central placenta previa and those of the marginal variety in primiparae with undilated cervixes should have abdominal delivery. The so-called tragic case of ablatio or separation with tender uterus and signs of hemorrhage internal or external should have cesarean section not only to effect prompt and rapid delivery and control of the hemorrhage, but also that hysterectomy may be done in the occasional case of severe infiltration of blood into the uterine muscle or broad ligament. This is the one condition where the operation is almost always done solely in the interest of the mother and is admissible in the presence of known death of the fetus. Transfusion is not only desirable but should be routine in these two hemorrhagic conditions not only to replace blood lost before the operation, but, as Bill⁶ has shown, to render the uterus capable of contracting, thus preventing further hemorrhage postpartum.

General Debilitating Diseases

Patients with decompensated heart disease including either the hypertensive, rheumatic or other variety, particularly in a primipara, for whom bed rest and digitalization have produced only partial improvement, are best delivered by elective cesarean section under local anesthetic alone or local plus a minimum of nitrous oxide or cyclopropane inhalation anesthesia. In a multipara with a history of short easy labors the elimination of the second stage by forceps extraction will often be preferable.

Medical consultants, I find, are prone to insist on cesarean section with or without sterilization in cases of medical conditions such as cardiac and renal disease, and I feel that the obstetrician should be more than a mechanic who carries out the

method suggested by the internist. He should have some opinion of his own based upon his experience in the handling of these cases, for I fear the medical profession generally shares with the laity the opinion that cesarean section is a comparatively innocuous operation with little risk. There is a tendency in pregnancy complicated by medical conditions, as cardiac and renal disease and diabetes to urge cesarean section in order that the patient may be sterilized at the same time. Cesarean section should never be an excuse for sterilization. If abdominal delivery is indicated *per se*, both operations can be done at the same time. If sterilization alone is called for, it should be done after delivery, for the mortality rate is much lower for this operation than is that of cesarean section.

Pulmonary tuberculosis In the presence of active phthisis in a woman in her first pregnancy and in a multipara also—unless one has reason to believe she will have a short labor—it is better to obviate the strain of labor by abdominal delivery. This can usually be done under novocain local infiltration as suggested for the delivery of the cardiopath. Accurate studies of intrathoracic pressure measured on a manometer made during labor by Dr. John Lloyd⁷ have shown such a tremendous increase in pressure that he believes that most tubercular patients, even those with healed lesions, should not go through labor but that a rapidly done section under local anesthesia offers a much better prognosis. It is possible that this increase in intrathoracic pressure with consequent breaking down of adhesions and healed lesions may explain why many phthisical patients doing well during pregnancy because of increased metabolism go down hill rapidly after their delivery.

Toxemia of pregnancy Induction of labor in the eighth or ninth month is often disappointing, *first*, whether it will succeed at all, and *second* because, even though successful, the time involved is indefinite. This applies to either hydrostatic bag or bougie induction. Medical induction by castor oil and quinine with or without pituitrin or by rupture of the membranes is also uncertain. In the fulminating type of toxemia of pregnancy, time is a great element in the emptying of the uterus. These cases are well-handled by cesarean section under local anesthesia. One disadvantage in the employment of vaginal cesarean section for this condition is the necessity of using general anesthesia.

Previous Cesarean Section

"Once a cesarean always a cesarean." That

CESAREAN SECTION

Number 61

this dictum is not only unfortunate but also untrue is proven by the number of cases delivered safely every year through the pelvis. With the broadening of the indications in the last few years to include many conditions where disproportion between the size of the pelvis and head is not present, as placenta previa and pre-eclamptic toxemia, this becomes an increasingly important question. The decision to repeat a cesarean where the previous section or sections were done for extra pelvic or nonobstructive causes should be made only after a thorough study of each individual case. The first factor that should enter into the decision is the time interval since the last abdominal delivery. If this is relatively short one should favor a repetition of the operation. If the recovery from the previous operation was stormy, that is if there was fever and other evidence of infection (thus indicating imperfect healing of the uterine wound and herefore its greater liability to rupture) the patient has a better prognosis if delivered in the same manner as before. The advent of the low cervical operation has modified considerably our concepts of this moot question for the reason that the location of the scar in the lower uterine segment and cervix renders rupture during pregnancy and labor much less liable. Of the many thousands of laparotrachelotomies done in the past fifteen or twenty years, only a very few have been followed by rupture, so again we have another factor to consider in our decision, in other words, it is much safer to subject to labor a patient whose previous cesarean section was of the low technic. In any case where delivery through the pelvis is decided upon, the second stage, when the uterine scar is subjected to the greatest strain, should be obliterated or shortened by forceps delivery. Any woman with a uterine scar, subjected to labor in a subsequent pregnancy, should be in a well-equipped maternity hospital and under constant observation. The estimated frequency of rupture of cesarean scars in subsequent pregnancy or labor is four per cent. Holland^o found eighteen cases out of 448, and of this number 352 were delivered by section by election. The eighteen ruptures occurred among the ninety-six that went into labor, so the rate of rupture for those subjected to a test was 18¾ per cent. These figures apply of course to the classical operation.

Pelvic Plastic Repair Procedures

In any case where a fistula resulting from a previous pelvic delivery has been successfully repaired, this work should not be nulli-

fied by a pelvic delivery. This is true also of a well-repaired complete perineal laceration unless the baby is unusually small.

Amputation of the cervix often is an insurmountable obstacle to the dilation of its remaining fibers and necessitates cesarean.

Elderly Primiparity

I have heard it said by enthusiasts that every woman having her first baby after her thirty-fifth year should have an elective cesarean section. This of course is such an extreme view as to be absurd. In labors an extreme view as to be absurd. In labors in 307 elderly primiparae reported by me five years ago,⁸ thirty-five or 11.4 per cent had their babies by the technic under discussion, but in only 2.9 per cent of the total of 307 was elderly primiparity the sole indication and then only after a test of labor. In the remaining 8½ per cent of the total, other factors as contracted pelvis, etc., complicated the picture and would have probably demanded cesarean section if the woman had been in her early twenties. I do feel, however, that in case of lack of progress in the elderly primipara, if the choice of competing methods of delivery lies between version, difficult forceps, and cesarean section, we should lean much more toward the last method than we would if the patient were under thirty with therefore greater chances for future successful pregnancies and labors.

In many cases one indication alone is not present, but, while no one of several factors in a given case seems sufficient, the composite picture indicates that the mother or baby or both would fare better if delivered by abdominal section. This is well-illustrated by the following cases.

A primipara of forty who had been through a period of amenorrhea and sterility as the result of ill-advised treatment of a simple menorrhagia by radiation, became pregnant. She threatened to abort but, by bed rest and sedatives, she was carried to the eighth month when she went into labor which was complicated by a mild premature separation of the placenta and transverse position of the child. Here the value of this child was great because of the improbability of future pregnancies. A living child was delivered by cesarean section and is now over two years of age. No conception has followed this pregnancy.

An elective operation was done in another case of a primipara of forty suffering from toxemia. Neither the elderly primiparity nor the toxemia might have seemed to me to be sufficient justification for delivery by cesarean section but the combination of the two conditions presented a problem which it appeared could best be solved by abdominal delivery.

Contraindications

That too many cesarean sections are done today is generally admitted. It is also true that the mortality rate is unwarrentably high due to improper handling of cases in labor before subsection to operation and to the injudicious selection of cases. It is just as important to clearly emphasize when the operation should not be done as it is to outline reasons for its performance.

Do not operate on the woman upon whom attempts at delivery have been made. The mortality rate for these cases approaches thirty per cent.

Do not operate after many vaginal examinations have been done, no matter how meticulous the technic, or even after one vaginal examination made without regard to rigid asepsis.

The length of labor is a factor. We know bacteria can be found in the birth canal after dilatation of the cervix. Long labors often mean also exhaustion of the patient. The time that has elapsed after rupture of the membranes is the third factor, whether the patient has been examined or not. Eardley Holland⁹ analyzed 4197 cesarean sections in the British Isles and the following tabulation of mortality rate from his study is very significant.

	%
After elective cesarean	16
Patients operated early in labor	18
Patients operated late in labor	10
After induction of labor	14
After attempted forceps	27

In a series of 110 operations collected by Trillat,¹⁰ forty-three clean cases gave one death (uremia) (23%), fifty-three suspicious cases gave three deaths (56%), and fourteen febrile cases gave four deaths (28.5%), a total mortality of 7.2 per cent.

In thirty-two, the membranes had ruptured up to twelve hours with a mortality of 6.1 per cent, in eleven, the membranes had ruptured twelve to twenty-four hours, a mortality of 9.0 per cent, in twelve, the membranes had ruptured 24+ hours, a mortality of 33.3 per cent.

Nothing is said in Trillat's paper as to vaginal examinations. This mortality rate is inexcusably high and it seems that examinations must have been made. Nine per cent is much too high a death rate for membranes ruptured twelve to twenty-

four hours unless vaginal manipulation had occurred.

Eclampsia is, I believe, an almost absolute contraindication. The mortality for the convulsive toxemias treated by section in many series of cases has been found to be much higher than that in the conservative treatment of the disease, and no obstetrical clinic that I know of employs this method of delivery in eclampsia today. Holland's series showed a thirty-two per cent mortality in eclampsia, and in Detroit in 1925 the rate was 42.7 per cent.

Uterine inertia alone is very rarely an indication *per se*. Encouragement and rest by the use of morphine will usually solve the problem of inertia without resort to cesarean.

Technic

There is nothing involved or complicated in the performance of this operation. In fact its very simplicity reacts to its detriment because of its too frequent employment. While it is a simple operation I would like to emphasize a few points.

Morphine should not be given before operating because of the danger of fetal asphyxia. Nitrous oxide or cyclopropane combined with local one-half per cent novocain is the ideal anesthetic combination. Local infiltration with novocain can be used alone where inhalation anesthesia is contraindicated as in toxemia, pulmonary tuberculosis, and cardiac decompensation. Pituitrin should be injected into the uterus as soon as the abdomen is opened or it can be given intravenously at this time. The site of the uterine incision can be packed about with gauze to absorb the amniotic spill. The uterus is then opened in its lower half *in situ*—the fetus delivered by the feet. An assistant should be in readiness to take over the baby at this point and all provisions for treating asphyxia should be in readiness such as a cylinder of carbon-dioxide-oxygen, a tracheal catheter, and warm tub bath. The placenta should not be extracted by traction upon the cord for fear of inverting the uterus through the incision. In closing the uterine incision, the first row of chromic catgut should include about one-half the thickness of the

musculature and should not penetrate the mucosa, this row should be interrupted. The second row of continuous chromic includes the remaining musculature up to the serosa which in turn is sutured with plain number 1 catgut. I have never packed the uterus or left the placenta to be expelled through the cervix.

Laparotrachelotomy or low cervical cesarean section by the single or double peritoneal flap method marks the fifth historical period in the development of this operation. The abdomen is opened by a midline incision from the umbilicus to the symphysis. Catheterization of the bladder should have been done just before the operation—one may or may not pack with gauze around the site of the incision. The first step is a transverse incision through the peritoneum of the lower uterine segment about three-quarters of one inch above the bladder reflection. This is easily done by scissors opened in the line of cleavage to separate the peritoneum from the uterus and then cut across this line. The upper flap is carefully stripped back from the uterine wall for an inch or an inch and a half upward. In similar manner with the bladder held near the symphysis by a suprapubic retractor, the lower flap is separated well down behind the bladder to the cervix so that there is exposed by the two flaps a space on the lower uterine segment of about five inches. Either ergotrate or pituitrin should now be given intravenously. The uterus is opened with a knife at the upper end of the exposed space and is enlarged to its full length by bandage scissors taking care to protect the bladder. I have not employed the transverse uterine incision because of its proximity to the vascular areas of the broad ligaments because of danger of troublesome bleeding from extension of the incision on removing the baby. There is, I believe, greater danger of pulmonary embolism for the same reason.

Delivery of the child is effected by shelling out the head in vertex presentation using one hand as a vectis and employing pressure upon the fundus with the other. After delivery of the placenta, suturing of the uterine incision is begun at the lower angle with number one chromic continuous suture. The effort is made to avoid inclusion of the endomet-

rium in the suture but because of the thinness of the lower uterine segment this is often impossible. A second more superficial layer of interrupted sutures is placed in the musculature. It is important that one of these two layers of sutures should be interrupted. Suturing is begun at the lower angle because the bleeding is more profuse here. After closure of the uterine incision the upper peritoneal flap is brought down and tacked down to the uterine wall with a fine running suture, the lower flap is brought to overlap the upper and tacked down. In doing this, it is important to avoid inclusion of the bladder in the suture for several vesicouterine or vesicocervical fistulae have been reported from injury to the bladder wall. The closure of the abdominal wall is done in the usual manner. The after care of all cesarean cases is important and can be briefly summarized as follows:

- 1 1,500 c.c. of saline or five per cent glucose is given subcutaneously in the anterior thighs.

- 2 Morphine is given in sufficient quantity to keep the patient free from pain.

- 3 Only sips of hot water are allowed by mouth for the first twenty-four hours, acute gastric dilatation is a not infrequent complication of a cesarean puerperium and is a dangerous and unpleasant event.

- 4 In the low cervical cases if the patient has not voided by eight hours she should be catheterized because of the suture line in the lower or bladder peritoneal flap.

- 5 Clear tea and ginger ale are permitted on the second day.

- 6 The patient should be put in the semi-Fowler position after twenty-four hours to favor uterine drainage.

- 7 For abdominal distension, flaxseed poultices and the rectal tube. An enema is not given until after peristalsis has started and the patient is passing flatus. This is sometimes not until the third or fourth day.

- 8 Patients are allowed out of bed on the tenth day.

The employment of the low cervical technic or laparotrachelotomy for the past fifteen years or more has proven its superiority over the classical technic especially in the cases in labor. I wish to quote from a paper I wrote seven years ago entitled "A Study of 165 Consecutive Cesarean Sections."

- 1 Sutures placed in the lower uterine segment are not subjected to as much stress

Contraindications

That too many cesarean sections are done today is generally admitted. It is also true that the mortality rate is unwarrantedly high due to improper handling of cases in labor before subsection to operation and to the injudicious selection of cases. It is just as important to clearly emphasize when the operation should not be done as it is to outline reasons for its performance.

Do not operate on the woman upon whom attempts at delivery have been made. The mortality rate for these cases approaches thirty per cent.

Do not operate after many vaginal examinations have been done, no matter how meticulous the technic, or even after one vaginal examination made without regard to rigid asepsis.

The length of labor is a factor. We know bacteria can be found in the birth canal after dilatation of the cervix. Long labors often mean also exhaustion of the patient. The time that has elapsed after rupture of the membranes is the third factor, whether the patient has been examined or not. Eardley Holland⁶ analyzed 4197 cesarean sections in the British Isles and the following tabulation of mortality rate from his study is very significant.

	%
After elective cesarean	1.6
Patients operated early in labor	1.8
Patients operated late in labor	10.0
After induction of labor	14.0
After attempted forceps	27.0

In a series of 110 operations collected by Trillat,¹⁰ forty-three clean cases gave one death (uremia) (2.3%), fifty-three suspicious cases gave three deaths (5.6%), and fourteen febrile cases gave four deaths (28.5%), a total mortality of 7.2 per cent.

In thirty-two, the membranes had ruptured up to twelve hours with a mortality of 6.1 per cent, in eleven, the membranes had ruptured twelve to twenty-four hours, a mortality of 9.0 per cent, in twelve, the membranes had ruptured 24+ hours, a mortality of 33.3 per cent.

Nothing is said in Trillat's paper as to vaginal examinations. This mortality rate is inexcusably high and it seems that examinations must have been made. Nine per cent is much too high a death rate for membranes ruptured twelve to twenty-

four hours unless vaginal manipulation had occurred.

Eclampsia is, I believe, an almost absolute contraindication. The mortality for the convulsive toxemias treated by section in many series of cases has been found to be much higher than that in the conservative treatment of the disease, and no obstetrical clinic that I know of employs this method of delivery in eclampsia today. Holland's series showed a thirty-two per cent mortality in eclampsia, and in Detroit in 1925 the rate was 42.7 per cent.

Uterine inertia alone is very rarely an indication *per se*. Encouragement and rest by the use of morphine will usually solve the problem of inertia without resort to cesarean.

Technic

There is nothing involved or complicated in the performance of this operation. In fact its very simplicity reacts to its detriment because of its too frequent employment. While it is a simple operation I would like to emphasize a few points.

Morphine should not be given before operating because of the danger of fetal asphyxia. Nitrous oxide or cyclopropane combined with local one-half per cent novocain is the ideal anesthetic combination. Local infiltration with novocain can be used alone where inhalation anesthesia is contraindicated as in toxemia, pulmonary tuberculosis, and cardiac decompensation. Pituitrin should be injected into the uterus as soon as the abdomen is opened or it can be given intravenously at this time. The site of the uterine incision can be packed about with gauze to absorb the amniotic spill. The uterus is then opened in its lower half *in situ*—the fetus delivered by the feet. An assistant should be in readiness to take over the baby at this point and all provisions for treating asphyxia should be in readiness such as a cylinder of carbon-dioxide-oxygen, a tracheal catheter, and warm tub bath. The placenta should not be extracted by traction upon the cord for fear of inverting the uterus through the incision. In closing the uterine incision, the first row of chromic catgut should include about one-half the thickness of the

7 There is much less chance for peritonitis postoperative, the most frequent cause of death following classical cesarean section

8. With this type of operation in reserve a real test of labor may be employed in borderline pelvic contraction and it will be found that a large percentage can be delivered per vaginam

9 It can be used in referred cases seen later in labor, unless they have been grossly mismanaged.

10 The mortality is lower, a series of 620 operations with only 6 deaths (three of which were nonoperative deaths) in one clinic, a percentage of less than 1 as against 4 to 5 per cent in unselected series of classical sections

11 The comfort of the patient in comparative freedom from vomiting, distension and pain, these patients present as little evidence of shock or exhaustion as one following a clean appendectomy and much less than the case subjected to a difficult instrumental delivery through the pelvis

There is no difficulty in repeating the operation, several patients have had 3 laparotomies and on one woman I have done 6 of these low cervical cesarean sections, repeating the original two flap technic 5 times without difficulty

Mortality of Cesarean Section

The mortality of cesarean section varies from zero in a few series of one to two hundred cases each, to fourteen per cent. The death rate for City surveys is higher than that of clinics of well-organized Lying-In hospitals and is lowest in several series conducted by one obstetrician. Fortunately the percentage of death is falling. This is due to the adoption of a more conservative attitude in the choice of cases for operation, that is in not operating on the badly handled case which is potentially infected. Also it is due to the more widespread employment of the low cervical technic. Tables I-II show the average risk in two large series, first of the older or classical section and second of laparotomies

The number of operations in both series is sufficient from which to deduce accurate estimates. They are from diversified sources, clinics, city wide surveys, and individual operators. It is quite evident that, with a mortality rate of only one third of that of the older technic, low cervical section carries much less risk to the

patient. For this reason, it should be more generally adopted for, if it is superior in the cases of trial labor it should also be superior for the elective case.

Opinions as to the general mortality of cesarean vary. Stander³⁰ estimates the general rate throughout the United States to be ten per cent. The White House Conference questionnaire to 138 hospitals showed 2,273 cases operated with 134 deaths (5.9%). Stander says that if done at the appropriate time in properly selected cases in good surroundings by a well-trained operator, the mortality rate of cesarean section should be no more than one-third of one per cent. This I feel is too optimistic a view. One of the commonest causes of death following cesarean is pulmonary embolism which is particularly common after this operation. The incidence of pulmonary embolism in pregnancy in general is 0.1 per cent, but in pregnancy complicated by cesarean it is 1.5 per cent. Postpartum hemorrhage may complicate delivery by the abdominal route as it does pelvic births. Neither of these conditions can often be foreseen and usually they are not amenable to treatment. It is because of such unpreventable fatal complications that we should hesitate before a decision is made. What should be the death rate for this operation?

I agree with Stander that, given the ideal conditions outlined by him, the rate should not exceed one third of one per cent. Operating under the strictures laid down by Stander, however, means that we would be doing it only as a procedure of election. Schumann³¹ has made a plea for the elective operation. It is quite true that if cesarean section were done only before labor or at its onset the mortality rate would be lower. This implies more exact estimation of the relative proportion of the size of the head and pelvis than is possible except by trial labor which properly handled I believe is justifiable.

To return to Standers estimate of a death rate of one-third of one per cent under the ideal conditions outlined by him. This would not permit of the use of cesarean in placenta previa and ablatio placentae or severe cardiac disease. This rate of 3 per cent corresponds closely to that of the series reported in this paper (264 operations with one death) where

from contraction and relaxation of the uterine musculature making for a stronger scar. Four patients in this series have been operated upon twice and one thrice by the low cervical technic, in all of these the scar in the uterus could not be identified.

2 A lessened liability to uterine rupture in subsequent pregnancies and labors. There have been only ten ruptures in the 3,600 reported operations, 0.28 per cent as against 2.5 to 4 per cent for the classical operation.

3 Because of this the dictum "Once a

cesarean always a cesarean" is not as valid today as it was a few years ago. It is safer in other words to permit of a trial labor in cases where the indication for the original low cervical section was extrapelvic than were the original operation the classical.

4 Cervix is more tolerant of infection.

5 The lower abdomen stands infection better than the upper.

6 In case infection does occur outside the uterus, it is in a location most favorable for its localization and evacuation.

of 1004 on each of two succeeding days following delivery not including the day of operation. There are many conditions which might seriously threaten the well-being or even the life of the patient which would not fall under this criterion. Hemorrhage late, pulmonary embolus, and ventral hernia, are examples. Morbidity should be measured by the complications whether febrile or afebrile which temporarily or permanently affect the patient to the detriment of her health and physical condition. When we honestly review any series of these operations, while we may superficially consider the procedure a comparatively harmless one if our mortality rate is low, nevertheless we will find that many of these patients were in real danger and it is this thorough evaluation of the operation which should guide us in our decision whether to operate or not.

Complications to be considered are, of course, sepsis, peritonitis, infection of the abdominal incision, pulmonary embolus, and thrombophlebitis pelvic or crural.

Complications encountered in the series of ninety-four ward and 264 private cesarean operations in the General Hospital series

Pulmonary embolus fatal	1
Pulmonary embolus non fatal	2
Phlebitis (phlegmasia alba dolens)	6
Infection of abdominal incision	11
Ileus	3
Intestinal obstruction, operation	1
Perforation of adherent bowel at subsequent section	1
Opening of abdominal incision necessitating operation	1
Ventral hernia	1
Vesicocervical fistula spontaneous closure	1

Possible sequelae are weak uterine scar with its tendency to rupture, adherent

bowel with danger of injury at subsequent section.

Sterility has been given as a frequent sequel to cesarean section—I do not believe however that infertility often follows the operation as a result of it but that the sterility is voluntary on the part of the patient, possibly because of her reluctance to undergo a repetition of the operation. I cannot understand how an incision in the uterus could produce sterility. The sequelae are relatively uncommon. The patient who has had her child or children by cesarean section is usually none the worse for it and has escaped damage to the cervix and pelvic floor with which so many patients who have had difficult deliveries through the pelvic canal have to contend.

Conclusions

1 Cesarean section occupies a well-deserved place in the obstetric procedures of today.

2 The indications for its performance have increased tremendously in the past twenty-five years.

3 The mortality rate throughout the United States is probably between seven and ten per cent, whereas it should not be above one and one-half to two per cent.

4 The high death rate is due not so much to errors in operative technic as to poor judgment used in selecting cases for operation, because (a) its indications and contraindications should be more positively defined (b) Laparotrachelotomy has a wider application and a lower mortality rate than the older or classical technic, therefore laparotrachelotomy or the low cervical section should be more generally employed.

the indications were many 100 had had trial labors or were in labor but I believe this rate will never again be equaled at this hospital, and that a rate less than one per cent for the operation done in large numbers is an ideal that is hardly possible of improvement

The commonest cause of death following cesarean section is infection usually in the form of peritonitis This can be prevented by proper handling in labor eliminating vaginal examination and in refusing to operate on a patient whose membranes have been ruptured a long time (over 24 hours for instance), second and of equal importance, any case in labor should be operated by the low flap cervical technic If there is reason to believe infection is already present as shown by the methods used in handling the case or

collapse as the result of a pulmonary embolus This one death in 264 gives a mortality rate of 0.3 per cent

Morbidity In estimating the morbidity (a temperature of 100.4 per cent on two successive days postoperative not including the day of operation) I have purposely separated the low cervical from the classical group (Table III)

Significant facts in this table are that while the morbidity rate is practically the same in the low cervical and classical, sixty-one per cent of the low cervical had had trial labor (after which morbidity is to be expected) as against nineteen per cent of trial labor in the classical Put another way, eighty per cent of the classical sections were done before the onset of labor and should theoretically have shown a much lower morbidity rate than

TABLE III

	<i>Trial Labor</i>	<i>Elective</i>	<i>Morbidity</i>
Classical	29 (19.4% of total of classical)	120 (80.5%)	48 (32.2%)
Low Cervical	71 (61.7% of total of low cervical)	44 (38.2%)	39 (34.0%)
	100	164	

by the presence of fever, cesarean should not be done, but delivery through the pelvis should be the choice even at the cost of an unpleasant embryotomy The other alternative is the Porro operation, cesarean section, and hysterectomy The low cervical cesarean is not for the badly handled or infected case

While the 12,000 collected cases in the above table show a mortality of less than five per cent, I believe the mortality in the country at large is higher than this, for the collected series includes reported cases only and except for the included city surveys represents the work of expert operators and specialized clinics

From January 1, 1926 to August 1, 1936 there were performed in the private patient department of the Rochester General Hospital, 264 cesarean sections, 259 or ninety-seven per cent of which were done by members of the attending obstetric staff One patient died suddenly on the thirteenth day having had a normal afebrile puerperium She was sitting out of bed and had been discharged to go home the next day, when she went into

the laparotrachelotomies of which only thirty-eight were elective operations I attribute this rather enviable record as to maternal mortality to the following

1 The use of the low cervical cesarean section in seventy-one per cent of the cases subjected to trial labor

2 Vaginal examinations had been done in only twenty-nine of 253 cases where there was available data

3 No operation was preceded by forceps application or other attempts at delivery except in one case which had been bagged for placenta previa

4 The large number of classical sections done as elective or before the onset of labor

5 Anesthesia was given by an expert—a physician, of course, and gas oxygen—local combination in practically all cases except a few done under local alone

6 Proper selection of cases

7 Membranes were ruptured in only forty-nine of 261 with available data

Of almost equal importance with mortality should morbidity be considered The yard stick at present is that arbitrary one set up by the American Committee on Maternal Welfare, viz—a temperature

of 1004 on each of two succeeding days following delivery not including the day of operation. There are many conditions which might seriously threaten the well-being or even the life of the patient which would not fall under this criterion. Hemorrhage late, pulmonary embolus, and ventral hernia, are examples. Morbidity should be measured by the complications whether febrile or afebrile which temporarily or permanently affect the patient to the detriment of her health and physical condition. When we honestly review any series of these operations, while we may superficially consider the procedure a comparatively harmless one if our mortality rate is low, nevertheless we will find that many of these patients were in real danger and it is this thorough evaluation of the operation which should guide us in our decision whether to operate or not.

PHILADELPHIA POSTGRADUATE INSTITUTE

"Diseases of the Chest and Upper Respiratory Tract" will be discussed at the Second Annual Session of the Postgraduate Institute of The Philadelphia County Medical Society

The subject to be considered is of great interest to general practitioners and its various ramifications will be ably discussed by fifty Philadelphia physicians, each one a qualified teacher, who will speak with authority. A scientific exhibit and clinical demonstrations will add to the value of the program. This year, the Postgraduate Institute undoubtedly will contribute the outstanding sectional scientific medical meeting in the East.

Members of all County Medical Societies are cordially invited to register as Annual Members of the Institute and to attend its scientific sessions. A Philadelphia welcome awaits them.

Further information will be furnished by the Secretary of your Society or upon application to the Executive Office of The Philadelphia County Medical Society, 21st and Spruce Street, Philadelphia, Penn.

The JOURNAL has been informed of the following details

1 Registrants shall be members of a county medical society and must present credentials

2 Subject, "Diseases of the Chest and Upper Respiratory Tract," to be discussed by fifty teachers

3 Date of Meeting, April 12 to 16, 1937

4 Place of Meeting, Bellevue-Stratford Hotel, Philadelphia, Penn.

5 Registration Fee, \$5 00

6 Hotel accommodations at reasonable rates may be obtained by writing to Frederick S. Baldi, M.D., Chairman on Hotels, S E. Corner 21st and Spruce Streets, Philadelphia, Penn.

7 A scientific exhibit as well as technical exhibits will be displayed

WOMEN'S MEDICAL SOCIETY OF NEW YORK STATE

The Council Meeting of the Women's Medical Society of New York State was held in New York City, January 16 and 17. The business of the Society was transacted and plans were made for the Annual meeting to be held in Rochester in May preceding the regular state meeting.

Officers for the ensuing year were nominated as follows: President Dr Anna Walsh—Buffalo, Vice-Presidents Dr Kathleen Buck—Rochester, Dr Annie Daniel—New York City, Dr Alice S. Wooley—Poughkeepsie, Treasurer Dr Alta S. Green—Williamsville, Secretary Dr Marguerite P. McCarthy—Solvay, Chairman of the

Scientific Program Dr Margaret Warwick—Buffalo, Chairman of Publicity—Dr Madge C. L. McGuinness—New York. Dr Louise Hurrel of Rochester was appointed Chairman of Arrangements for the May Meeting.

Dr Isabelle Knowlton of New York Infirmary addressed the Society on "Radiation in Carcinoma of the Cervix." Dr Harriet McIntosh, New York, read a paper on "X-radiation in Bone Metastasis."

Guests of honor at the Dinner held at the Cosmopolitan Club were Dr Maude Abbot of the McGill Faculty of Medicine and Dr Mabel Aiken of Oregon.

A colored mammy walked in and asked for one of those little known southern preparations—an ointment. When asked what she wanted it for she said it was used for

the "seven year itch," and said she, "Doc, it's wonderful, I've been using it fourteen years"

AURAL VERTIGO

E MILES ATKINSON, MD, FRCS, *New York City*

Assistant Surgeon, Manhattan Eye, Ear and Throat Hospital, Late Hunterian Professor, Royal College of Surgeons of England

It is common knowledge that some lesion of the labyrinth or vestibular tract is the most usual cause of vertigo—Sir William Gowers put it as high as ninety per cent of all cases—but the fact must not be forgotten that many other lesions of the central nervous system may also cause this symptom. The maintenance of equilibrium depends upon the integrity of a complicated reflex arc, involving not only the ear and vestibular tract, but the eye, muscles, joints, and their connecting tracts in the brain and spinal cord. Interference, therefore, with any one or more of these may result in difficulty in the maintenance of equilibrium and consequently produce the sensation of dizziness. Thus, before treating a case of vertigo as one of aural origin it is essential to rule out other possible causes.

Causes Other Than Aural

1 *Abnormalities of end-organs* Visual vertigo, the result of muscular imbalance or fatigue, is quite common but is often overlooked, and immediate relief comes from the prescribing of suitable spectacles.

Vertigo of the neck reflexes probably seldom, if ever, occurs as a single entity, but some interference with this reflex mechanism, by fibrositis or arthritis, accompanies more cases than is realized, and the ignoring of this possibility can be a cause of failure for the doctor and of kudos for the chiropractor. I have recently seen such a patient who, after five months vain doctoring, was relieved of his vertigo, though not of his accompanying deafness, by manipulation, to the lasting discredit, in his eyes, of the medical profession.

2 *Central nervous system*

(a) Tabes, multiple sclerosis, Friedreich's ataxia, cause dizziness from interference with nerve tracts other than the vestibular. It is very easy to miss such cases, particu-

larly in their early stages and if accompanied by some degree of deafness, as they well may be. Every case of vertigo must have a neurological overhaul before treatment is started.

(b) Increased intracranial pressure may produce a "choked" labyrinth, on the same principle as the choked disk. The lesion is commonly in the posterior fossa.

(c) Tumors of cerebellum, of midbrain if they involve the supranuclear tract.

(d) Epilepsy, particularly the minor variety, is often associated with vertigo and is a not uncommon source of diagnostic error.

3 *Toxic* Certain poisons, either drugs or bacterial toxins, may produce vertigo. Malaria, as also the quinine used to cure it, typhoid fever, syphilis, either hereditary or acquired (of which more later)—all have vertigo as part of their symptomatology, while of drugs, quinine, as stated above, arsenic, and alcohol are well-known as having a selective action on the eighth nerve. Tobacco, though always put in this list as a cause of vertigo, affects much more the auditory than the vestibular division.

Encephalitis lethargica often causes vestibular symptoms—the site of attack probably is the region of the nuclei. Cerebrospinal meningitis may involve the labyrinth by invasion from within.

Accessory sinus suppuration is certainly a cause of vertigo, but this is probably the result more of the postnasal catarrh and the Eustachian obstruction it produces than of the direct absorption of toxins.

Dental infections may also be the source of the circulating toxin, and the removal of infected teeth has produced dramatic results. This is not to be interpreted as advocating indiscriminate pulling. For this as for other conditions I fear that many a good tooth has gone undeservedly.

4 *Vascular hyper- or hypo-tension* are both associated with vertigo. The actual *modus operandi* will be discussed later under Meniere's syndrome.

Aural Causes

Having ruled out these other possible causes, we are entitled to assume that the case is one of aural origin, and to investigate and deal with it as such. From now on in this paper, therefore, any reference to vertigo implies that it is of aural origin unless explicitly stated otherwise.

The sensation of dizziness is produced by a lack of balance between the two labyrinths. In the normal person, one labyrinth exactly balances the other, and posture is maintained by means of conditioned reflexes acting below the level of consciousness. Not until something goes wrong with the mechanism are we aware of maintaining posture. But as soon as something does go wrong—and that something may be such as to *depress* the function of one labyrinth as well as to *irritate* it—then we become conscious of balancing, we find a difficulty in doing so—we are, in a word, dizzy. The more considerable the discrepancy in function between the two labyrinths, the more severe the dizziness. In extreme cases there will be interference with the whole of the reflex mechanism and the vertigo will be accompanied by other manifestations—falling, pointing errors, nystagmus, gastrointestinal symptoms. As function returns to normal or compensation occurs, so the symptoms will subside. If, however, the threshold of stimulation of one labyrinth is permanently raised or lowered, then recurring attacks of vertigo will be liable to occur.

From the clinical standpoint we recognize the two large groups of aural cases—(1) cases due to middle-ear suppuration and (2) cases without suppuration.

Cases due to Middle ear Suppuration

Before rupture of the membrana tympani
It is not at all unusual to receive a complaint of dizziness before rupture of the membrane, and this dizziness may be quite severe. It is caused by the tension of the fluid in the middle ear which forces the stapes inwards and produces an unilateral increase of intralabyrinthine pressure. The dizziness usually disappears rapidly when the tension is relieved by rupture or incision of the drum. When it does not, the case passes into the next division.

After rupture of the membrane Vertigo

which arises or persists after drainage of the ear has been established, whether through the drum or by means of a mastoid operation (and this applies both to cases of acute and chronic suppuration) is a sign of much graver import and one on no account to be neglected. It tells of the invasion, threatened or accomplished, of the labyrinth by the infecting process, a labyrinthitis.

This is not the occasion to go into the difficult question of the varieties of labyrinthitis and their appropriate treatment. The one point of importance to appreciate is that infection of the labyrinth is extremely dangerous, and is so not because of any possible loss of function of the labyrinth itself, which is a minor matter, but because of the threat to the meninges. *Any case of labyrinthitis is potentially a case of meningitis.* The assessment of the extent of the infection, of the danger to the meninges, of the relative risk to the patient of operating or not operating on the labyrinth, are not matters which come within the scope of this paper. They require much judgment and experience, and even the experts are divided. Thus some are for early operation, others for late, some are radical, others are conservative, though in truth, as Alexander says, there is neither early nor late operation, only operation at the right time. To recognize that time is the function of experience. All of which is intended only to stress the point that cases of labyrinthitis are very difficult to handle, and that therefore any threatened case should at once be put under conditions where an experienced opinion is available and where, if necessary, a delicate and dangerous operation can be performed at any moment.

Before leaving the subject of labyrinthitis, I should like to stress the deceptive character of its symptoms. While invasion of the labyrinth may, and sometimes does, occur slowly and insidiously and without producing symptoms, it more often occurs rapidly and manifestly and shows itself by the classical signs of dizziness, vomiting, nystagmus, pointing errors. The two first are those that strike the patient and are recounted to the doctor, who may be led into the trap of diagnosing a bilious attack or gastric influenza. *A bilious attack, in a patient with past or present ear discharge, should be considered as an invasion of the labyrinth until the contrary has been proven.* A very simple examination will decide the matter—observation of the presence or absence of nystagmus, and its direction will indicate the urgency of the danger. The direction of a nystagmus is always described as that of its quick component. If the direction of the nystagmus is towards the diseased

ear, it indicates an irritation only of the affected labyrinth, if it is away from the diseased ear, it indicates the much more serious condition of paralysis from invasion by the infecting process. *A change of direction of nystagmus in the presence of suppuration is a sign of urgent danger.* Many a disaster has occurred from failure to appreciate this—it has needed the signs of an established meningitis to bring home the true state of affairs, by which time the prognosis has become well-nigh hopeless.

"Chink" vertigo. This is an apt term applied to certain cases which, as the result of a suppurative process in the middle ear, have been left with a large perforation in the membrane or have had a radical mastoid operation performed—in either event, who become dizzy if they dive into cold water or are out in a cold wind. The explanation is that they have unduly sensitive inner tympanic walls and that the impact of the cold air or water produces a cold caloric reaction. To bathers it can be a very real danger. The trouble can be prevented very simply by a piece of cotton smeared with vaseline and placed in the meatus.

Bárány's syndrome. There is a small but important group of cases to which Bárány called attention some years ago. They are characterized by intense vertigo, auditory disturbances, and severe headache, and have usually followed a suppurative process, possibly after an interval of years. A number of cases have now been described (Bárány¹ Jenkins²). The condition seems to be due to a collection of fluid in the posterior fossa, possibly to dilation of the saccus endolymphaticus (Fraser, Tweedie³), and can be cured by opening and draining the cyst. I have only had two such cases in my own practice, and in neither was I able to convince myself that the duct entered the cyst. Certainly both were relieved very rapidly after drainage. The operation is difficult because adequate exposure is not easy to obtain.

Cases without Suppuration

This heading immediately suggests Meniere's disease, that unfortunate omnibus term used to designate a large group of cases of doubtful pathology but similar symptomatology. But in addition to these, there are cases of aural vertigo without suppuration of whose causation we are certain, and it will be simpler to deal with them first and be rid of them.

Otosclerosis. The victims of this condition are liable to labyrinth storms, usually of minor degree and often described by them-

selves as bilious attacks. They are presumably the result of a temporary variation in the blood supply to one labyrinth. Occasionally these attacks are more severe, and then may be caused by an Eustachian obstruction superimposed on otosclerosis. It is well to keep this possibility in mind, as also that the obstruction may be on the sound or less affected side, for in such cases considerable relief can be given. In those due simply and solely to the otosclerotic process there is nothing to be done.

Hyperpnea. The dizziness which occurs in association with a raised blood pressure will be considered when dealing with Meniere attacks.

Syphilis. It is in acquired syphilis that vertigo is especially liable to occur, and in the secondary stage. The infection attacks the nerve, both portions of which are usually involved, and the course of the infection may be acute or chronic. In acute cases the onset is dramatic in its suddenness, the vertigo severe and prostrating, and it may be continuous for days or even weeks. I well remember the first case I ever saw. It was at a dance, and suddenly a young man went reeling about the floor and collapsed. He was, of course, presumed to have been worshipping at the shrine of Bacchus, whereas in fact Venus was the cause of his downfall. He was found to be stone deaf and quite unable to stand. It was three weeks after that before he was stable enough to leave the house. His hearing never recovered despite energetic treatment. He had a fading secondary rash at the time of his attack.

In chronic cases onset and course are similar but less severe and protracted, and the results of treatment are better, so that fair hearing is often preserved. In both varieties a dissociation of labyrinth reactions is characteristic, normal rotation reactions being found with absent caloric.

In congenital syphilis, vertigo is not usual. The auditory division is that usually affected, wherefore deaf-mutism is common.

Eighth nerve tumor. Although the cochlear branch seems to be more affected by the presence of a tumor than the vestibular, and consequently abnormalities of hearing rather than of balance to be the rule, yet occasionally the latter predominate, and therefore the possibility of this or an angle tumor has to be borne in mind in cases of vertigo. One of the earliest and most useful signs of the presence of a tumor, apart from eighth nerve manifestations, is loss of the homolateral corneal reflex from pressure on the trigeminal nerve. An absent corneal reflex demands the most thorough neurological investigation.

Paroxysmal Aural Vertigo, Ménière's Syndrome

It was in 1861 that Ménière described ten cases showing the symptom complex of recurring attacks of vertigo of variable severity, accompanied by progressive deafness and usually associated with tinnitus. Most unfortunately one patient died and was the subject of a postmortem examination at which a hemorrhage into the labyrinth was found, and to this cause the condition was for many years attributed. It got into the text-books and was handed on from one generation to another. Now whatever may be the true cause of Meniere attacks, it certainly is not hemorrhage. Hemorrhage destroys the labyrinth once and for all, while the outstanding feature of these attacks is their recurrence. But, though we know that hemorrhage is *not* the cause, we are frequently hard put to it to say what is. One thing is certain, that no single factor is responsible. The results of treatment are evidence enough of that, for where Eustachian inflation will cure one case, it will leave another unaffected. It is important to realize that Ménière's disease is not a disease but a syndrome, to get the idea firmly fixed and not merely to pay lip-service to the concept. One is so apt to attach the label and embark upon some stereotyped line of treatment, fondly pretending to oneself that one has made a diagnosis, instead of making a serious effort to discover the fundamental cause of the labyrinth imbalance. Granted that this is as yet often beyond one, failure to make the effort may lead to unfortunate mistakes. I have known the most persistent attempt made to cure an angle tumor by Eustachian inflation, and misguided efforts to lower blood pressure are a commonplace.

Pathology

It has already been said that we are very ignorant of the causation of these labyrinth storms, and many of our conceptions are in the realm of pure conjecture, but we have certain clinical and experimental facts to work on. It is obviously possible for a storm to be initiated by a stimulus applied either peripherally directly to the end-organ—

the labyrinth, or more centrally to the nerve, the ganglion or the central nucleus.

1 Peripheral stimulus As far as our present knowledge goes, we believe that the normal stimulus to labyrinth activity comes by way of the endolymph, by its movement in the semicircular canals, and by its cushioning effect on the otolith apparatus. We presume, therefore, that any abnormal stimulus will take the form of some alteration of the fluid content either in volume, consistency, or the pressure to which it is subjected. This alteration may be effected from without or from within.

(a) *From without the labyrinth* An unilateral Eustachian obstruction is far and away the commonest cause of Ménière attacks. Indeed, Scott⁴ says that seventy per cent of patients suffering from this condition have some degree of Eustachian obstruction, though whether this cause alone is operative in so large a proportion is perhaps doubtful. The mechanism is presumably a change of pressure in the middle ear altering the position of the stapes. A plug of wax pressing on the drumhead will sometimes do the same thing. In both cases, the action is on the outer wall of the labyrinth. An increase of intracranial pressure may act similarly on the inner wall, interfering with the escape of the labyrinth fluids, and so producing "choking" and the same train of symptoms.

(b) *From within the labyrinth* Factors operating from within must be of such a nature as to produce alterations in the volume of the blood or labyrinthine fluids. This is a difficult and much debated aspect of the question, and one can do no more than touch upon it here.

Alterations in blood volume must be produced by changes in caliber of the vessels. That this may be a factor of importance is suggested by the fact that quite a number of patients suffering from Meniere attacks show also evidences of vasomotor instability such as Raynaud's disease, vasomotor rhinitis, chilblains.

Hyperpiesia Patients with a high blood pressure are prone to suffer from vertigo. It is generally assumed that these attacks are due to the raised pressure, and consequently every effort is made to reduce it. In fact, their vertigo is due to the pressure being, for the time, not high enough for their needs—the reason why a hot bath will often induce an attack. Efforts to

reduce pressure in the hope of improving the vertigo do more harm than good and may be "disastrously effective" The answer in this case is a course of digitalis and ergot

Alterations in volume of the labyrinthine fluids have been investigated by Mygind and Dederding,⁵ who have produced a mass of evidence which, they claim, goes to show that, as a result of a disturbance in water metabolism, there arises an intracellular edema of the labyrinth This is held to account not only for the eighth nerve phenomena in the attacks, but for some of the associated manifestations such as the headaches, rheumatism, and cramps of which these patients often complain Recently this work has been criticised by Furstenberg,⁶ who believes that the explanation of Mygind and Dederding's results lies rather in an avidity of the cells of the labyrinth for sodium than in an intracellular edema He consequently advocates a special sodium-free diet and the administration of large doses of ammonium chloride

This work is very new and still unconfirmed, and has not as yet gained general acceptance One finds it rather difficult to understand why such a general disturbance as Mygind and Dederding's work supposes should have such purely local effects If the finding is correct, it must have a much wider bearing than simply on the question of vertigo Furstenberg has not offered any suggestion why the cells of the labyrinth in particular should display this marked taste for sodium, or in what manner it is so upsetting to them For the present, the wise man will keep an open mind, treating these suggestions as interesting hypotheses rather than proven facts until such time as some more work has been done on them

2 Central Stimulus Otologists have concentrated their attention so intently upon the peripheral stimulus and upon labyrinthine physiology and pathology that they have been rather blind to the possible importance of a central stimulus On this hypothesis those examples of Menière attacks which cannot be explained on the basis of some peripheral stimulus may be considered as owing their origin to an irritation of ganglion

or nucleus, a condition analogous to trigeminal neuralgia, to which indeed they bear a close resemblance Each condition is characterized by the suddenness of the onset with complete freedom between attacks, each may be occasioned by some peripheral stimulus, removal of which causes relief, while in each at other times no cause for the explosion may be discoverable To compare Meniere attacks with trigeminal neuralgia, to suggest that eighth nerve neuralgia might suitably describe them, is admittedly not to come any nearer to a pathological basis for their causation But it does help to produce a line of thought on treatment and to make one wonder if nerve section, which has been practiced with such success in the case of the fifth, has been given the consideration it merits in the case of the eighth

Classification

On the lines of what has been said above, a simple and suitable classification seems to be the following

I Attacks caused by a peripheral stimulus

- (a) Local factor from without (Eustachian obstruction, increased intracranial pressure)
- (b) General factor from within (changes in blood volume, changes in fluid volume)

II Attacks caused by a central stimulus

Nature of stimulus unknown (*cf* trigeminal neuralgia)

Clinical

Patients are seldom seen actually in the course of an attack, so that one is usually forced to rely upon the history and upon what can be found in the way of physical signs between attacks

The history is straightforward more often than not, of a sudden attack of dizziness which has been repeated a certain number of times, and the usual accompaniments of staggering to some support, nausea or vomiting and more or less rapid recovery But occasionally a sufferer from Menière's disease will complain of bilious attacks and this complaint from a person with diminished hearing should always arouse suspicion of a labyrinth storm Unfortunately the hearing is not always very markedly impaired and the patient omits to mention it, while the doctor does not think of asking, so that

the description of attacks of nausea and vomiting, accompanied often by diarrhea, may be very misleading. It has even misled to the extent of a laparotomy. Apart from this, it is well to inquire as to direction of rotation of objects and of falling. It is seldom that a patient can be precise about this point, but definite information if obtainable, may help to lateralize the active labyrinth.

Examination. Other causes of vertigo having been excluded, and the usual sources of "focal sepsis" inspected (with such stress laid on any positive findings as experience dictates, for undoubtedly this question of focal infections has been very much overdone), attention will be turned to the ears.

Between attacks, the signs are few. There is usually a definite abnormality in the appearance of one drumhead, indrawing being the usual finding, and tubal stenoses are frequent. Examination of the hearing gives very variable results and sometimes the results of tests are contradictory. Perhaps it is most common to find a certain degree of loss at each end of the scale, more marked at the top. Bone conduction may be considerably diminished. Examination of the labyrinth seldom gives any information of great value. Spontaneous manifestations are unusual, although occasionally there is a little unsteadiness or some difficulty in walking in a straight line. The most constant finding, however, is some diminution of excitability to caloric tests of one or other labyrinth. Bal-denweck⁷ says that this hypoexcitability varies from day to day and may even change from one labyrinth to the other, a point of some importance in treatment.

During an attack, examination is seldom possible in any detailed way. The patient prefers to lie in a darkened room on his side, usually the affected one, and often wishes to hold on to some support. He may state that the world is going round, or merely that his head is swimming or the bed rocking. It is probable that the rotary type of vertigo indicates a stimulus arising in the semicircular canals, other varieties arising in the otolith apparatus. Nystagmus is often present, sometimes to both sides.

In sum, it may be said that neither during nor between attacks is it possible in most cases to obtain very much informa-

tion. Moreover, what we do obtain often appears conflicting, probably because we have not yet learned enough to sort it out correctly.

Treatment

The first step, as it is frequently the last, is to procure the patency of the Eustachian tubes. The next is to maintain it. In our running after the strange gods of water metabolism and vasomotor disturbances, we must not forget that a large proportion of all cases are due simply and solely to a unilateral Eustachian obstruction, the cure of which will cure the dizziness. *Eustachian catheterization*, therefore, is our sheet anchor, and not until it has been tried and failed, or been proven not to be the cause of the symptoms, should it be abandoned. As long as it improves symptoms, even if only temporarily, it should be persevered in, and with a perseverance involving patient, surgeon, catheter, bougie, over weeks and months, before being given up. One comes across patient after patient who has had three or four catheterizations and then been given up as a bad job, to wind his vertiginous way through life with nothing more than the doubtful consolation of luminal. I have been able to put many such on a stable basis by energetic and persevering treatment of their Eustachian tubes. They need encouragement at first if they are to keep at treatment sometimes for several months, but as their attacks become less frequent and less severe, their headaches disappear and their world becomes steadier, the difficulty is not to drag them to the chair but to persuade them that they need no more.

In one's preoccupation with the Eustachian tube, however, one must not forget to treat the cause of the obstruction if it can be found. It may be that a postnasal catarrh must be treated, it may be a low-lying septal spur which is interfering with ventilation, it may be an infected nasal sinus. These matters are self-evident. But with it all, the underlying principle is to get the tubes equally patent and maintain them so. Only when we fail to accomplish that by ordinary means are we justified in adopting means more exacting. Thus, once in a while, one meets with a case who is immediately

improved by Eustachian inflation, but in whom the patency of the tube cannot be maintained. Under such circumstances, the establishment of middle ear ventilation by a Kuster's or Heath's operation has proven successful.

Drugs are not to be relied upon. I have found the greatest benefit to come from luminal as a general sedative. It diminishes the severity of attacks and is a great help to these people, who are often very jumpy. Small wonder that they are when they cannot cross a street or drive a car in safety, or go to a party with any assurance that they will not vomit in the middle of it. The wonder is, not that so many are "nervous wrecks," as they so often say, but that all are not. Another useful drug is chloretone or butyl chloral hydrate, the basis of most seasick remedies. If the patient has any warning of an attack, this drug will sometimes abort it. Pilocarpine in quite small doses by mouth I have found to help some people. Bulbocapnine has been much vaunted of recent years on account of its alleged selective action on the vestibular nerve. My experience of it is very limited, but it seems no more satisfactory than many others, and more expensive.

Diet

As the result of their experiments, Mygind and Dederding⁵ recommend a salt-free diet with limited water intake, and claim to have obtained good results from it. Furstenberg⁶ has worked out, on the basis of his sodium metabolism hypothesis, a complicated diet which must be cooked without salt, and administers with it large doses of ammonium chloride. He appears to have obtained truly amazing successes. But these dietetic measures have their drawbacks. So often patients will not take the trouble to stick to them, or say they find them too unpalatable, or else they are so difficult of accomplishment as to be beyond the capabilities of many. Furthermore they are by no means infallible. Although Furstenberg's diet, in the hands of its originator and of some others, has been highly successful, I personally have not achieved any great success with it, and other otologists to whom I have spoken have been similarly disappointed. I have known a patient to have the worst

attack in his life while on a strict Furstenberg's regime in hospital. So I remain unconvinced that an alteration in sodium metabolism is the answer to our problem.

Hypertonic solutions would appear to be a more rational method of therapy than complicated diet restrictions where the cause may be an edema of the labyrinth, and particularly if the edema, or choked labyrinth, is associated with any actual rise in intracranial pressure. I have had as yet no personal experience of this line of treatment, but I am told by Dr. Foster Kennedy (personal communication) that he has had considerable success with it in the last few years, particularly in difficult cases where other methods have failed.

Operative Methods

It has been said of this condition, that not until we operate is the patient's life in danger. I disagree. Unless we control the attacks, his life is in danger every time he leaves his house. Apart from danger, I have known patients whose lives were a misery to themselves and to others from their fear of these thunderbolt attacks. I believe that in all severe and intractable cases it is absolutely justifiable to advise operation. The question is, what operation?

I have already mentioned a Kuster operation in cases of intractable Eustachian obstruction. Several other operations have been suggested from time to time. The formation of a fistula in the external semicircular canal has been tried by several surgeons (Lake, Jenkins, Mollison). The operation is not always as easy as it sounds, the canal not being so readily identified in a normal mastoid as after suppuration has destroyed the cancellous bone. Moreover the results, while brilliant at first, are often only temporary. Inferior vestibulotomy carries too great a possibility of infection from the tympanum, and Mollison's method of injecting alcohol into the external canal involves the risk of a facial paralysis. Such operations as a cerebellar decompression (Barany) or incision of the saccus endolymphaticus (Portmann) may be well enough if the underlying pathology is certain and the operation applicable, but they are scarcely to be done on speculation. There is one operative procedure, how-

ever, to which these objections do not apply. Division of the eighth nerve in the posterior fossa, though it may sound a formidable undertaking, in the hands of one accustomed to intracranial surgery carries with it no more risk than is inseparable from any operation. A number of successful cases have been published by Dandy,⁸ Coleman,⁹ and Cairns.¹⁰ An improvement on complete division of the nerve has recently been worked out by McKenzie¹¹ of Toronto, who has described a method of dividing the vestibular portion only, on the principle of selective section of the fifth nerve in trigeminal neuralgia. His results have been excellent. Not only has he obtained complete freedom from attacks with an insensitive vestibule, but in most cases hearing has been improved and tinnitus diminished.

There are two further advantages to this operation which McKenzie does not point out.

1 It is unimportant upon which side the operation is done from the point of view of relief from vertigo, for division of the vestibular nerve blocks all impulses from one side. As there is now only one functioning labyrinth there can be no imbalance. The difficulty of deciding which is

the offending side is overcome, and that side can be chosen on which hearing is most diminished in case of accidental injury of the auditory portion of the nerve.

2 Should there be a mistake in diagnosis and some lesion in the posterior fossa, it will be found and can be dealt with.

I believe this to be at present our method of choice in those severe cases in which less drastic methods have failed. McKenzie has obtained unfailingly good results in a four years experience, and although my own experience of the operation comprises only three cases, all recently treated, I can, in so far as such a small number goes, confirm his successes. But in saying this, I would not have it thought that I believe the last word has now been said. Nerve section, the deliberate destruction in perpetuity of a nervous pathway in order to relieve a symptom whose causation we do not understand, offends pathological sensibilities. At best it is but a "pis aller," a means of terminating an intolerable situation until such time as a more rational means can be found. For the moment it is a satisfactory expedient.

NINETEEN YEARS' SURVIVAL AFTER LARYNGECTOMY FOR ADVANCED CANCER

An interesting report is sent in to *The British Medical Journal* by Robert H. Woods, a Dublin surgeon. He writes:

In May 1917, a man aged fifty-one was sent to me by Dr. Sandford of Cork suffering from carcinoma involving the base of the tongue, side walls of the pharynx, and the upper portion of the larynx. The glands over both carotid sheaths were involved. I agreed with Dr. Sandford's opinion that the disease was too far advanced for operation to afford any reasonable chance of success. The patient, however, implored me to try, and I with some reluctance consented. I performed a total laryngectomy

and made a dissection of the glands at one operation. He made an excellent recovery and remained perfectly well, leading a very active life, for sixteen years and a half. He then, in November 1933, developed a recurrence immediately above the tracheal opening in the neck. This broke down, and a fistula formed through which fluids leaked during swallowing. Radium and deep x-rays were applied, the tumour disappeared, and the fistula closed. Two years later, in December 1935, he got another recurrence under the right sterno-mastoid, on which treatment had no effect, and he died recently, nineteen years and a half after the first operation.

HYPERTHYROIDISM IN CHILDREN

GEORGE E. BEILBY, M D and JOHN C. McCLINTOCK, M D, *Albany*

From the Departments of Surgery and Pathology of the Albany Hospital and the Albany Medical College

Exophthalmic goiter presents the same basic symptoms regardless of the age at which it appears. The effect of hyperactivity of the thyroid gland in children, however, produces more pronounced symptoms because of the greater emotional instability of these young patients. Likewise in children, the growth stimulus appears to bring about a more rapid progress of the disease. Hyperthyroidism in children is always a primary change of the thyroid gland, while in adults, hyperthyroidism with exophthalmos may also occur as a secondary manifestation of adenomatous or colloid goiters. We have not included in this communication that large and important group of patients, chiefly girls, with adolescent enlargement of the thyroid gland, some of whom may present mild symptoms of hyperthyroidism.

Exophthalmic goiter, or more correctly toxic diffuse goiter, may occur at any age, and although it is rare in the very old and the very young, we have seen patients suffering from this disease in the first and in the eighth decades of life. In children under five years of age the condition is so rare that each case is of unusual interest, and because of the urgent need for early diagnosis and adequate treatment, this very young group is of especial importance. Former inexperience in dealing with this problem in these very young patients has now been largely overcome, but we desire to correct some of the generally accepted views that are still retained with regard to the management of these children.

Text books of pediatrics have not kept pace with this growing experience and the advice given by these books is, therefore, far behind the present day status of our knowledge of hyperthyroidism in children. In the latest edition of one of the most widely used pediatric texts¹ is found this statement with regard to the care of

a patient with what is called the severe form of exophthalmic goiter

Surgical measures should be withheld as long as possible, particularly if the patient is near the age of puberty, at which time a readjustment of the endocrine glands may occur. It may be necessary to operate, however, if medical treatment fails and the life of the patient seems to be endangered.

Among the leaders in the field of thyroid disease, there is a well-marked unanimity of opinion that hyperthyroidism in the young is the same as that seen in the adult, and that the measures necessary for cure are identical in each age group. Further than this, and contrary to the advice given by the pediatric text books as just illustrated, it is far more dangerous to attempt to cure hyperthyroidism in the young by medical means than it is in the adult. This is true because the child retains the added factor of development that is absent in the adult. Thus, just as hypothyroidism leads to retarded development and cretinism, hyperthyroidism in the child brings about a more rapid development, which, unfortunately, affects some parts of the body more than it does others. There is a marked increase in the rate of development of the skeletal system that is accomplished at the expense of other parts of the body, notably the soft tissues. It is, for this reason, quite common to receive from the mother the comment that the child has suddenly grown taller.

The markedly increased metabolism stimulates the skeletal growth to advance beyond the age in years and at the same time this increased metabolic need deprives the body of all of its available energy. The child becomes thin, the weight may remain stationary or be actually reduced in the presence of a good or increased food intake. To provide for the proper distribution of the increased

Read before the Fourth District Branch of the Medical Society of the State of New York, Plattsburg, October 3, 1936

Fig 1 X-ray of chest in 1931 (Case 1) showing markedly enlarged heart

Fig 2 X-ray of chest in 1936 (Case 1) Heart within normal limits as to size, with regard age of patient.

amount of food material demanded by this elevated metabolic level, the heart must increase its per minute outflow and in due time the heart itself will respond to increased work with an increase in size. These observations are well-illustrated in the following patient who has been the subject of two^{2,3} previous communications, but who is here reviewed five years after her first operation

CASE 1 J S, aged eight, was first admitted to the Albany Hospital at the age of two years and nine months because of typical exophthalmic goiter which was corrected by operation. The second admission was

made necessary by a recurrence of her symptoms and goiter, over one year after the initial operation. Since this second thyroidectomy, the patient has remained well with no symptoms suggesting the return of her hyperthyroidism. She has had measles and whooping cough without complication, and she has also had her tonsils removed without difficulty. The exophthalmos present at her first admission has improved, but it has done so unequally, so that now the right eye is more prominent than the left.

From the history of the patient we are able to say that the disease had its onset before the age of one. When she was first seen in February 1931, nearly a year after the onset, her heart was found to be greatly enlarged, and on x-ray examination, measured in its greatest transverse diameter, 8.5 cm, and 4.5 cm across the great vessels (Fig 1). At the level of the diaphragm, the chest measured eleven cm across. In August 1936, at the age of eight, the heart still measured 8.5 cm in its greatest transverse diameter and 4.5 cm across the great vessels (Fig 2). The chest at the level of the diaphragm now measures 21 cm. across. It is fortunate for this patient that removal of the increased metabolic load has enabled her heart to return to and remain within normal limits.

It was not until 1933 that the skeletal system of this patient was investigated by the Roentgen ray. The report of x-rays of the wrists (Fig 3), taken in June 1933, revealed the osseous system to be developed to correspond with that of a nine year old child, yet the patient's actual age at that time was four years. In August of this year, [1936] the skeletal growth was found on x-ray examination, to correspond with that of a twelve year old child (Fig 4).

In this patient the disease had been present for a long time, nearly two years, before surgical intervention prevented further harm. There had been ample time for these changes of increased metabolism to take place and to progress. A second child received surgical treatment before "the life of the patient seemed to be endangered" and as a result no permanent developmental changes had occurred.

CASE 2 B G, aged four years and four months, was admitted to the Albany Hospital in June 1936. The history was taken from her mother, who stated that the child had always been of a "nervous type." In the Fall of 1935 the child began to lose weight, gagged easily and had a poor appetite. Because the tonsils and adenoids were en-

larged they were removed in January 1936 with the hope that this operation would relieve her distress. Following the operation, however, the child had almost continuous colds leading to a very severe bronchitis in March. During the course of this bronchitis a rapid pulse was noted for the first time and medical treatment for hyperthyroidism was instituted. After the tonsillectomy there was a rapid increase in height but no weight gain, after the treatment for hyperthyroidism was begun, the child gained three pounds in weight but the symptoms of nervousness, irritability, and weakness continued.

The child was born at full term in a normal delivery. She had whooping cough at the age of two months and chicken-pox when she was two years old. One grandmother had suffered from a goiter.

On examination the child was observed to be a tall thin girl, lying restlessly in her bed. The skin was warm and moist without unusual pigmentation. The eyes showed obvious exophthalmos with a definite stare and lid-lag. A few small, nontender, cervical lymph nodes were palpable. The thyroid gland was diffusely enlarged, each lateral lobe measuring about $4 \times 2 \times 2$ cm. The lobes had the characteristic consistency of a hyperplastic gland, hardened by iodine administration. The lungs were clear and resonant throughout without demonstrable rales. The heart was not enlarged and presented no murmurs. The extended fingers and protruded tongue showed a fine tremor.

Examination of the blood and urine failed to reveal any significant change from normal values. The Wassermann test was negative. On June 25 the basal metabolic rate based on weight by the Benedict Talbot method was plus 122.2 percent, the rate based on the height after the Benedict method was plus 87.5 percent. The following day, the values obtained for the two methods were plus 108.3 percent and plus 83.4 percent.

X-ray examination of the skeletal system showed normal development (Fig 5). Roentgenological examination of the chest, however, disclosed generally accentuated lung markings, with discrete calcifications in the parenchyma of the right lung just above the hilum and enlargement of the hilum nodes on either side. The changes were reported as being consistent with a childhood type of tuberculosis.

After prolonged preparation with compound solution of iodine, bed rest, high caloric diet, fresh air, and sunshine, the surgical attack upon her disease was planned. Ordinarily these preoperative measures will permit a one-stage operation but in

this patient several factors made it necessary to abandon this type of operation. While in the hospital the child failed to gain weight in spite of every measure. The pulse rate was 140 on admission where it remained for over one week when it dropped to 130 after which it varied between 110 and 130. There was a daily rise in temperature to 100° F, indicating activity within the lung.

Fig 3 X-ray of wrists in 1933 (Case 1) Development corresponds with that of nine year old child, yet patient is actually four

Fig 4 X-ray of wrists in 1936 (Case 1) Development corresponds with that of twelve year old child

In view of these findings, then, it was felt that a two-stage operation was imperative in this instance and accordingly the right lobe was removed on July 9 and the left lobe on July 21.

The postoperative course was stormy at first. The pulse rose to 200 after the first lobectomy and to 160 after the second. After the immediate reaction of the second operation was past the pulse remained between 80 and 100.

The temperature rose to 103° F after the first lobectomy and to 102° F after removal of the second lobe. The last three days in hospital the temperature of this patient was never above normal.

The pathologist reported extremely marked, diffuse hyperplasia of the thyroid gland.

This patient has gained weight and now weighs 45.5 pounds as compared with the thirty-five pounds she weighed on admission to the hospital. During the past week the child has had a very poor appetite. X-ray studies of the chest on October 1, revealed a slight degree of parenchymal infiltration toward the base of the right lung with enlargement of the hilar nodes on both sides, suggesting tuberculosis. Compared to the films of July 5, there has been no definite change. This disease in the lungs is now being adequately treated medically, and with the hyperthyroidism removed, should respond quickly.

Discussion

The age of puberty, variously taken as from twelve to fifteen years by different authors, is the upper age limit used in discussing hyperthyroidism in children. In this age group the incidence of toxic diffuse, or exophthalmic goiter, in relation to all age groups is given by Helmholtz⁴ as 0.87 per cent, by Rankin and Priestley⁵ as 0.6 per cent, and by others up to as high as two per cent. It seems probable that the true incidence of hyperthyroidism in children is less than one per cent of all cases of toxic diffuse goiter. The frequency of the occurrence of this disease increases as the age approaches puberty.

The female is far more commonly affected than is the male. Rankin and Priestley⁵ report that ninety per cent of their cases were female, Green and Mora,⁶ eighty-four per cent, and Helmholtz⁴ records that 86.6 per cent of his cases were girls. Jones⁷ quotes Cowden as

being unable to find, in the literature, a case in a male under ten years of age. In our own series of over 3,000 patients with all types of goiter, we have observed only eight instances of the disease, all in girls before the beginning of the menstrual epoch. The ages of these patients were two years nine months, four years four months, nine years, eleven years, thirteen years, and three cases at twelve years of age.

Frequent mention is made of preceding infections as a predisposing cause of hyperthyroidism in children. Abbott⁸ found a high incidence of onset after acute in-

Fig 5 X-ray of wrists in 1936 (Case 2). Development here is within normal limits for child of four years. Compare with Fig 3.

fectious diseases. Dinsmore⁹ and Rankin and Priestley⁵ also record the onset of the disease after an acute infection, the latter two authors note this fact in fifteen per cent of their cases. Alberts¹⁰ not only found infections as an exciting factor but also observed the onset of the disease after extreme emotional disturbances. In our two cases, one (Case 1) did not have any antecedent infection while Case 2 did have.

The symptoms and findings of hyperthyroidism in children are identical with those observed in adults. Bloom¹¹ has listed the frequency of the occurrence of symptoms as recorded by several authors from a total of 144 cases and these findings are averaged in Table I. Although weakness is only present in about two-thirds of the cases it is of diagnostic importance when present in the quadriceps muscle group.

The classical symptoms and findings of this entity are so well-known that repeti-

HYPERTHYROIDISM IN CHILDREN

Number 61

tion of them outside of the table seems unjustified. A thoughtfully taken history coupled with a careful examination of the patient will reveal sufficient evidence upon which to make a diagnosis.

The establishment of this diagnosis should be no more difficult than for an adult. It is of importance, however, that it be made early if the child is to be saved from unnecessary suffering and actual physical damage. To this end there must be excluded in the differential diagnosis, that group of patients that have been designated, for want of a better term, as 'functional'.

TABLE I.—FREQUENCY OF OCCURRENCE (%) OF SYMPTOMS IN CHILDREN, AVERAGED FROM REPORTS OF THREE AUTHORS

	(%)
Tachycardia	98.75
Nervousness	94.75
Thyroid enlargement	92.00
Weight loss	67.50
Weakness	64.50
Exophthalmos	61.50
Bruit	58.66
Tremor	56.00
Gastrointestinal disturbances	48.30
Polyphagia	40.00

In adult years this group of patients has been given many different names but it is most commonly known as cardiovascular neurosis. The counterpart of this type in children is found in the tall, thin, "nervous type" of girl, from eight to fifteen years of age. Although these patients have an increased pulse rate and increased pulse pressure, Doege¹² points out that the average for the group is lower than are these rates in patients with true hyperthyroidism. The pulse rate, moreover, is variable and fluctuates over a wide range. Bed rest usually causes a prompt decline to normal within a very short time, associated with variations due to such minor exertions as sitting up in bed. In exophthalmic goiter, on the other hand, the pulse rate is high even during sleep, and this characteristic is of diagnostic significance in children just as it is in adults.

There may be a slight staring expression of the eyes in these young patients with functional disturbances, but retraction of the upper lid is not found. The hands may be moist but they are objectively and subjectively cold as com-

pared to the uniformly warm, moist hand of hyperthyroidism. The appetite is usually poor or perverted in the functional group, the polyphagia of hyperthyroidism is striking for its absence. The thyroid gland may be slightly enlarged but it imparts a soft, pulpy feeling as contrasted with the meaty firmness of exophthalmic goiter. Seed and Poncher¹³ have pointed out that the height of these patients is above the average for the age level.

Just as there is need for prolonged study of this group of so-called functional patients in the adult, likewise, in children careful observation may be necessary to ascertain the true diagnosis. In this group, undoubtedly, belong many cases that have been erroneously diagnosed as hyperthyroidism and reported as cured by medical management.

Other diseases that must be kept in mind when confronted with a diagnostic problem are tuberculosis, chorea, and rheumatic heart disease. We repeat, a carefully taken history, a thorough physical examination, prolonged study, and the thoughtful use of laboratory aids, will solve the most difficult of diagnostic problems. The determination of the metabolic rate as an aid to diagnosis, even in the adult is a procedure in which there are many opportunities for error. It is almost impossible to obtain an accurate test in children and we feel reliance on the determination of the metabolic rate as a diagnostic measure is more dangerous than in the adult.

When the diagnosis of exophthalmic goiter is established, it is imperative that the child have an opportunity to benefit from surgical treatment. Although many types of treatment have been used in an attempt to cure this disease, there has yet to be introduced a method in which the mortality rate is as low and the end results as satisfactory as those obtained by operation. In the literature of the last ten years is found a growing number of authors who advise operative intervention early in the course of the disease. Jackson¹⁴ says early surgery is necessary, Cattell¹⁵ goes farther to say that medical treatment will not cure and that x-ray treatment is not so satisfactory as surgery, Morse¹⁶ feels that drugs are as useless as they are in adults. Rankin

and Priestly⁵ feel that no form of medical treatment gives sufficiently permanent results to eliminate the need for ultimate operative interference. It is, therefore, no longer necessary to admit inexperience with the problem, surgery is uniformly advised by those who have the largest understanding of the problem of hyperthyroidism in children.

The abuse of iodine has been one of the greatest mistakes made in the treatment of hyperthyroidism in all age groups. It has been repeatedly shown that the maximum benefit is obtained from this drug in from ten to fourteen days and that thereafter the same improvement can never be so satisfactorily obtained again. It does far greater harm to any patient with exophthalmic goiter to prescribe iodine than it does to do nothing for such an individual. Both McGee¹⁷ and Newman¹⁸ have emphasized the importance of being prepared to operate once iodine therapy is started. We feel that the drug may be used in very small doses as a therapeutic aid in making the diagnosis clear, but if exophthalmic goiter can be said to be present, we do not prescribe iodine in any form except as a part of the preoperative management of the patient.

The technic of thyroidectomy as done upon these youthful patients has been changed as a result of increasing experience with the problem of hyperthyroidism in children. It is well-agreed that iodine has reduced the dangers of the operation and for the most part has eliminated the need for multiple stage operations. It was formerly believed that the growing needs of the child required that slightly

more thyroid tissue be left *in situ* than was the custom in adults. In a previously reported review of this phase of the problem it was stated that "experience may teach us that the thyroid gland may regenerate more rapidly in the young," and our own experiences have proven this to be correct. Alberts¹⁰ asserts that it is difficult to be too radical in the removal of the thyroid gland in children because of its inherent tendency to hypertrophy and we are in agreement with him. It is now our custom to remove as much if not more thyroid tissue from the young patient than from the adult patient suffering from exophthalmic goiter. The recurrence that required a second operation in Case 1 exemplifies our present attitude.

Summary

1 Two cases of exophthalmic goiter occurring in children under five years of age are reported, one is a review five years after the initial operation.

2 It is now agreed that early diagnosis and early surgical intervention are imperative if detrimental physical changes are to be prevented. The inadequate treatment of this subject by the text books on pediatrics is pointed out and the results of delayed operation illustrated.

3 We believe that it is necessary to remove slightly more tissue from the thyroid gland of the young patient than is the custom in the adult patient. This is not in agreement with most of the opinions expressed in the literature today.

CLINICAL EXPERIENCE WITH COLLOIDAL SULPHUR

In Treating Mixed and Hypertrophic Arthritis

M MELVIN CLARK, M D, *Rochester*

Recently, a number of authors have reported clinical and laboratory results in chronic arthritis with the use of colloidal sulphur by injection. Discounting the natural enthusiasm which unconsciously creeps into clinical interpretation of results obtained, the results reported have been such as to merit consideration from every one treating chronic arthritis.

It was the author's privilege to have personally observed the clinical course of a majority of the 892 cases recently reported by Wheelton¹ after treatment with colloidal sulphur. From this observation two personal conclusions were drawn. *First*, that the most satisfactory results were obtained in the cases of hypertrophic or mixed arthritis, *second*, that other things being equal, those cases of hypertrophic or mixed arthritis receiving the larger doses of colloidal sulphur showed the best results. With these conclusions in mind, and being convinced of the relatively low toxicity of the material,² twenty private patients suffering from hypertrophic or mixed arthritis were treated with relatively large doses of colloidal sulphur by intravenous injection.

The material used was an aqueous solution of colloidal sulphur, marketed as Sulisocol, each c.c. containing ten milligrams of colloidal sulphur. The following details of the technic used bear repeating.

The material was warmed to body temperature and was given with the patient recumbent and relaxed, the injection rate was approximately one c.c. per thirty seconds, the patient remained recumbent for approximately five minutes following the completion of the injection, injections were made with a 25 gauge hypodermic needle.

There were no reactions such as fever, nausea, loss of appetite, etc., noted in any of the twenty cases here reported. It is the author's opinion that the technic just described is perhaps responsible for the freedom from reaction noted. A majority of the patients had had previous

forms of therapy either before consulting the author or prior to receiving the sulphur injections. Seventeen of the cases were ambulatory, two were cases of impacted fracture of the neck of the femur with coincidental arthritis, and one a case of acute back strain complicating a troublesome hypertrophic arthritis of the spine. The latter three cases were treated primarily as bed patients.

The following five case histories are recorded as representative of the group.

CASE 35 Mixed arthritis, housewife, age thirty-four. Her complaint was painful knees, hips, and feet. The present illness had a sudden onset in the right shoulder in March 1935. Previous treatment consisted of removal of tonsils, extraction of one questionable tooth, heat treatments to the knees, and repeated aspirations of knees. At the start of our care, patient had twelve weekly injections of 0.3 grams of neoarsphenamine intravenously, with graduated subcutaneous doses of an autogenous vaccine made from her tonsils. *Examination* Height 5' 4", weight 120 pounds, normal weight 145 pounds. Both hips, knees, ankles, and right shoulder were acutely involved. Fluid was present in both knees, and there was local tenderness in knees and right shoulder with crepitation on motion. There was a flexion deformity of about thirty degrees in each hip, fifteen degrees in each knee, and the right shoulder was adducted thirty-five degrees. There was much pain on motion of the knees, ankles, hips, and right shoulder. Patient was unable to stand without assistance, body mechanics were poor. Teeth were in fair condition, and the tonsils had been cleanly removed. Much fecal stasis present. Heart showed no gross abnormalities, pulse seventy, blood pressure 124/80. Treatment included diet regulation to correct constipation and limiting an excess of carbohydrates. Pregl's solution (10 c.c.) injected in each knee on two occasions to aid in shrinking the synovial membrane.³ Foot soaks, arch supports, foot and postural exercises were also included in the treatment. Following the course of neoarsphenamine and vaccine, the patient still had painful swelling in the knees, ankles, and right shoulder. The

patient was then given 1060 milligrams of colloidal sulphur in a period of three months. Three months after completion of the sulphur injections and without further treatment, the patient had no deformity, practically no discomfort, and gets about doing housework daily. Blood examination before and after treatment with sulphur was not particularly significant.

CASE 9 Mixed arthritis, housewife, age sixty-four. Her complaint was painful right shoulder with a duration of four months. Present illness had gradual onset without definite accident. Previous treatment consisted of nine intravenous injections of iron cacodylate, heat and massage locally. *Examination* Height 5' 6", weight 120 pounds which is normal. Patient is of the thin asthenic type. Both shoulders, knees, and ankles showed involvement with thickening of capsule of right shoulder, knees, and ankles. There was local tenderness in right shoulder and ankles, as well as some definite crepitation in the right shoulder and knees. No Heberdens nodes were present. Adduction right shoulder to forty-five degrees. General examination showed a faulty posture with some dorsal round back and with hyperextension of the spine and with some visceroptosis. Feet third degree pronated, with second degree depressed anterior arches. The teeth were in good condition, and the tonsils showed no gross evidence of infection. Intestinal tract showed considerable fecal stasis, no other foci noted. Heart was normal, lungs clear, pulse sixty, blood pressure 140/86. No abnormalities noted in blood examination. Treatment included diet regulation to correct constipation including restriction of the quantity of carbohydrates, sodium salicylate and potassium iodide in small doses, thyroid extract grains $\frac{1}{2}$ t.i.d. P.C., postural exercises, proper corset, arch supports. Moderate amount of progress under this program. Patient then given 360 milligrams of colloidal sulphur intravenously over a period of three weeks. Two months from the start of sulphur therapy there was very little limitation of motion in the right shoulder. There was less thickening of the right shoulder, knees, and ankles, and subjectively, the patient was relieved.

CASE 1 Mixed arthritis, housewife, age sixty-one. Her complaint was pain in neck, hands, back, and knees. The present illness extended over a period of about one and one half years. Other illnesses were posterior fissure, internal hemorrhoids, pneumonia, and influenza. Patient has suffered from constipation. Previous treatment consisted of salicylates and sedatives.

Examination Height 4' 9½", weight 125½ pounds, normal weight 127 pounds. There was a slight flexion deformity in the left knee. Local examination showed swelling in the left knee. Local heat and local tenderness in the left knee. Thickening of the capsule in both knees. Limitation of motion in the back. Crepitation in both knees and fingers. Heberdens nodes of the hands. Subjective pain. General examination revealed a faulty posture, feet third degree pronated. Teeth and tonsils out. Intestinal tract showed some fecal stasis, no other possible foci noted. Heart normal, lungs clear, pulse eighty-eight, blood pressure 120/80. Basal metabolism rate June 29, 1935 was plus sixteen per cent. On April 9, 1936 r.b.c. was 4,540,000, w.b.c. 7,000, eos two per cent, lymph twenty-seven per cent, monos three per cent, Sedimentation rate 0.70 mm/min. From October 11, 1935 to March 5, 1936, patient received 780 milligrams and from June 18 to July 30, 1936, received 220 milligrams of an aqueous solution of colloidal sulphur.

On June 4, 1936, the left knee was injected with Pregl's solution to assist in shrinking the synovial membrane. The progress has been very satisfactory. Flexion deformity of the left knee corrected, no local heat in any joints, less thickening of joint capsules, less crepitation in knees. Subjectively, quite comfortable without further treatment.

CASE 65 Hypertrophic arthritis, machinist, age thirty-seven. His complaint was low back pain in the left sacroiliac region. Patient has had some backache since an attack of "flu" three years ago, but has never had to stop work. Patient also had sinusitis two weeks ago. He has had frequent colds, but no previous joint symptoms. Previous treatment consisted of drainage of sinuses two weeks ago, but no treatment was given for arthritis. *Examination* Height 5' 10", weight 187 pounds, normal weight 175 pounds. The lumbar spine and left sacroiliac were involved. No deformity. No swelling and no local heat. No thickening of the capsule. Local tenderness over the sacroiliac joint left, confirmed by rectal examination. Limitation of motion in the lumbar spine on bending forward. No crepitation. No Heberdens nodes. Subjective pain on bending or lifting. General examination showed a faulty posture with dorsal round back and some hyperextension of the spine. Slight total left scoliosis, prostate not enlarged, feet badly pronated. Teeth show signs of pyorrhea. Tonsils out. Some fecal stasis. Heart normal, lungs clear, pulse seventy-two. X-ray showed hypertrophic arthritis of the spine. Treatment

consisted of seven doses of iron cacodylate, vitamin D gtt XX b.i.d., regulation of diet restricting carbohydrates, an elimination day program, sodium salicylate and potassium iodide in small doses. The cystine sulphur showed 98 per cent at end of this time. Patient then received a total of 420 milligrams of an aqueous solution of colloidal sulphur over a period of five weeks. The spine has remained free of muscle spasm in motion, range of motion complete, subjectively relieved, no deformity and is able to lift heavy weight without pain.

CASE 37 Mixed arthritis, housewife, age fifty-six. Her complaint was pain in right knee and joints of left hand. Present illness is a gradual onset for nine years with remissions, the last being March 1935. Symptoms present for past ten months. Has skipped heart beats at times, no other particular illness. Patient noted that joints are worse when constipated. Previous treatment consisted of osteopathic treatment, vaccine treatment, and combination arch supports. Examination: Height 5' 3" weight 154 pounds, normal weight 150 pounds. Patient is a short stocky type of person. Both knees and hands were involved. Swelling of the right knee, left knee, local heat of the right knee. Thickening of the capsule of the right and left knee, interphalangeal joints of the hands. Local tenderness of the right knee. Limitation of motion of the right knee, unable to extend beyond position of deformity (15 degrees flexion). Crepitation of both knees. Heberdens nodes of the fifth finger left. Subjective pain on motion of the right knee. General examination showed a faulty posture, feet badly pronated, abdomen prominent. Teeth all removed. Tonsils out. Some fecal stasis, no other possible foci noted. Heart examination revealed soft systolic murmurs with some skipped beats, pulse seventy. X-ray of the right knee showed hypertrophic arthritis. Treatment consisted of (1) An injection of the right knee with Pregl's solution. (2) An elimination day program. (3) A diet restricting carbohydrates. (4) Sodium salicylate and potassium iodide in mild doses. (5) Combination arch supports. (6) Thyroid grains $\frac{1}{2}$ t.i.d. P.C. There had been a moderate amount of improvement. Patient then received 660 milligrams of an aqueous solution of colloidal sulphur over a period of one month. February 29, 1936, less local heat of the knee, still considerable thickening, the left ankle still puffy and thick. Subjectively feeling better. On September 5, patient was examined again without further sulphur or other therapy. The right knee

was much less thickened. There was a flexion deformity of less than five degrees remaining. Local heat and tenderness practically gone. Subjectively quite comfortable. She does housework and climbs stairs without difficulty.

Of the twenty cases reported, the average age was fifty-three years. The average total dosage has been 600 milligrams, smallest total dosage 360 milligrams, highest total dosage 1060 milligrams. The average dose per week of treatment was 126 milligrams—one patient receiving as high as 235 milligrams per week for two weeks without reactions.

Results were classified as subjective and objective. The objective results took into consideration the following factors: swelling, muscle spasm, thickening of joint capsule (if palpable), local temperature changes, tenderness, active and passive motion, and degree of deformity. The subjective results rested with the patient's opinion as to relative pain, stiffness, and general well-being before and after treatment. In this small group of twenty particularly selected cases, all showed definite objective improvement. One case, showed very marked objective improvement in the way of freedom of motion and disappearance of muscle spasm in her back, following treatment, but continued to have subjective complaints of severe back aches. Narcotic addiction is felt to have played some part in this particular case but we have classified this case as unimproved. Two other cases admitted but slight subjective improvement, one having hypertrophic arthritis of the spine being able to return to work as a foundry foreman, however, the second, a woman of seventy-five admits she has less pain in her knee than before sulphur treatment, but still complains of some stiffness.

It is to be noted that (1) each patient had a careful investigation as to foci of infection, (2) without exception, there was noted definite delayed elimination from the bowel, for which correction was attempted by means of diet, mineral oil, agar emulsions, dosage with brewers yeast, and where practical, with abdominal exercises and abdominal massage, (3) correction of faulty body mechanics was carried out as fully as possible, (4) diet was regulated to avoid an excess of

carbohydrates, (5) early in the period of injections, the patient received mild doses of sodium salicylate and potassium iodide—this was not continued after stopping the injections, (6) the usual individual dose of colloidal sulphur was sixty milligrams at two to three day intervals, (7) laboratory examinations of blood and for cystine sulphur content of the nails were not complete enough to be conclusive

Summary

1 Twenty especially selected cases of mixed and hypertrophic arthritis, having an average age of fifty-three years, have received relatively large doses of colloidal sulphur (Sulisocol) by the intravenous method, in conjunction with other general health measures

2 All the cases were objectively improved, as judged by subsidence of swelling, relief of muscle spasm, decrease of thickening of joint capsule (where pal-

pable), disappearance of any increased local temperature, decrease in tenderness, increase in, or return to normal range of motion, decrease in deformity

3 One case admitted no subjective improvement Two cases admitted but slight subjective improvement

Conclusions

1 The use of relatively large doses of colloidal sulphur (Sulisocol) in twenty selected cases of mixed and hypertrophic arthritis has proved a valuable adjunct in treatment

2 No reactions were noted in any of the cases observed

RADIOACTIVE SALT AS A REMEDY

Common salt, rendered radioactive, can be used for cancer and other diseases in human being, reports Gobind Behari Lal, Universal Service Science Editor in the New York *American*

Experiments were made on two men at the University of California Medical School by Drs Joseph G Hamilton and Robert S Stone

It was found no harmful effects whatever were produced by injecting solutions of radio-sodium into the veins of the two men

Sodium, a metal, is present in common table salt It was made radioactive when subjected to neutron rays produced by the cyclotron machine invented by Dr E O Lawrence, at Berkeley, Calif

Whether it is pure sodium or in the form of common table salt, under neutron treatment it begins to act like radium itself Such radio sodium, or radio-common salt, gives out rays like those of radium

Hence radio sodium can be used for giving radium therapy In fact, it is declared far better

While the real radium substances, taken internally, usually cause fatal poisoning, and sometimes cancer, the radio-sodium prepared

by the California scientists is safe

Drs Hamilton and Stone say that real radium keeps on exploding within the body for many years, while the radio sodium used in these tests quiets down to half its original activity in fourteen or fifteen hours

No permanent exploding or radio particles are left in the body long enough to cause fatal sickness

The brilliant part of the work was to observe exactly how the injected radio sodium solution moved about inside the body It was thus seen how long sodium molecules stay in the tissues, when they are eliminated, and how soon the radio activity diminishes

All these facts were essential before a truly scientific, safe and effective remedy could be found in internal use of radioactive substance

Sodium, eaten daily as common salt, is one of the most important minerals in body activity Many diseases are due to disturbance of sodium or potassium balance

Instruments such as various types of electrosopes placed close to the human body can detect the presence of radio sodium or any such material

STREPTOCOCCUS MENINGITIS

Report of Two Recoveries

FREDERICK COONLEY, M D, F A C S, *St George*

Streptococcus meningitis is a rare disease with a very high mortality. It is seen first more frequently by the surgeon, because the great majority of these cases occur as a complication of otitis media, mastoidectomy, tonsillectomy, a sinus infection, or an infected wound of the head.

In 1932, Applebaum¹ in a review of the literature, found only forty-six cases of reported recoveries, including three of his own. Gray's² survey in 1935 revealed sixty-six recoveries since 1901, including one of his own. Mortality figures are estimated from ninety-seven to ninety-nine per cent. Since the establishment of the meningitis division of the New York Department of Health in 1910, Dr Josephine B. Neal³ reports 238 cases of *streptococcus meningitis* with twelve recoveries, giving a mortality of 94.9 per cent.

The treatment is not yet standardized. The value of sera is not yet established and the method of administration is under discussion. Neal⁴ advises the intraspinal route only, unless serological study shows a bacteremia. Fleischmann⁵ claims his experiments prove that intravenously given serum shows practically the same concentration in the spinal fluid, after twenty-four hours, that it does in the blood, and that medication given intraspinally is not effective. It is for the purpose of aiding in clarifying this important question of the treatment of *streptococcus meningitis* that the following cases are reported in detail as to treatment.

Case Reports

CASE 1. Girl, eleven years old, entered Staten Island Hospital Feb. 18, 1934 on my service. Temperature 101.2°F, pulse 130, respiration thirty-six. A sister died a year before of *streptococcus meningitis* following a mastoid operation. Other family history was negative.

A month previously she had a glandular swelling of the neck. This subsided in two weeks. Two weeks previous to admission to

hospital, after having pain in left ear for twenty-four hrs., a discharge of serous fluid began, which had continued ever since. X-ray confirmed clinical diagnosis of acute mastoiditis on Feb. 20. An operation for mastoiditis was performed by Dr. V. G. Smith, and pus and extensive necrosis was found. Temperature rose to 103.2 the day following operation, but in two days dropped to normal with clinical improvement. On evening of Feb. 24 temperature rose to 104 with symptoms of meningitis developing. The following day twenty-five c.c. of cloudy spinal fluid was removed under pressure. The temperature remained at 105 and clinical picture grew worse—headache and restlessness were more severe, patient becoming listless and drowsy. The spinal fluid showed w. b. c. count of 3,600 per c.m.m., positive for globulin, sugar negative. Smear showed no organisms, culture showed a pure growth of *streptococcus hemolyticus*. A culture from the wound showed the same growth. The patient was talking irrationally and involuntarily, vomiting appeared for the first time. The situation appeared hopeless. My associate, Dr. W. Lynn Halbert, suggested that Lederle's *Erysipelas Streptococcus Antitoxin* be tried, and this treatment was instituted under his supervision. At 3 P.M. (Feb. 26) six c.c. of this serum was injected in the buttock. At the time the temperature was 104.8, pulse 124, respiration twenty-six. Patient was incontinent and irrational. Ten c.c. were injected intramuscularly at 10 P.M. In twelve hours the improvement was marked. Temperature fell to 102.4, patient became rational and continent, vomiting ceased. Thirty-five c.c. of cloudy spinal fluid was withdrawn under pressure of 300 mm., cell count 1470 per c.m.m., globulin, trace, no sugar. There was no growth on culture and no organisms found on smear in this or the seven subsequent spinal taps. On the 27th, two doses of ten c.c. each were given intramuscularly. On the following day six c.c. of serum was given intraspinally, following a tap of twenty c.c. of cloudy fluid under pressure of 150 mm. and four c.c. given intramuscularly. Within twenty-four hours the temperature fell to below 100 and remained there for a week. On March 1 six c.c. of serum was given intraspinally. The following day five c.c. was given intraspinally.

and five c.c. intramuscularly. Five c.c. was given daily until March 6, then again on the 8th. On March 8 and 9 temperature rose to 101. Patient began complaining of severe head, eye, and tooth pains, and occasional pains in various parts of the body. The clinical picture grew worse for three days. An intracranial abscess was suspected. Stereoscopic x-ray of skull was negative. Sedimentation rate sixty-six, blood, hemoglobin seventy-eight per cent, r.b.c. 4,120,000, w.b.c. 14,000, s.l. thirteen per cent, l.l. five per cent, polys. eighty-two per cent, band forms two per cent. Repeated neurological and ophthalmological consultations were negative. The spinal taps on March 8 and 9 were clear, pressure 200-240 mm., w.b.c. 140-180, sixty per cent lymphocytes, globulin two plus, faint trace of sugar. On March 12 temperature rose to 103.6 and the next day to 104.4. On March 13 under an anesthetic, the wound was opened, all granulations removed, bone was healthy, lateral sinus appeared normal. Twenty c.c. of cloudy spinal fluid withdrawn and five c.c. of serum introduced, also five c.c. given in the buttock. The spinal fluid showed cell count of 2,230, lymphocytes predominating, sugar normal, globulin plus. The following day patient improved, temperature falling to 101. Two days later two c.c. of serum was given intraspinaly and five c.c. intramuscularly. This was the last administration of serum.

The day following the temperature fell to 100 and ranged between normal and 100 for ten days. A culture of the wound was not made for several days after operation, but showed streptococcus hemolyticus. A vaccine was made of this and beginning March 1 small increasing doses were given daily for three days and later at three and four day intervals. All blood cultures were negative. All laboratory work was done personally by our pathologist, Dr. Penke. The patient was typed and cross-matched, preparatory to transfusion, but none was deemed necessary. Ten spinal taps were made. Ninety-nine c.c. of serum in seventeen doses was given—five intraspinaly (with a total of twenty-four c.c.) and twelve intramuscularly (with a total of seventy-five c.c.). Treatment was begun on the second day of onset. Whether the second attack was a lighting up of the meningitis or a reinfection from the wound is debatable. All symptoms subsided after two spinal injections of five c.c. each and two intramuscular injections of five c.c. each, together with a thorough curettement of the wound.

CASE 2 A policeman, aged twenty-nine, admitted to St. Vincent's Hospital April 25, 1935, unconscious as a result of an automobile accident. There were multiple bruises and abrasions, a three inch scalp wound of the forehead, left conjunctival hemorrhage with closure of the eye, and swelling and tenderness over lower dorsal and upper lumbar vertebrae. He became more irrational and restless. The next day it was necessary to remove him to the cell. Under paraldehyde and fifty per cent glucose intravenously he quieted down in twenty-four hours. No M.S. was given because of suspected abdominal lesion. His temperature was 103.6°F on April 27. There was redness around scalp wound and a cloudy serous discharge. Report of culture the following day was "pure extensive growth of hemolytic streptococcus." Sutures were removed and wet dressing applied. The mental picture cleared somewhat. Complained of tingling pains in leg and difficulty in voiding and general muscular pains. Temperature ranged from 99-102. Except for a spreading cellulitis of scalp patient's general condition improved. On May 2 he became incoherent, attempted to get out of bed, removed dressings. Temperature was 103.4. There was a weakness of left facial muscles and photophobia. Pupils reacted equally to light. Rigidity of neck muscles was present. Spinal tap showed fifteen c.c. of cloudy fluid under normal pressure. Owing to formation of a web, cell count could not be made. Polys were eighty-one per cent, small lymph. eleven per cent, mononuclears two, metamyelocytes six, globulin increased, sugar 0.010 per cent, no bacteria on smear or culture. Blood culture negative. The patient was seen by Dr. Samuel Reback and diagnosis of meningitis confirmed, but the diffuse neurological findings made it necessary to consider a possible traumatic encephalopathy. Having seen case No. 1 in consultation, Dr. Reback agreed to the use of the same erysipelas serum. At 5:30 p.m., ten c.c. was given intraspinaly and intramuscularly. Patient was very restless the early part of the night but slept at long intervals toward morning. The next day, (May 3), patient was much brighter, appetite good, temperature 102. Headache still severe. Neck rigidity same. Ten c.c. of serum given intraspinaly and intravenously. Spinal tap under pressure gave twenty c.c. less cloudy, cell count 4000—eighty per cent polys, twenty per cent lymph, no bacteria on smear or culture, globulin marked increase, sugar 0.0010 per cent. Stereo of skull showed no signs of fracture or sinus involvement. On May 4 condition

steadily improved, temperature gradually falling to 100.2, cellulitis subsiding rapidly, and discharge from wound less. Ten c.c. serum given intraspinally and intramuscularly. Superficial abscess on dorsum of foot opened. Culture sterile. Spinal tap less cloudy, cell count 491, globulin markedly increased, ninety per cent polys, ten per cent lymph., smear and culture negative.

May 5 improvement continued. Temperature range 100.2-100.8. Ten c.c. serum given intravenously. No change in spinal tap. May 6, symptom-free except for occasional headache and temperature 100-100.4. After two c.c. of serum had been given intravenously the patient grew pale, experienced air hunger, and tachycardia. One c.c. of adrenalin by hypo checked reaction and the remaining serum was given intramuscularly. Temperature remained normal till discharge on May 11.

The only other therapeutic measure tried was spinal drainage with hypertonic salt solution which yielded only twelve c.c. This was tried on the second day of the meningitis. There were nine doses of serum given, three intraspinally totalling thirty c.c., three intravenously totalling twenty-two c.c., and three intramuscularly totalling twenty-eight c.c. The administration of serum was begun within twelve hours of discovery of meningeal symptoms. Five spinal taps were done. The patient was typed and cross-matched but transfusion was not necessary. Patient was discharged on the fourteenth day and remained two weeks in bed at home, requiring small doses of phenobarbital to allay nervousness and headaches.

It was with great hesitancy that case 2 was reported as a streptococcus meningitis. But after consultations with Dr. Neal and Dr. Margit Freund-Klemperer, pathologist at St. Vincent's Hospital, and a study of the spinal fluid findings together with the clinical picture, it was deemed justifiable.

The history of concussion, and an extensive cellulitis of the scalp that showed streptococcus hemolyticus, the low sugar and high poly count in the spinal fluid, and the intensity of the onset, would indicate a bacterial meningitis. A serous or meningitis sympathica could easily give a high cell count, but the sugar would not be diminished. In this case the sugar content was rechecked carefully by Dr. Freund-Klemperer personally. In the first case there was one positive spinal culture, but no bacteria were found on smear or

culture after giving two doses of serum intramuscularly. Treatment was begun on the second day. In the second case treatment based on the wound culture was begun within twelve hours of onset of symptoms of meningitis and no organisms were found in the spinal fluid on smear or culture. The first case received auto-vaccine because of the duration of symptoms. In the second case one saline irrigation of the brain was tried but without success. The last intravenous dose gave a marked reaction. No more than one spinal tap per day was done in either case and then only when deemed necessary. Supportive treatment with all the sedatives necessary was carried out.

In the first case ninety-nine c.c. of serum was given, twenty-four c.c. intraspinally and seventy-five c.c. intramuscularly. In the second case, a robust adult, eighty c.c. of serum was given—thirty c.c. intraspinally, twenty-eight intramuscularly, and twenty-two c.c. intravenously. In reviewing the treatment of the recovered case, there is noted a marked tendency to more conservative and supportive treatment.

With due allowance for spontaneous recoveries, and in view of the high mortality of this disease, the use of serum in these two cases may be of some significance. Its use is harmless within simple limitations. In surgical head cases showing streptococcal infections the possibility of meningitis should be constantly borne in mind and treatment instituted at the earliest possible moment. In the first case the failure to make a culture at the time of operation caused two days delay in beginning treatment. The patient, a child, received more serum and was acutely ill for a longer period than the second case, an adult.

In reviewing the various sera used in the reported recoveries, these are only cases in which Lederle's Erysipelas Streptococcus Antitoxin was used. In Gray's series of sixty-six recoveries, serum therapy was employed alone or with other measures in twenty-two cases.

Summary

1 Two recoveries from streptococcus meningitis are reported, making the total reported cases sixty-nine.

2 Twenty-four of the sixty-nine cases were treated by various streptococcus sera

3 The question of the best method to introduce the sera is unsettled—all three methods were used in these cases

4 The importance of watching for the onset of meningitis symptoms in all cases of streptococcal infection is stressed and the institution of treatment begun without delay

5 From the result in these cases, the use of Lederle's Erysipelas Antitoxin, which is everywhere available, and harmless, seems worthy of a trial in this rare disease

Addendum

Since writing this article Case 2 remained well until April 1936 when he had a series of seizures of the Jacksonian type involving the right side of the face and neck. In August, this was repeated followed by several of the grand mal type. Since there has developed very marked personality changes

NEW LOCAL ANESTHETIC

A new local anesthetic that combines the actions of novocain and epinephrine, while at the same time, it is hoped, eliminating some of the dangers inherent in one or the other of the two substances, is reported in *Science*, official organ of the American Association for the Advancement of Science

The new anesthetic, which so far has been used only on animals, is described by Dr. Raymond L. Osborne of the DeLamar Institute of Public Health, College of Physicians and Surgeons, Columbia University

"One of the disadvantages of novocain (procaine) and its known relatives," Dr. Osborne says, "is that they tend to dilate the peripheral blood vessels. They cause a pronounced fall in blood pressure, as does cocaine in the ordinary concentrations

"We report the discovery of a new local anesthetic which is vasopressor"

That is, instead of dilating it compresses the blood vessels, and thus reduces the danger of bleeding

Epinephrine, which is the hormone secreted by the medulla of the adrenal gland and is also known as adrenaline, had been found about thirty years ago to enhance the effect of cocaine and later was found to be similarly efficient with novocain. Novocain by itself dilates the blood vessels and hastens the exit of the anesthetic from the site of action. With the addition of the epinephrine the duration of anesthesia is

prolonged for more than an hour, so that the concentration of the anesthetic can be considerably lowered. The danger of poisoning is also decreased

These results are due to the constriction of the blood vessels produced by the epinephrine, which practically arrests absorption of the novocain into the circulation

"On the other hand," Dr. Osborne adds, "the nervousness induced by epinephrine in hypersensitive individuals is objectionable, further, it may make them susceptible to cocaine collapse. The epinephrine combination, moreover, is useless on the intact cornea and for intravenous and subdural injections. Also, novocain and other known synthetic derivatives tend to increase bleeding

"In 1931, under the supervision of Professor Nelson and Dr. Powell of the Department of Chemistry, Columbia University, we began the preparation of a compound that would combine the actions of epinephrine and procaine. After discarding many such drugs because of undesirable effects we have finally synthesized epicaine, which is both a local anesthetic and a vasopressor"

The technical name for the new drug is alpha (3, 4-dihydroxyphenyl) beta (para-aminobenzoyl)betadiethylaminoethanol) alphasphaethanonehydrochloride, designated for brevity as epicaine

PALESTINE MEDICAL CENTER

fessor of Parasitology at the Hebrew University in Palestine on Jan. 31. Two hundred and fifty attended

RETINAL METHOD OF IDENTIFICATION

New System of Classifying Retinal Patterns

CARLETON SIMON, M D, *New York City*

Criminologist of the International Association of Chiefs of Police, New York State Association of Chiefs of Police and the New England Association of Chiefs of Police

At the Convention of the International Association of Chiefs of Police, held in Atlantic City, N J in 1935, I presented a method of identification which involved the use of the fundus, retina or background of the eye. Dr Isidore Goldstein, Visiting Ophthalmologist to Mt Sinai Hospital and other hospitals in the City of New York, collaborated in this research then and since in obtaining photographic instruments, assembling clinical data, and securing retinal photographs of patients in the Mt Sinai Hospital and the New York Eye and Ear Infirmary. Only those who had no serious eye lesions were selected. Photographs of numerous twins were also obtained.

During the past year, Mr Allan Brooms, a research engineer of New York City, has also collaborated with us. His graphic devices contributed in the development of the system of classification here presented. He designed various appliances, one by which an individual photographic negative can be automatically registered for filing purposes. He also originated a terminology to define units of an angle which has been conveniently used by us.

Shortly after our first publication¹ of the use of the retina as a new method of identification, it came to our notice that attempts in this field had previously been made, our attention being called to monographs in French and German Archives. In our independent research, we used then as we do at present, the only available camera, which is manufactured by Carl Zeiss, Inc., of Jena, Germany, whose American representatives gave us fullest cooperation, but who likewise were not aware of any prior work done in this direction.

On translating these papers, we felt encouraged in the support they gave to

our own conclusions, namely, that the blood vessel patterns in the retina from birth until death differ in each individual, even between the right and left eye, and furthermore that this fact furnished a sound foundation upon which to base a scientifically accurate means of identification. It may be timely and it is certainly interesting to review in a general way these various earlier approaches.

Levinsohn, (Berlin, 1899) an ophthalmologist, believed that identification might be unquestionably made through the arrangement and division of the blood vessels of the fundus of the eye, these being unchangeable. He mentioned no system of classification and his entire observations were made through the visual ophthalmoscope. He had no retinal camera.

It is common knowledge that the first attempt to photograph the retina, and then solely for medical purposes, was made by Noyes (America in 1862) and by Bagneries (France in 1889). These were admittedly crude attempts. Gerhoff and Meissner in 1891 also tried to take photographs of the retina through the use of a water chamber and succeeded in obtaining some serviceable pictures.

The first practical camera was devised by the Vienna Ophthalmologist, Dimmer, and was constructed in the Zeiss works through the cooperation of Kohler and von Rohr. The present retinal camera, with vast improvements over preceding ones, was designed by Prof Nordenson of Upsala University. This is the camera used by us.

Dr Leo Haber, in a short monograph entitled "Retinoscopy for Criminal Identification," stated² "The only difficulty that exists is that there will be difficulty in classifying this system for identification."

At the present time there is no system whereby a proper classification and filing are possible." He did suggest the magnification of the photograph and the employment of a screen and also the use of the

Read at the Annual Convention of The International Association of Chiefs of Police, Kansas City, Mo., September 21-24, 1936

optic nerve as a fixed center, this last a most natural and obvious geometrical and anatomical point. He was likewise of the belief that the blood vessels of the retina were beyond the power of any individual to change. Leo Haber was himself criticized by R. Heindl, to the effect that his work

of slight use because of the difficult technique employed by Levinsohn.

The next worker in this field was Blascheck, another ophthalmologist, who tried various methods, but never published his results. At his death a friend and associate, Dr. Turkel, took this data and tried to com-

Fig 1 The Retinal Protractor. Circumference divided into 100 "Centigrees." Classification circles respectively ten and five mm from the center.

was not original and that he had overlooked that done previously by Levinsohn.

Edmond Locard and Capdevielle also made some suggestions and criticisms but did no research in this direction, neither attempting nor being responsible for any system of filing or classification. Locard, among other subjects, suggested the eye as a means of identification, by using the color of the iris, interpupillary distances, corneal and orbital measurements. His only reference to retinal measurement was that it was

plete the ideas expressed in them. Blascheck had been a pupil of Dr. Dimmer, who was the first to develop a practical retinal camera, and who also took and assembled a large number of retinal photographs illustrating pathological eye conditions. Dr. Dimmer also died before Turkel could secure his counsel and cooperation in completing and arranging the notes left by Blascheck. It may also be interesting to note that Turkel gave expression to the criticism that the work done by Haber was

only suggestive, too meager to build up a classification and identification system. Turkel attempted various methods—a routine which anyone would likely employ in groping for some standard method. He drew various parallel lines upon the photographed retina and endeavored to classify retinas by

In our search for a standard method of classification, a great many ideas were subjected to trial. We were of the opinion as was Haber, that the use of a meshed screen photographed simultaneously on the negative of the picture might

Fig 2 T N Scale of one millimeter unit divisions, imprinted during photographing of retina, showing degree of magnification.

the count of the various arteries and veins that intersected them. He also used the method of noting the manner and places where the blood vessels passed out or entered the optic nerve, paying particular attention to bifurcations or branching of vessels. His work in this field must have been purely theoretical or confined to a few photographs as the arteries are sometimes extremely vague in outline on the photographic plate, and therefore tend to introduce errors and complications.

serve as an index for bifurcation of blood vessels. For many years prior to Haber, Dr Goldstein had used a similar screen to measure the width of blood vessels in certain diseases of the eye by indirect ophthalmoscopy. This device has since been incorporated into ophthalmoscopes. For reasons hereafter mentioned we discarded this method in our present system.

We realize that the meager results of antecedent research in this inviting field

was largely due to lack of equipment, inefficient instruments, and the use of the visual ophthalmoscope for this purpose. At present many of these barriers have been removed by improvements in the retinal camera, by light color filters, and also by photographic plate sensitiveness.

We stated last year that in a modification of the type of protractor first used by us we may obtain a system of angulation and classification which would not of necessity depend on the bifurcation of blood vessels. We are glad to say at this time that we have attained that objective.

The retinal pattern of veins and arteries, normally constant in any given individual, but varying between individuals in an infinite number of details, affords an unambiguous means of personal identification. Confusion as between any two retinal photographs is extremely unlikely, so our problem has never been that of identification itself, once the photographs of a given eye have been brought together. Our problem has been to bring them together, to classify so that we can file and find with certainty. We are therefore here presenting, not so much a system of identification, but one of classification. Given a practical system of classifying, and therefore of filing and finding, identification follows without any real problems.

It became quickly obvious that only a few points in the retinal patterns had to be used for classifying purposes, as even a few variations afforded combinations amounting into the millions. Because of their lighter color blending too well with that of the general retinal background, the arteries did not stand out so boldly as the straighter, darker, and wider veins which photograph with marked contrast. The vein pattern alone is therefore used for classifying, the arteries being ignored.

In arriving at a finally practical system, a number of devices were experimented with and discarded. Various systems and scales of ordinary rectangular coordinates were tried, using points of bifurcation of the veins, or their intersections with lines of the coordinate field, for classifying. We tried out the system of describing points used with topographic maps, dividing the photographic field into nine numbered squares, then subdividing each of these into nine smaller squares, and so on to

any desired degree of precision. We also combined in these tests a 360 degree protractor for measuring the angles taken by the veins. But the same eye, photographed twice, often gave discrepant readings merely because the subject's head had tilted slightly one way or the other between exposures. In other words, we had no means of establishing the true horizontal and vertical for our coordinate system. Even imprinting the coordinate lines on the original photograph during exposure did not avoid this difficulty, but instead added the difficulty of accurate centering while taking the picture.

So, thereafter, we established all our axis of measurement upon the picture itself with reference to obvious points in the photographic field. This eliminated the need for precise centering and leveling during photographic exposure, both unattainable in practice. The center of the papilla or area of entrance of the optic nerve into the retina, which appeared on the photographic negative as a dark circular disk, served as one obvious point for fixing such axis.

Because of its uniform prominence and constant presence, it was decided to select some point in the superior temporal vein as the second point fixing the axis of reference. At first we used its principal point of bifurcation as this axial point, but when cases appeared in which this bifurcation was absent, we chose instead a point in this vein or its most temporal branch ten mm. (on the photographic negative) from the center of the papilla.

This device demanded that the various negatives from a given eye must be magnified to the same degree, otherwise the ten mm. point would fall on the superior temporal vein at varying points in the pattern, thus throwing off the axis of reference and giving variant classification readings. While sharp photographs can be taken with the Zeiss retinal camera at varying magnifications, it provides means for securing uniform magnifications of any given eye. The illumination image must first be focussed sharply on the cornea, then uniform magnification results upon sharp focussing of the retinal field as seen in the eyepiece.

Having fixed the magnification or scale of the picture, but having also discarded

imprinting the coordinate lines (screen) on the original negative, we considered it advisable to imprint a simple scale line when exposing the picture. As the original scale line on the negative has millimeter divisions, the magnification of any subsequent enlargement can be readily determined. On this scale, the letter T indicates the temporal end, the letter N, the nasal. The middle portion of the scale is omitted to avoid confusion with central details of the picture, but this does not impair its use in taking measurements.

By this time it had become apparent that the rectangular coordinate system was not adopted for describing the generally radiating pattern of the veins. Some system of polar coordinates was clearly indicated. The center of the papilla was the obvious center from which the distances, say of bifurcations, could be measured. The axis running from this center and through the point ten mm distant on the superior temporal vein would serve as the zero axis from which angles of points in other veins could be measured.

With this polar coordinate system, it was easy to describe the point of bifurcation of any vein as so many millimeters from the center and so many degrees of angle clockwise or counterclockwise from the zero axis already fixed. But this demanded up to five figures for the description of a single point, one or two for distance from the center and one to three for degrees of angle. The use of many figures promised to be cumbersome.

Besides, we again discovered that bifurcations are not always available, that veins often failed to branch within the field of view. At first we overcame this lack by giving only the angle of a point in the vein ten mm. from the center, then adding the letter X to indicate both the ten mm distance and the lack of bifurcation.

This X device, however, led us shortly to our present simpler system. We ignored the bifurcations altogether, and gave only the angles of the series of points in the several veins and their branches ten mm from the center. In other words, we gave the angles at which veins or branches intersected a circle of ten mm radius, the center of the circle

being of course at the center of the papilla. We also added an inner similarly centered circle of only five mm radius. The first became the Primary Circle and its series of intersection angles the Primary Classification. The second or inner circle was of course the Secondary Circle, and its intersection angles, the Secondary Classification. In coding it, we place the Primary Classification above a horizontal line, and the Secondary Classification below, with the two readings for any given vein one directly above the other. When a vein or branch fails to cross one of the circles, we indicate the lack of intersection by putting an X in place of the missing reading.

In measuring angles, we first used as stated previously, the ordinary degrees, 360 to a circumference. But later we adopted larger angular units, only 100 to the complete circle. One advantage was greater certainty in our readings, for the width of a vein, which may have overlapped several of the ordinary degree graduations (especially of the smaller Secondary Circle), now usually touched but one of the angle graduations. A second advantage was that we could always describe an angle with only two figures instead of the previous three figures. To avoid confusion, we now give every angle in two figures, those from 1 to 9 being given as 01 to 09.

These new units of angle, 100 to a circumference, we have named "centigrades." Tenths of a circumference would then be "decigrades," thousandths, "milligrades," and millionths, "micro-milligrades," a nomenclature thus elaborated now because it may prove useful for other purposes than our own. For such other purposes, angles may be simply written as decimal fractions of a circumference.

To facilitate classification, we have devised a glass or celluloid protractor or angle measurer. Being transparent, it can be laid and fitted over the retinal photograph. The original negatives taken with the Zeiss retinal camera have a field averaging thirty-two mm or about one and one-quarter inches diameter, and the protractor, with outside dimensions somewhat larger, can be made to fit an ordinary fingerprint magnifier. Thus magnified, the adjustment or fitting of the protractor to its proper position on the

44 — 63 — 78 — 85 — 92 — X

Fig 3 The transparent protractor is centered over the optic disk, with arrow point (zero) on the first edge of the superior temporal vein or its furthest left branch (in right eye)
Readings are taken where the last edge of veins cross the classification circles, first around the Primary Circle, then around the Secondary Circle, proceeding counterclockwise, and starting with the first branch encountered of the inferior temporal vein
When a vein or branch ends between the circles, its crossing of the one circle is indicated by the proper reading, and its failure to cross the other by an X (as 00/X above)

photograph, and the subsequent reading of the classification angles, are both easier and more accurate

In practice, the protractor is first centered over the center of the papilla, a small circle and two cross-lines facilitating this operation The protractor is then rotated until a convenient arrowpoint, placed on its zero axis ten mm from its center, touches the superior temporal vein

or its most temporal branch on the photograph There are of course two circles on the protractor, the Primary and the Secondary, each divided into 100 centigrees The classification readings are taken where the veins intersect these circles

It should be noted that the numbering of the centigrees of angle, placed near the outside edge of the protractor, are in

counterclockwise order, reading at the top from right to left. This is merely a convention suited to the fact that in the right eye (which we expect to use, largely if not exclusively) the first angle from our zero axis to an intersecting vein is wider in this direction than in the other. This

wider first angle involves a wider range of variation in our first classification reading, and this is what we are really after, for it means the immediate breaking up of our classification into a large number of divisions with our very first reading. Occasionally, we may have to use a

Fig 4 Individual enlarged pictures showing different vein patterns The T N scale

left eye. In that case, we use the same protractor, but take our readings in clockwise instead of counterclockwise order. This again gives us the wider angle of reading and wider range of classification at the very beginning. Another advantage of this convention is that we can instantly recognize a left retinal classification, for the readings, which in a right classification proceed upward, from lower towards higher numbers, in a left classification proceed downward, starting with high numbers and going on to lower and lower numbers.

For accuracy in reading and consistency in classification, we have adopted additional conventions, as follows:

1. We take our readings at the edges of veins, not at their centers, simply because the edges give us more definite intersections. The edge used is always the first one we come to (before crossing the vein) as we proceed in our readings around the classification circles, counterclockwise for right eyes, clockwise for left eyes.

2. In first adjusting the protractor to the retinal photograph, we also use this first edge of the superior temporal vein or its most temporal branch for fixing our zero axis. In other words, we rotate our protractor until its arrowpoint touches the nasal side of this vein or branch.

3. As we proceed around a classification circle in taking our readings, we always assume the first branch of a vein which we encounter as the main vein, however prominent other branches may appear. The branches encountered later are then considered as mere branches. As they may not cross the Secondary Circle, this convention often determines where we place our X's in our classification.

Our experience with this procedure and these conventions indicates that they meet all conditions found in the retinal pattern and can be applied with consistency. The system has the marked advantages of being simple, its descriptions involve a minimum of figures, and they are filed in purely numerical order. It can be mastered for practical use in a couple of hours. The range of classifications, determined by the number of combinations of possible variations, runs into millions

when two classification circles are used.

We desire to thank Inspector C. C. Carmody of the Detroit Police Department who early recognized the value of retinal identification and who enlisted the services of Dr. Samuel J. Rubley, an ophthalmologist, to further delve into this subject. He opened up to Dr. Rubley the use of his photographic and technical equipment. We have during the past year been in almost constant communication with Dr. Rubley who has devoted a great deal of time to various phases of research. He has succeeded in taking photographs through pathological opacities of the eyes through the aid of red sensitive plates and a Wratten filter. He has also taken a large number of normal retinal pictures. In association with Dr. C. H. Brugher of the Pathological Staff of the University of Michigan he has also contributed valuable information in the technique of postmortem retinal photography.

Conclusion

We feel that we have completed a practicable workable system of classification of a method of personal identification which has at least one advantage over any other method, in that it cannot be changed or tampered with. We never contemplated that it should ever replace skin ridge identification which has only one possible defect but many other advantages over all other methods. We were of the opinion, to which we still adhere, that retinal identification was a valuable adjunct to fingerprint identification in certain cases and emergencies. Whatever service to criminal science our contribution may render only time will disclose. We feel amply repaid for the amount of energy expended and time devoted to this work. We feel that our results have justified our hopes and leave whatever we have accomplished as footprints for others to follow.

SYPHILIS IN PREGNANCY

SAMUEL S. PALEY, M.D., *New York City*

Physician-in-Charge, Social Hygiene Clinic, Central Harlem Health Center, Associate Visiting Physician Harlem Hospital

There can be no doubt that the problem of syphilis in the pregnant woman constitutes a serious public menace and health problem. This is especially true of syphilis in the Negro because of its greater prevalence in that race.

Many studies¹⁻⁵ have already been made dealing with the subject of syphilis in pregnancy. Most of these studies have been made in the southern part of the United States, and it is of interest to report on a similar group of pregnant syphilitic women residing in New York City where conditions of sanitation and the standard of living are probably better than in the southern states.

The occurrence of syphilis among the Negro population of New York is considerably higher than it is among the white population. This disparity also exists with regard to syphilis in pregnancy reaching a point of five to ten per cent among the white population and fifteen to thirty-four per cent among the Negro population. The incidence of syphilis among pregnant Negro women in the prenatal clinics of the Central Harlem Health Center District is 11.4 per cent of 1,402 women examined in the period from 1933 to 1936.

This study deals with a series of 617 pregnant women suffering from syphilis in its various stages who were observed and treated over a period of six years from 1930 to 1936. Inasmuch as the history was found to be extremely unreliable as a means of diagnosing the disease, dependence was placed principally on the serologic tests as well as on such clinical manifestations as were evident on examination. The age of the patients varied from fifteen to forty years, and ninety-five per cent of them were Negroes. In all these cases the result of the pregnancy was known and all living children were observed over a period of years during

which time repeated physical examinations and Wassermann tests were made. The effects of syphilis and of antisyphilitic therapy were, of course, determined by the outcome of the pregnancy. All living babies were examined and Wassermann tests were taken when the child was one month old. These examinations were repeated at intervals of three months if the original examinations showed no evidence of syphilis. The babies with syphilis were placed under treatment. The diagnosis of syphilis was made almost entirely on the Wassermann test, inasmuch as clinical manifestations of syphilis were infrequent in this group of cases, being present in only one per cent of all the babies examined and in five per cent of the babies with syphilis.

All abortions, miscarriages, still-births, and death in babies under two months of age born of these syphilitic women were considered presumably due to the syphilitic infection. These cases were grouped with the cases with positive Wassermann tests under the heading of syphilitic tragedies.

It was decided to analyze the results of our study from two principal standpoints, *first*, with regard to the duration of the infection in the syphilitic mother, *secondly*, with regard to the amount of antisyphilitic treatment received by the mother during the current pregnancy.

With reference to the duration of the infection, the cases were divided into three groups, (1) Infection less than two years' duration, (2) two to five years' duration, and (3) over five years' duration.

The duration of the infection was determined principally by a history of primary or secondary manifestations, by positive Wassermann tests, and by the marital history. There was only one case of proven congenital syphilis in the mother, and this case was included in

*From the Service of the Social Hygiene Clinic, Central Harlem Health Center,
New York City Department of Health*

those with duration over five years. Incidentally, the baby born of this mother whose therapy during pregnancy consisted of five injections of neoarsphenamine and five injections of bismuth showed no clinical evidence of syphilis as well as a negative Wassermann reaction.

With reference to the amount of treatment received during pregnancy the cases were again divided into three groups (1) Those receiving less than four injections of neoarsphenamine plus bismuth, (2) four to seven injections of neoarsphenamine plus bismuth, (3) eight or more injections of neoarsphenamine plus bismuth.

abortions, miscarriages, still-births, and deaths under two months make up an alarming total of twenty-eight per cent syphilitic tragedies.

It is interesting and important to note that the group of cases which received some antisyphilitic therapy prior to this pregnancy shows much better results in this current pregnancy. There were less than eight per cent syphilitic babies in this group and only 21.74 per cent total syphilitic tragedies as compared with 17.13 per cent syphilitic babies and 29.49 per cent total syphilitic tragedies in the group which had never before received any antisyphilitic therapy.

TABLE I—ANALYSIS OF OUTCOME OF PREGNANCY

All cases without regard for duration of syphilis in the mother or amount of treatment administered during pregnancy

	Total cases	*Previous treatment	No previous treatment	Primipara	Multipara
Total	617	115	502	175	442
Nonsyphilitic living babies	444 71.96%	90 78.26%	354 70.51%	105 60.00%	339 76.69%
Living babies with syphilis	95 15.39%	9 7.82%	86 17.13%	43 24.57%	52 11.76%
Died before birth	43 6.97%	7 6.08%	36 7.17%	18 10.28%	25 5.65%
Died less than two months	35 5.67%	9 7.82%	26 5.17%	9 5.15%	26 5.85%
Syphilitic tragedies	173 28.04%	25 21.74%	148 29.49%	70 40.00%	103 23.31%

* This includes cases which have received 6 or more injections of neoarsphenamine plus bismuth prior to the current pregnancy.

The therapeutic procedure followed in this clinic consisted of continuous treatment during the entire period of pregnancy with weekly injections of both neoarsphenamine in doses from 0.1 to 0.3 gm and bismuth salicylate in oil in doses from 0.1 to 0.2 gm. Because of the fact that bismuth was given concurrently with neoarsphenamine, it was deemed advisable to limit the dosage of neoarsphenamine to 0.3 gms.

The following other factors were also considered in the analysis of the cases:

1. The trimester of pregnancy in which the patient presented herself for treatment.
2. Whether she had received any antisyphilitic treatment prior to this pregnancy.
3. Whether she was a primipara or a multipara.
4. Whether the father was also syphilitic.
5. Subsequent pregnancies in the same cases during the five years of observation were also studied and the results of these pregnancies analyzed.

Table I indicates very clearly the terrible toll that syphilis takes in pregnancy. Over fifteen per cent of the babies were born with syphilis. The number of

The difference in the results in primipara and multipara is also striking. However, this is only an apparent difference as will be shown subsequently because 113 out of a total of 175 primipara or sixty-five per cent were in the group of cases in which the duration of the syphilitic infection was less than two years.

Table II demonstrates the importance of antisyphilitic therapy in syphilis in pregnancy. Even a moderate amount of treatment increases the percentage of nonsyphilitic babies from 53.74 to 77.62 per cent, and an adequate amount of treatment increases the percentage of nonsyphilitic babies to eighty-six per cent, an increase of thirty-three per cent over those in the inadequate treatment group. Similarly the percentage of babies with syphilis declines from twenty-one per cent to 7.7 per cent and the total syphilitic tragedies from forty-six to 13.9 per cent. This demonstrates very strikingly the value of adequate antisyphilitic therapy in pregnancy.

Tables III-A, B show the tremendous incidence of syphilis among babies born of mothers in whom the duration of the

syphilitic infection was less than two years. Over thirty-seven per cent of the babies in this category were born with syphilis, and the total syphilitic tragedies were over fifty per cent.

Analysis of this group with regard to treatment shows how extremely important antisyphilitic therapy is in these early cases of syphilis. In the cases which received very little or no treatment the incidence of syphilitic babies was 42.5 per cent and the incidence of syphilitic tragedies reached a staggering total of 76.6 per cent. With a small amount of treatment the total of syphilitic tragedies was reduced to 48.9 per cent and with more adequate treatment this was further reduced to 23.8 per cent—over a fifty-three per cent reduction. It is to be noted that with a moderate amount of treatment the marked reduction in the total syphilitic tragedies was produced by the effected reduction in miscarriages, still-births, and deaths under two months of age, whereas with more adequate therapy the improvement was also noted in the number of babies born with syphilis, namely a reduction from 42.5 to 23.8 per cent.

Table IV-A demonstrates that the older the infection is in the mother, the less likely it is that the baby will be syphilitic. However, in this two to five year group the occurrence of syphilis in the baby is still considerable, amounting to 13.87 per cent living babies with syphilis and a total of 25.44 per cent syphilitic tragedies.

Table IV-B demonstrates that antisyphilitic therapy is also extremely important in this group of cases with infection from two to five years. Increasing amounts of antisyphilitic therapy reduced the number of living syphilitic babies from

17.2 to 8.6 per cent and the total syphilitic tragedies from 36.2 to 18 per cent.

These figures show that antisyphilitic treatment should be administered in this group of cases with the duration of the syphilitic infection from two to five years.

TABLE III—EFFECT OF DURATION OF SYPHILIS IN THE PREGNANT MOTHER

This demonstrates very strikingly the value of adequate antisyphilitic therapy in pregnancy.

Tables III-A, B show the tremendous incidence of syphilis among babies born of mothers in whom the duration of the

visible to analyze our results not from the standpoint of the period of pregnancy during which the patient was admitted for treatment, but from the total amount of antisyphilitic therapy administered during pregnancy. The figures show that a small amount of therapy is more effective early in pregnancy than late, and that the incidence of living syphilitic babies increases from 2.44 per cent in cases admitted during the first trimester of pregnancy to 19.75 per cent in cases admitted in the last trimester.

with living syphilitic babies. In all three of these cases the mothers had been suffering from a recent syphilitic infection during the first pregnancy. As a matter of fact, two of these women had appeared for treatment late in the first pregnancy with active secondary syphilis and had received totally inadequate treatment at that time. The total syphilitic tragedies were reduced from 28.26 in the first pregnancy to 11.94 per cent in the second pregnancy.

There were sixteen cases with three

TABLE VIII

Analysis of cases with two or more pregnancies while under treatment from 1930 to 1936

A									
	First Pregnancy			Second		Third		Fourth	
Total	92			92		16		2

B									
ANALYSIS OF SECOND PREGNANCY									
	First pregnancy nonsyphilitic			First pregnancy with syphilis					
Total	66			17					
Nonsyphilitic living babies	61	92	42%	15	88	24%			
Living babies with syphilis	0	0		1	5	88%			
Died before birth	4	6	06%	0	0				
Less than two months	1	1	51%	1	5	88%			
Syphilitic tragedies	5	7	57%	2	11	76%			

Table VII shows that syphilis in the father as well as in the mother had a definite effect on the outcome of pregnancy. It also demonstrates that it is important that both parents receive antisyphilitic therapy in order to reduce the incidence of syphilis in the baby.

The reason for the disparity in Table VII is probably explained by the fact that where the father was also syphilitic the duration of syphilis in the mother was shorter, and hence the incidence of syphilitic babies and syphilitic tragedies was greater in that particular group of cases.

Ninety-two of the 617 cases under observation had a second pregnancy while they were still under treatment (Table VIII). The results of these second pregnancies demonstrate again the effectiveness of antisyphilitic therapy. Eighty-one or 88.04 per cent of these cases resulted in living nonsyphilitic babies. There were only three cases or 3.26 per cent

pregnancies while under treatment. Fourteen or 87.5 per cent resulted in living non-syphilitic children. Of the remaining two cases one was still-born and the second died at the age of one month.

The two cases with a fourth pregnancy while under treatment both resulted in normal nonsyphilitic babies.

Summary

1. 617 pregnant women all suffering from syphilis in its various stages were treated with neoarsphenamine and bismuth during pregnancy. Ninety-five per cent of the women were Negroes.

2. The outcome of each of these pregnancies was known, and all living babies were followed for a period of from two to five years and examined physically and serologically every three months.

3. The effects of antisyphilitic therapy on the outcome of the pregnancy was de-

Table V-A confirms the fact that as the syphilitic infection in the mother increases in duration the possibility of infection of the baby with syphilis becomes less likely. However, even in this group of cases when the duration of syphilis in the mother is over five years there is still an incidence of 19.28 per cent syphilitic tragedies, including 6.2 per cent living babies with syphilis.

It is interesting to note in Table V-B that antisyphilitic treatment is effective even in this late syphilitic group. In the cases with little or no treatment the percentage of living babies with syphilis was 13.7 per cent and this was reduced by moderate treatment to 3.85 per cent, in the cases with more adequate treatment

there were no cases of living syphilitic babies out of a total of ninety-three cases. Similarly the total number of syphilitic tragedies was reduced from 38.5 to an almost negligible 6.45 per cent.

The analysis of cases with respect to duration of syphilis in the mother and the amount of antisyphilitic therapy received during pregnancy demonstrates very clearly the importance of treating all pregnant syphilitic women regardless of the duration of their infection. It is also conclusively shown that the amount of treatment is also extremely important. The more treatment received by the pregnant syphilitic mother the fewer were the syphilitic babies and syphilitic tragedies. These tables also show that even a few injections of nearsphenamine and bismuth increase the possibilities of the babies being born alive and free from syphilis.

TABLE V

C Cases with syphilitic infection over five years duration (See Tables III-IV)

	A			Primipara			Multipara

Living babies with syphilis	1	2	44%	29	11	88%	65	19	57%
Died before birth	8	19	51%	17	6	96%	18	5	42%
Died less than two months	1	2	44%	13	5	28%	21	6	32%
Syphilitic tragedies	10	24	39%	59	24	19%	104	31	33%

Primipara and Multipara

Tables III-A, IV-A, and V-A show that the only reason that the incidence of syphilitic babies and syphilitic tragedies is apparently greater in the primipara is because the duration of the syphilitic infection is more apt to be much shorter in the primipara than in the multipara.

Table VI is merely supplementary to the tables analyzing the outcome of the pregnancy with reference to the amount of antisyphilitic therapy received. Naturally if treatment is begun early in pregnancy the patient will receive more treatment during pregnancy and the results will be much better than when therapy is begun later. However, the mere fact that a patient was admitted for treatment early in her pregnancy does not imply that she received adequate treatment because of the fact that many of these cases were delinquent and did not report regularly for treatment. It is, therefore, more ad-

TABLE VII—EFFECT OF SYPHILIS IN THE FATHER

	Syphilitic father			Nonsyphilitic father		
	88			143		
Total	63	71	59%	116	81	12%
Nonsyphilitic babies	14	15	91%	16	11	19%
Babies with syphilis	7	7	95%	8	5	6%
Died before birth						
Died less than two months old	4	4	55%	3	2	09%
Syphilitic tragedies	25	28	41%	27	18	88%

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital. The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Krimhilda

There are many reasons why an "only child" in a family is usually spoiled, that is, treated with over-attention, as if it were the center of humanity, the source of all light. But it is not true, as some educators claim, that this must necessarily happen to every only child. Parents who know their job will not make that mistake and those who bungle it will bring up the tenth child as horribly as they do in the case of the only one.

But Krimhilda was an only child and had been spoiled, that is she had been both pampered and treated with cruelty, seemingly opposite actions that always go together. While her every whim and wish for the most unreasonable things were, as a rule, quickly and fully satisfied, she would, often enough, tire her elders' patience so that they would punish her brutally for demanding something that she was entitled to and was easy to get. Of course, she was the tyrant of the family and, with some tears or shuffling of the feet, she would finally obtain whatever she desired.

That such upbringing was preparing her badly for life, these foolish and selfish parents had no idea. Nor could they dream that they were her worst enemies.

They were German-Americans and they believed in the greatness of everything that was German. Hence the child's given name, taken from the *Nibelungenlied* long before the "back to paganism" movement (It had to be spelled Kriemhilde or the pedantic father would protest.) Every one of her childish qualities was overrated—all children have some, mostly temporary, talents—and these parents expected her to be the greatest person on earth. All through her childhood they were blind and stubborn. Nothing daunted, they implicitly believed in her and were sure she would conquer yet and be recognized in the end. For long and tedious years and at a great sacrifice to her father, whose business was all but ruined, she studied music and singing—unsuccessfully. She was just as mediocre in drawing and painting and had to accept the passing marks in high school. Much was made of her "poetry" at the age of ten, but it turned out to be ludicrous

in her adolescent years. She was a complete failure, a real *ratée*. Much later, after their disillusionment, even the parents lamented that she amounted to "nothing" because she grew up to be an average girl.

But while they were still hoping for some miracle to happen, Krimhilda, whose eyes were partly and temporarily opened by rude life, began to understand the situation and to attempt to remove the great obstacle which had been thrown in her way. Although still groping in the darkness she did her best to become financially independent. She studied psychology and thought herself ready to function as a full-fledged psychologist. But, alas, her mind was ill-prepared for that. Nor was she, fortunately, able to find employment.

That was the time when I first met her. She had come to the International Congress on Mental Hygiene held in Washington in 1930, where I functioned as a scientific interpreter. She described her case both as a patient and as a candidate for a job and pleaded for help. But psychology was clearly a bad vehicle for her *psychoneurotic* personality and the Congress with its thousands of participants and its suggestive subjects could only harm her. My recommendations brought no permanent relief. She was not able to work, and sorely disappointed, she went back to live and quarrel with her parents, in the atmosphere which she abominated.

Then her real problem began—she suffered from *insomnia*.

There is *insomnia* and "insomnia." Her condition, at the outset, was of the latter type. Not that she slept in snatches without knowing it or without admitting it, as many do. But she deliberately made the greatest effort *not* to sleep. She loved to pose before herself as a very unfortunate person and make believe that she dreamed that some knight from the fable would come and rescue her. In the course of time she succeeded in not falling asleep even when she wanted to—then there was real *insomnia*. Bye and bye her night thoughts became more and more populated with sexual scenes. Then, all she did during her sleepless nights was to paint to herself all sorts of

area has a population of 738,975. Half a million people live within a radius of a mile's ride to Rochester's Main Street stores.

Rochester's industrial area has 1052 manufacturing establishments, each of which has an annual output of more than \$5,000 per year. With a capital investment of \$350,000,000, annual output of \$435,000,000. More than 180,000 are employed. The salaries paid in this area are \$32,328,510 and wages of \$88,898,053. Rochester proper has 935 industries with 11,458 officers and office employees paid salaries of \$31,088,460, and

wages of \$82,416,463.

It is estimated that there are approximately 380,000 employed within a fifty mile radius.

Rochester is a livable city, and possesses many characteristics conducive to the well being of the individual. The spirit of progress in Rochester is exemplified in civic affairs as well as in industrial developments. Rochester occupies a strong position among the cities in its class, and in friendly, hospitable spirit stands second to none. America has no better example of a progressive, loyal, happy community.

ROCHESTER BIDS YOU WELCOME!

A DOCTOR SUES THE PHONE COMPANY

Dr. H. D. Eichacker, maternity specialist, who lives and has offices in Ridgewood, Queens, has filed suit against the New York Telephone Company in Queens Municipal Court to recover \$190 which, he alleges, is owed to him for overcharges since 1923, says the New York *Herald Tribune*. He contends that he was billed for having a commercial telephone, whereas he should have been charged for a residential telephone, which is cheaper.

In his action, Dr. Eichacker said, he had the full support of more than 1,000 members of the Queens Medical Society, many of whom also have offices at their homes. His counsel is E. F. W. Wildermuth, of Forest Hills, Queens.

"Some time ago I read an article in the

American Medical Magazine relating to telephone charges of physicians," he explained yesterday. "I then realized I had been charged for a commercial telephone, whereas I should have been charged only for a private residence phone. I investigated and found that in 1923 the Public Service Commission had given a decision which upheld the contention that such a phone as mine was a private phone."

"I happened to look at the listing of my phone in the telephone directory and I found that after my name they had inserted the abbreviation 'off'. Now that was done without my knowledge or consent. There had never been any change in the contract. I had with the company, so as far as I was concerned there was no authorization for this altered designation."

A WOMEN'S FIELD ARMY

Under the above designation a movement is underway to start a membership drive to enroll at least 50,000 women soldiers in the New York division of the national organization to fight cancer. One of the main purposes of the army is to have organizations in the states throughout the country in order to establish the importance of state activities in the effort to control cancer. Miss Harriet W. Mayer is State Commander of the New York division of the army.

In an address before a conference of the Women's Field Army, Dr. Frank E. Adair, Secretary to the American Society for the Control of Cancer, gave an address which placed the facts relating to the incidence

of cancer among women showing that one of every eight women reaching the age of forty years may be expected to die of cancer under existing conditions.

As offsetting these unpleasant facts, he felt hopeful of great progress in the saving of life through education, explaining that under present conditions twenty-five per cent of women with cancer did the correct thing as ordered by doctors. Another twenty-five per cent do not follow doctor's advice. Twenty-five per cent never go to the doctor until it is too late and about twenty-five per cent are advised wrongly by doctors. These figures show the great importance of an educational campaign by women.

NUTRITIONAL REVIEWS I.**Protein Requirements**

HERBERT POLLACK, M D and HENRY DOLGER, M D, *New York City*
From the Metabolic Clinic of Dr H Lande and the Med Service of Dr G Bachr
Mt Sinai Hospital

The field of nutrition has never been subjected to so much misrepresentation as during the present period of economic stress. The distortion of facts by prejudice and sentiment has often served to obscure the fundamental knowledge which scientific investigators have produced. In the matter of protein requirements this disregard for readily available data has been especially flagrant. Viewing the wide range of protein consumption by the various peoples on the earth, from the almost exclusive meat diet of the Arctic inhabitants to the extremely low protein intake of the Orient (less than 10% of the total caloric intake) it must be evident that the standards for minimum protein requirements should again be brought to the attention of all.

Proteins are defined as nitrogen containing foodstuffs, and are found widely distributed in all foods, varying in concentration from a minimum of two per cent in the leafy vegetables to a maximum of thirty per cent in dried meats and fish. It is significant to point out that certain commonly used leguminous vegetables contain as much as, or even more protein than meat, namely soybean meal thirty-seven per cent, dried navy bean 22.5 per cent, dried lima beans eighteen per cent, dried peas twenty-five per cent. Other common foods rich in proteins include cheese twenty-eight per cent, macaroni thirteen per cent, peanut butter twenty-nine per cent, and whole wheat bread ten per cent. With such varied items it becomes obvious that it is

virtually impossible for the average individual to avoid consuming an adequate amount of protein. It must be remembered in addition to the total protein requirements there are certain specific amino-acids which are essential for growth and the maintenance of body vigor, namely tryptophane, tyrosine, lysine, and cystine, and these have been shown to be widely distributed in nature. Osborne¹ stated, "On chemical grounds, there is no more reason for dividing proteins into two groups of animal and vegetable proteins, than there is for making a similar distinction between carbohydrates."

Carl Voit² in 1881 first established the average diet as containing 118 grams of protein daily. This figure was arrived at by the statistical method which simply showed what the average worker consumed by habit. Similarly the standards set up by Rubner and by Atwater were based on consumption, and not on actual physiological protein requirements. Siven³ in 1901 was first to determine experimentally the minimum protein requirements, and he obtained nitrogen equilibrium on twenty-five-thirty-one grams of protein with 2700 calories. Chittenden⁴ in 1904, working with a group of active soldiers and athletes, was able to maintain nitrogen equilibrium with diets containing forty grams of protein, one-third of the old standard. Today, his then radical suggestion of sixty grams of protein as being adequate, is accepted universally.

NUTRITIONAL REVIEWS I**Protein Requirements**

HERBERT POLLACK, M D and HENRY DOLGER, M D, *New York City*
From the Metabolic Clinic of Dr H Lande and the Med Service of Dr G Baehr
Mt Sinai Hospital

The field of nutrition has never been subjected to so much misrepresentation as during the present period of economic stress. The distortion of facts by prejudice and sentiment has often served to obscure the fundamental knowledge which scientific investigators have produced. In the matter of protein requirements this disregard for readily available data has been especially flagrant. Viewing the wide range of protein consumption by the various peoples on the earth, from the almost exclusive meat diet of the Arctic inhabitants to the extremely low protein intake of the Orient (less than 10% of the total caloric intake) it must be evident that the standards for minimum protein requirements should again be brought to the attention of all.

Proteins are defined as nitrogen containing foodstuffs, and are found widely distributed in all foods, varying in concentration from a minimum of two per cent in the leafy vegetables to a maximum of thirty per cent in dried meats and fish. It is significant to point out that certain commonly used leguminous vegetables contain as much as, or even more protein than meat, namely soybean meal thirty-seven per cent, dried navy bean 22.5 per cent, dried lima beans eighteen per cent, dried peas twenty-five per cent. Other common foods rich in proteins include cheese twenty-eight per cent, macaroni thirteen per cent, peanut butter twenty-nine per cent, and whole wheat bread ten per cent. With such varied items it becomes obvious that it is

virtually impossible for the average individual to avoid consuming an adequate amount of protein. It must be remembered in addition to the total protein requirements there are certain specific amino-acids which are essential for growth and the maintenance of body vigor, namely tryptophane, tryosine, lysine, and cystine, and these have been shown to be widely distributed in nature. Osborne¹ stated, "On chemical grounds, there is no more reason for dividing proteins into two groups of animal and vegetable proteins, than there is for making a similar distinction between carbohydrates."

Carl Voit² in 1881 first established the average diet as containing 118 grams of protein daily. This figure was arrived at by the statistical method which simply showed what the average worker consumed by habit. Similarly the standards set up by Rubner and by Atwater were based on consumption, and not on actual physiological protein requirements. Siven³ in 1901 was first to determine experimentally the minimum protein requirements, and he obtained nitrogen equilibrium on twenty-five-thirty-one grams of protein with 2700 calories. Chittenden⁴ in 1904, working with a group of active soldiers and athletes, was able to maintain nitrogen equilibrium with diets containing forty grams of protein, one-third of the old standard. Today, his then radical suggestion of sixty grams of protein as being adequate, is accepted universally.

The Great War with its resultant dietary restrictions in the blockaded countries, afforded considerable reliable information as to the dietary requirements of various groups. The concept of adequate protein requirements at this time underwent an even further radical curtailment. The German people are reported to have ingested an average of thirty grams of protein daily throughout the war. Yet, Von Muller⁵ observed that all symptoms of protein deficiency, including "hunger edema" and anemia disappeared entirely in 1917 when a good potato crop assured an increased carbo-

hydrate and fat. The subject was maintained in nitrogen equilibrium with less than ten grams of protein daily. These facts were obtained from well-controlled laboratory and clinical observations substantiated from several sources. Similar figures were obtained independently by Smith,¹⁰ Rabe and Plaut,¹¹ Thomas,¹² and others.

Since one of the functions of an adequate diet is to maintain an economically efficient individual, it is significant to point out that mechanical efficiency is greatest with a high carbohydrate diet. The basis for this statement rests on the observation that the caloric expenditure from the specific dynamic action of protein cannot be utilized as energy for work. In contradistinction to this, the specific dynamic action of carbohydrate and fat can be utilized for work metabolism. The fact that the nonutilizable specific dynamic action of protein is about thirty per cent while that of carbohydrate and fat about five per cent, makes the caloric waste of protein more apparent. Athletic coaches and trainers have gained this knowledge from empirical observations. Experimental proof has been available for this dictum since 1866 when Pettenkofer and Voit¹³ published their now universally quoted experiment, summarized in the accompanying table.

This shows a sixty-three per cent increase in heat loss when work is done following a protein meal.

Having shown that the ingestion of protein decreases work efficiency, it can further be shown that musculature activity is independent of protein metabolism. Cathcart, Kennaway, and Leathe¹⁴ (1906) and Shaffer¹⁵ (1908) could demonstrate no increase in nitrogen excretion following short and long periods of intense work.

Certainly, Lusk,¹⁶ the outstanding American investigator, recognized these facts when he stated that, "it may be said that carbohydrates are the most economical of foodstuffs, both physiologically and financially. They are the greatest spacers of protein." He felt that mechanical work should be accomplished at the expense of carbohydrates and fats and not of the proteins, which should be required simply for wear and tear meta-

TABLE I

	Cals	% increase increased heat	Heat due to work
1 No food, rest	1976		
2 600 grams cane sugar, rest	2023	2.4	
3 600 grams cane sugar, rest	2868	45.2	845 cals
4 Protein, large amount, rest	2515	27.2	
5 Protein, large amount work	3370	70.5	855 cals

hydrate intake. Here the protein sparing action of carbohydrates became obvious on a grand scale.

Experimentally Rubner⁶ was able to confirm this observation and maintained nitrogen equilibrium with thirty-three grams of protein as long as the total calories equaled 2000 daily. He found that the addition of 500 calories in the form of sucrose to the official rations (1600 calories) was sufficient to maintain not only nitrogen equilibrium but also body weight. For a period of thirty-five years, Hinhede⁷ was able to maintain nitrogen equilibrium with sense of well-being and objective good health with only twenty-five grams of protein daily.

In acute experiments these figures were lowered still further. Petren⁸ was able to maintain nitrogen equilibrium with twenty grams of protein on a 1300 calorie diet in several patients. The lowest figures ever obtained to date were those of Duel, Saniford, and Boothby.⁹ In a really classically designed series of experiments, these investigators showed that the nitrogen excretion is inversely proportional to the caloric intake from

bolism Bayliss,¹⁷ the English physiologist, made the pertinent remark "Take care of the calories and the protein will take care of itself" A high protein diet

is a luxury and in times of economic stress is an unnecessary indulgence

WE ARE RUNNING ON LOW BRAIN POWER

The human brain, in spite of the fact that it has been evolving for millions of years, is still far from a finished product, and its future development holds out the bright promise of vastly increased brain power with which mankind may assail its difficulties, Dr Frederick Tilney, one of the foremost authorities on the evolution of the brain, declared in a paper presented before 1,000 persons at the New York Academy of Medicine on Feb 11

Dr Tilney, who is Professor of Neurology at the College of Physicians and Surgeons, Columbia University, traced the evolution of the brain and estimated that it is now about a quarter finished and therefore "in its early youth"

"By most of us the human brain is regarded as a finished product," Dr Tilney said. "Its long prehistoric record as we know it today, does not support this point of view. On the contrary, it makes it appear far more likely that the brain of modern man is only at some intermediate stage in the ultimate development of the master organ of life

"The brain element in which the greatest development has occurred is the frontal lobe. Its growth conveys an accurate impression of the manner in which the brain has responded to the demands made upon it. These demands continue to be made. The fact seems to point in a hopeful direction"

Palaeontological researches demonstrate the gradual expansion of brain power through the ages, a fact of "an inspiring significance," Dr Tilney continued

"It is possible to sense the irresistible force that has carried animal life onward and upward through the ages," he said "This force may be and probably still is at work. It may still carry us upward

"This viewpoint should make an urgent appeal for thoughtful consideration. In it are many suggestions concerning further human advancement as well as many possibilities for improvements and readjustments in human relations and behavior"

Dr Tilney explained that there have been periods in human history when the development of the brain appeared to have stood still and "perhaps even fallen behind" This apparent brake on its development is due to the "manifest lack of control over human nature," he argued

"Thus far, the human race has always managed to come back and go forward again after each of its self-inflicted catastrophes," he said. The dawn history of man was followed by a procession of great events which began in the early Egyptian dynasties and continued through the glories of Greece and the Roman Empire. Each of these civilizations contributed to the development of the human race

"This is an inspiring picture of almost uninterrupted human progress

"It might be easily questioned how many human brains actually reach full maturity," he said. "Many reasons stand in the way of full development, such as physical, social, educational or economic handicaps. It is doubtful whether the average human being ever develops more than a quarter of the brain's potential power"

Schenectady is again on the honor roll of cities having no fatal motor accidents in

the four weeks ending on Feb 13. Yonkers had only one

DIABETES MELLITUS

Factors Influencing Cause, Course, and Complications Analysis of 88 Cases

ESTHER TUTTLE, M D , *New York City*

Diabetes mellitus is recognized as being on an increase, and a definite knowledge of its cause is as yet an unknown factor

This study was made to determine (1) Influence of heredity on the incidence and course of the disease (2) Relation, if any, to age incidence (3) Part played by endocrine imbalance (4) Possible relation between gall-bladder disease, pregnancy, and diabetes mellitus (5) Complications resulting from hyperglycemia and hypercholesteremia (6) Effects of dehydration due to continued glycosuria (7) Effects of repeated insulin reactions on the arterial system

Influence of Heredity on Incidence and Course

Heredity appears as a factor in the incidence of the disease. In the group studied, 33.3 per cent definitely showed hereditary origin, 35.7 per cent showed no indication of hereditary origin, while thirty-one per cent were unknown. Of this last group, many of the children were of foreign birth, who knew little about their antecedents, and it is therefore safe to assume that in many of these cases the question of heredity would be definite. The analysis of these histories agrees with the opinion of other investigators that diabetes mellitus is an inherited disease.

Howard and Cammidge,¹ (1926) through their laboratory studies, showed that a tendency to high blood sugar can be transmitted in mice and in other animals according to the Mendelian law.

Van Noorden has pointed out the desirability of seeking information from diabetic patients not only of diabetic heredity, but hereditary incidences of other endocrine disturbances. He suggests that an inheritance of metabolic inferiority may strike at one organ in one individual and another in the next of kin. Wilder² states that figures for

heredity are doubled when the inquiry covers endocrine and metabolic conditions.

Further viewpoint of hereditary tendencies of diabetes mellitus is confirmed by Joslin.³ He states that the influence of heredity took on greater significance when children demonstrated that obesity was not a causal factor in diabetes and that forty-nine per cent of the first one hundred children with diabetes of ten years' duration have diabetic relatives.

The incidence of diabetic heredity has also been discussed by Priscilla White.⁴ She finds diabetic heredity increasing in adults. Out of one hundred adults, when first seen, diabetic heredity was twenty-nine per cent, but when seen five years later, additional relatives had appeared in the group, raising the percentage to thirty-seven per cent. If lives of patients are prolonged, the influence of heredity would be manifested more and more.

It is now the accepted theory that hereditary diabetes follows the Mendelian recessive pattern. Priscilla White from her studies concludes that diabetes is inherited as a Mendelian recessive based on the following:

- 1 Finding of greater evidence of diabetes in a diabetic than in a control population selected at random.

- 2 Demonstration that Mendelian law applied to a large series of case histories selected at random.

- 3 Check on case history by direct examination of blood urine of a small series of families diabetic and control.

If this be so, it gives hope that control of diabetes is possible. For if a diabetic marries a diabetic all the children are predestined diabetics. If a diabetic marries a carrier, one-half of the children are predestined to diabetes. If a carrier marries a carrier, only one-fourth are predestined to diabetes, but

if a diabetic marries a pure nondiabetic none of the children are predestined

Thus it would follow for proper control we must train our diabetic children to marry into pure nondiabetic families. We shall also carry these teachings to the children of diabetic parents because they are insidious carriers of the disease.

Age Incidence

In the series studied the average age of the males were 44.9 and the female 56.6 years. Ten per cent of the cases were below thirty and had diabetes mellitus at least ten years. Our analysis indicates, from a study of these cases, that the disease in the adult was of a milder type than that of a younger group. It was also found that a greater amount of insulin was required to control the disease in the younger group than in the older. Furthermore, in this young group, the blood sugar levels before the control of the disease were considerably higher than in the older group and subject to more marked variations.

Endocrine Imbalance as Contributory Factor

More advanced and recent studies of diabetes leads students of this disease to concur that diabetes is a disease of the metabolism not only involving chemical abnormalities of the body fluids, but also includes disturbances of the glands of internal secretion, which affect the metabolic processes and disorders of nutrition. Through rapid advancement in the knowledge of the physiology of the anterior pituitary gland, this gland plays an important part in carbohydrate metabolism and diabetes.

Lyll and Innes,⁵ in their researches, state that little clinical evidence seems to exist concerning the effect of pituitary activity on carbohydrate metabolism in general and on disturbed sugar metabolism of diabetes in particular. However, much experimental evidence is accumulating.

The demonstration of Houssay and associates⁶ is considered a classic in this respect. After removing the pituitary body from frogs and dogs, the removal

of the pancreas was not followed by the usual degree of diabetes. Some of the depancreatized animals showed no glycosuria and no hyperglycemia.

Great importance of the pituitary gland in relation to carbohydrate metabolism is recognized since the publication by Houssay and his collaborators of their experiments on the effect of removal of the hypophysis on pancreatic diabetes of frogs and dogs.

This work demonstrates that the principle symptoms of pancreatic diabetes namely, glycosuria, hyperglycemia, and acidosis were considerably ameliorated when the hypophysis was removed from totally pancreatectomized animals.

Houssay's work was confirmed by others, Barnes and Regan,⁷ also Kutz and his associates.⁸ The work of Lucke together with the others indicated the presence of a blood sugar raising factor in extracts of anterior lobe of the pituitary body. Lucke preferred to call this factor "contra-insular hormone." The preparation which he used—"praephyson," a blood sugar raising extract of the anterior lobe of the pituitary body—was injected into normal dogs and elevated the blood sugar. He injected diabetic dogs and caused a marked increase in blood sugar, when given to dogs that had pancreatic diabetes, it caused marked increase of blood sugar and when given to dogs with pancreatic diabetes treated with insulin, it produced hyperglycemia and increased the total secretion of dextrose. This substance, therefore, has the effect of an anti-insulin, for it prevented the insulin from lowering the blood sugar.

In the regulation of the blood sugar level, the liver with its store of glycogen occupies an important position. The pituitary hormone might reach the liver by way of the blood, either directly or indirectly, directly through the liver itself, indirectly by its action on some gland of internal secretion, the secretion of which would act upon the liver. In the latter category are the thyroid and suprarenal body since both are included in the blood circuit and since secretions of both have known effects on the storing of glycogen in the liver.

Lucke and his associates in their experiment found that the hormone is nor-

mally carried to the blood sugar centers and the brain stem by way of the cerebrospinal fluid

Since the action of the pituitary body has an effect upon the course of diabetes, can the course of the disease be modified by measures directed towards suppressing the activity of the pituitary body? This remains to be seen Hutton¹⁰ claimed to have secured favorable therapeutic results by intensive roentgen irradiation of the pituitary body Another method of suppressing the activity of the anterior lobe of the pituitary body may be to administer large amounts of so-called female sex hormone as Amniotin Wilder and Wilbur,⁹ however, state that no observation of the former have reached their attention and that of the latter, there do not seem to be any reports of this in the clinical literature on diabetes

Let us follow the chart in the series of diabetics and note what relation endocrine imbalance may have to the cause and severity of diabetes mellitus Of seventy-two women in the series, thirty-eight had the onset of diabetes mellitus and the period of the menopause coincide Of the latter, sixteen had known cases of diabetes in their family, ten could not trace their family history, while twelve gave negative hereditary histories

During the period of menopause, there is a cessation of ovarian activity and with it a disturbance in the function of the pituitary gland and suprarenal gland There is an imbalance of the endocrine action and the individual must pass through a period of readjustment The disturbance of the suprarenal gland manifests itself by nervous systems, presented by hot flushes, chills, and parasthesias The pituitary malfunction is demonstrated by periodic headaches and changes in metabolic processes found at this time—namely, lowered carbohydrate tolerance It is at this period that females who, through inheritance are potential diabetics, become actual diabetics

Since we have noted previously that the metabolism of carbohydrates is in some way dependent on the function of the anterior lobe of the pituitary body (demonstration of Houssay, etc) and since we note that in the menopause there is malfunction of the pituitary, thus

disturbing the carbohydrate tolerance, it becomes more apparent that the menopause can contribute to the cause of diabetes mellitus, particularly those who by inherited tendencies are potential diabetics

Another factor which must be stressed and which points to some etiological factor connected with the endocrine system, is the preponderance of females amongst the obese Joslin¹¹ stresses the association of obesity with that of diabetes mellitus Seventy-seven per cent of his cases were overweight at the onset of the symptoms Lyon¹² leads to the same conclusion showing in one of his series 377 per cent females and only 83 per cent males

In referring to our group we find the percentage of obesity corresponds quite closely Of the entire number 797 per cent were overweight—71.6 per cent female, 8.1 per cent male

Joslin¹³ states that diabetes has advanced particularly in women of middle age, because with the menopause obesity is so universal and in the etiology of the disease, obesity is such a predisposing factor An increasing population of diabetic patients must therefore be expected

Possible Relation Between Gall-Bladder Disease, Pregnancy, and Diabetes Mellitus

Review of the clinical literature does not shed much light on the possible relation between diabetes mellitus and the diseases of the gall-bladder Hekimian and Vogel¹⁴ state that although association of gall-stones and diabetes is repudiated to be high, their studies of a nondiabetic group showed a slightly higher frequency of this condition than the diabetic

Study of gall-bladder disease indicates a disorder of metabolism resulting in high cholesterol excretion in the bile. Likewise during pregnancy there is an interference with the normal physiological processes, which seriously affect metabolism During pregnancy the cholesterol retention in the blood is high, particularly the last three or four months The suprarenal cortex becomes laden with cholesterol during pregnancy, but the

DIABETES MELLITUS

Number 71

bile cholesterol is low. After parturition the excess is disposed of by excretion in the milk probably to increase the low cholesterol content of the child's blood. The amount of cholesterol in the bile rises two or three times the normal level and crystals of cholesterol may be deposited in the bile passages.

In the analysis of this series, it is noted that of thirty-seven women with multiple pregnancies six (16.2%) showed history of gall-bladder trouble. Since we know that uncontrolled diabetes results in a rise in the blood cholesterol and that gall-stones result from a high cholesterol secretion in the bile, associated with diminished formation of bile salts, the question can well be raised whether the metabolic disturbances due either to pregnancy or gall-bladder disease may be a contributory cause of diabetes.

Effects of Dehydration Due to Continued Glycosuria

There is apparently some important relation between those patients who over a long period of time have continued to have glycosuria and the degree of arterial change as demonstrated by E.K. findings, oscillometric readings, and fundus examination.

Sugar usually appears in the urine when the blood sugar reaches level of 170 mg per 100 c.c. There are however many exceptions and sometimes blood sugars of 200 and 300 mg and higher are found without any demonstrable glycosuria.

It would seem in this study that the important factor is in the prolonged and continued loss of sugar with its polyuria resulting in dehydration rather than the amount of sugar lost at any one time.

Mosenthal¹⁸ made some significant observations resulting from a study of the effect of constant loss of sugar through the urine. He states that vascular degeneration is prone to occur in the protracted cases of diabetes and are most common in cases which are the outcome of inadequate treatment for ten to fifteen years. These are the patients who have had prolonged glycosuria and polyuria which results in dessication. This dessication may have a toxic influence favoring the development of arteriosclerosis and cataracts.

Hyperglycemia, according to Mosenthal, does not damage the tissues. His findings have support in the researches of Kirby, Estey, and Weiner and also those of Dr. Alexis Carrel in his work on the relation of bacterial growth to concentration of sugar. Warren says "a high blood sugar level is not in itself injurious to the heart muscle." He also states that all observations point to the conclusion that the concentration of sugar in hyperglycemia range does not favor bacterial growth.

Mosenthal¹⁸ emphasizes the point that when hyperglycemia is accompanied by hyperglycosuria, then the resultant polyuria and dessication are responsible for most of the serious complication in diabetes mellitus. In his experience, diabetic arteriosclerosis resulting in gangrene, angina pectoris, and cataracts occur almost solely in those patients who have been careless about their diet and insulin control for a period of five years or longer. The damage entailed through polyuria and glycosuria is considerable—dehydration, dessication of the tissues, hemoconcentration, malnutrition, acidosis, diminished oxygen capacity of the blood, and decreased blood supply to the skin, heart, and muscle.

The above findings are corroborated in our study of this series and the following data was obtained. Out of eighty-eight cases, eighteen were essentially sugar free throughout the course of the disease and they were conspicuously the mild or well-controlled patient with no definite evidence of arteriosclerosis or myocardial degeneration. Twelve were omitted because of indefinite classification. Of the balance all showed continued glycosuria. It is in this latter group that the most severe degenerative symptoms are prominent. Of this number we find fifty-eight (82.8%) showing abnormal E.K.'s. Of this same group, oscillometric readings of the dorsalis pedis and posterior tibialis arteries indicated a definite arteriosclerotic change while a few oscillometric readings were normal. As regards definite retinal change we find the following forty-nine cases or seventy per cent show fundus arterial degeneration. There were in this group of abnormal retinal changes ten who had cataracts.

Many observers are of the opinion that hyperglycemia is a cause of hypertension. There are others however who do not believe that the association of increased blood sugar and an elevated arterial tension is a common one. Mosenthal is of the latter school. He believes that an excess of sugar in the blood will not result in an increase in blood pressure over short periods of time. From his clinical material his deductions are that for a period of about seven years hyperglycemia will not result in hypertension.

In this series under analysis, our observation confirmed Mosenthal's hypothesis in that there does not seem to be any relation between the patient's arterial pressure and the amount of sugar in the blood.

Effect of Repeated Hypoglycemia Due to Insulin on Arterial System

The great need of heart muscle for glucose has been emphasized by our cardiologists and physiologists for many years. Cruikshank¹⁷ by his work shows the importance of providing the diabetic heart with a continual supply of available energy.

It is difficult to determine the carbohydrate requirement of the heart. There is evidence that a diseased heart requires more carbohydrate than a normal heart. Hence, lowering the blood sugar by rigid diet or insulin or both, may aggravate the cardiac condition markedly.

It is now recognized that the indiscriminate use of insulin, especially in the older diabetic, with arteriosclerosis is fraught with danger. Lowering the blood sugar in an already impoverished heart precipitates the progress of the sclerosis. The repeated hypoglycemic reactions caused by frequent insulin reactions in an apparently normal heart, leads to physiological imbalance and the development of myocardial damage through changes in the intima of the arteries. This result may be due either to anoxemia or the effect on the heart from sudden shocks due to the fluctuations from hyperglycemia to a hypoglycemia.

In view of the importance of arteriosclerosis and its complications in diabetes, Sherrill¹⁸ analyzed a series of 425 cases of diabetes with particular reference to

cardiac disease. He calls attention to the danger of hypoglycemia in arterial sclerotic diabetics on account of the production of myocardial damage. The average diabetic patient is satisfied with 120 or 150 gms of carbohydrate. High CH diets which necessitate high insulin dosage predisposes the diabetic to rapid fluctuations from hyperglycemia to insulin shock and caution should be employed.

In Sherrill's series those with angina pectoris showed that diabetes as an etiological factor in angina is very well shown by the fact that angina began on an average of 91 years after the onset of diabetes. From the standpoint of prognosis, considerable importance must be attracted to the occurrence of the two. With increasing longevity of diabetes during ten years of insulin treatment coronary disease is fast taking the place at the head of the list of diabetic complications.

Nathanson¹⁹ on 100 autopsied diabetics found forty-six per cent cardiac pathology present and of these, a characteristic cardiac lesion was coronary sclerosis. In comparison with nondiabetics he found that coronary disease is approximately $6\frac{1}{2}$ times more frequent in diabetics above the age of fifty than in the general population.

What does the analysis of our series show with reference to the problem of insulin reactions? Most of the latter group showed definite evidence of coronary disease as indicated by sub-sternal pain or radiating pain produced by exertion, and through EKG reports. The exact number is forty-two representing 47.7 per cent and is close to the findings of Nathanson.

It has been observed, since the introduction of insulin, that with more rigorous treatment of the diabetic, the cardiac manifestations may become more severe instead of improved. Susskind and associates²⁰ showed in their studies that in diabetes with well-controlled blood sugar levels considered normal, the elderly diabetics developed an increase in cardiac manifestations. This was indicated by anginal attacks, arrhythmias, and electrocardiographic changes. If the blood sugar was allowed to rise by a reduction of insulin or through increased diet, these manifestations promptly disappeared.

DIABETES MELLITUS

April 1, 1937]

The conclusion is reached that higher blood sugar values are often best in elderly diabetics with cardiovascular status and that it is best to undertreat elderly diabetics, especially if they have a history of coronary arterial pathology

Effects of Hyperglycemia and Hypercholesterolemia

As outlined above, we have considerable evidence from clinical studies that diabetes mellitus often results in major cardiac disturbances. Today, while the use of insulin has greatly eliminated the dangers of malnutrition, infection, acidosis, and coma, it has however brought up a new problem. This problem is vascular diseases which are playing a prominent part in the complications resulting from diabetes mellitus. The maintenance of an adequate amount of sugar in the blood stream is necessary for tissue energy. The blood of the diabetic has more than the required sugar for tissue metabolism, yet this sugar is unavailable for its use. This excessive sugar instead has a toxic effect. The skin of the diabetic has a lowered resistance and heals poorly, as sugar rather than glycogen is found in it. It is possible, as Klotz pointed out, that the media of the arteries degenerates from a lack of it. Insulin has for its purpose the property of lowering this sugar and making it available for use by the body.

From a study of our series we find that most of the patients having the disease for a number of years showed disturbances of the vascular system to a varied degree, depending upon the length of the disease. This is equally true of both male and female. Out of eighty-eight cases sixty-five or 73.8 per cent show vascular disturbances.

Joslin²¹ makes a similar prognosis. He states that diabetes of five years duration or longer is practically always accompanied by some degree of arterial change. He strongly favors the theory that the usual increase in cholesterol in the diabetic's blood is responsible for the vascular change.

This is likewise the viewpoint held by Aschoff who believes that an increased amount of cholesterol in the blood is one of the prerequisites for arteriosclerosis.

Within recent years, greater emphasis is being laid on cardiovascular complications of diabetes mellitus. In 1930 there were 1784 deaths in New York City in diabetic patients of which more than one-half were due to cardiovascular disease.²²

The relation between diabetes and cardiac pathology has been noted by a number of observers on necropsies as early as 1864. Seegen through his studies called attention to this close association. Similarly Huchard and Meyer in 1888 emphasized this relationship. In 1907 Brunton also observed frequency of heart involvements in diabetic patients. More recently Wilder in 1926 and Blotner in 1930 indicated that a large percentage of autopsied diabetics showed marked coronary disease.

Undoubtedly it is true that statistics show a greater number of persons suffering with vascular diseases among the diabetics than were found before 1922. This may be explained on the theory that the present day diabetic more frequently lives into the arteriosclerotic period of life by virtue of insulin. However, statistics taken indicate that the group with diabetes and cardiac condition show a higher mortality by eighteen per cent.

With a broader knowledge of the part played by insulin and the blood chemistry of the diabetic, we have a better understanding of this disease which furnishes new concepts for treatment. While in preinsulin days the greater danger to diabetics was acidosis, today the danger is in the complications of the vascular system. It is hoped that as the discovery of insulin greatly reduced the mortality from diabetic coma, so it is hoped that in the near future, our better understanding of diabetes mellitus will help to prevent the diabetic from dying prematurely from a complication of arteriosclerosis.

PENDULOUS AND HYPERTROPHIED BREASTS

The Operative Treatment

CLIFFORD F. DOWKONTT, M.D., *New York City*

In this article the writer desires to outline briefly the results of certain recent improvements in technic of the operative treatment of pendulous and hypertrophied breasts. No detailed description of the various steps involved has been attempted because (1) such description would not interest the general practitioner and (2) in the absence of the necessary experience in this particular field, it would be of little value to the surgical specialist.

The definite psychic improvement in a woman who has suffered the embarrassment of large unsightly breasts and has had them returned to their normal size, position, and youthful contour is indeed gratifying. However the exact reverse holds true when a favorable cosmetic result has not been obtained. Accordingly this operation is one which should be approached with caution by the surgeon and probably should not be attempted at all unless preceded by the experience gained by an apprenticeship or otherwise.

Several years ago an original technic for pendulous breasts was outlined¹ and later a modification of it was described.² Since then still further improvements have been made in the operative methods followed with a view to making the correction still more practical.

In the first place, the line of suture has been considerably shortened so that the resulting scar is now located only along the areolar border and on a line extending vertically downward from it to the inferior mammary sulcus. This scar habitually heals well and eventually almost disappears. Moreover the fact that there is no scar whatever above the level of the areola or outside the median line of the breast below this level makes possible the wearing of the lowest-cut gowns or costumes.

Secondly, by an adaptation of the familiar wedge-shaped excision of gland long used for the removal of cysts and

other benign growths, it has been possible to limit the correction of even markedly prolapsed breast to a single operation.

Other changes have been directed toward making the ordeal of operation simpler and easier for the patient. Thus the time of operation has been shortened to an hour and a half, avertin is used as a basal anesthetic thereby minimizing the after-effects of the anesthesia, the duration of hospitalization has been reduced to two days, and finally the suturing and dressing have been simplified so that if necessary, patients coming from a distance may return home a few days after operation to be cared for subsequently by their own physicians.

There are two questions which generally occur to a woman contemplating plastic surgery of the breasts. First she wants to know whether the operation might not cause cancer. This is prompted by a very natural dread of the disease. Of course the technic being fundamentally that long used for the excision of local growths, this cannot be the case. Moreover as outlined in some detail previously,¹ there are reasons for believing that the return of the breast to its normal position has beneficial effects on the physiology of the gland. At least excised gland cannot give rise to cancer so that theoretically the incidence of cancer in glands so operated upon should be reduced by the amount the breast has been reduced in size.

The second question concerns the retention of the normal nursing function. In this connection I gratefully acknowledge a personal communication from Dr. Ralph A. Hurd of New York City who attended a woman in confinement several years after a plastic reconstruction of the breasts had been performed. Dr. Hurd writes in part as follows: "You will be interested to learn that milk in generous quantities appeared in the breasts at the usual period after confine-

Fig 1 Before operation. The breasts extend $1\frac{1}{2}$ inches below the umbilicus

Fig 2 One year after the removal of nearly six pounds of excess tissue at a single operation.

ment, and that it could be freely expressed from the nipples"

Summary

It is hoped that the reader has gained from the foregoing remarks two conclusions, namely (1) The alleviation of the physical discomfort and mental anguish caused by enlarged breasts can be ac-

complished by a safe and practical operation (2) This operation should be performed only by the experienced

A LAY VIEW OF A MEDICAL ATTITUDE

Medical men are very strict in discipling themselves, but they have no wish to have others do it. This natural attitude is the subject of an editorial in the *New York World Telegram*, which runs

THAT ETHICAL LINE

The Kings County Medical Society adopted last week a resolution declaring its members to be "unalterably opposed to fee-splitting by either individuals or organizations in any form"

A few days later the same medical society refused to pass a further resolution calling for legislation which would make fee-splitting a misdemeanor

Here's one more instance where the organized part of a great profession is willing to proclaim ethical standards by canon, but

unwilling to have those standards enforced by law

Bar associations long clung to a similar convenient distinction between ethics and statute. But of late years the organized bar has wisely awakened to the need of putting law behind some of its most ignored canons of professional ethics

The same week the Kings County Medical Society drew the line against statutory attack on fee-splitting, Assistant District Attorney Botwin's prosecutions in the ambulance-chasing field led to the arrest of another physician, the third arrested and the twelfth involved in the current accident fraud probe

What are the medical societies going to do about the increasing evidence of medical faking in fraudulent accident claims? Adopt more toothless resolutions, or do some genuinely resolute housecleaning?

SURGICAL TREATMENT OF EMPYEMA

KENNEDY CREEVEY, M D, *Cambridge*

The study of acute empyema is of interest to medical and surgical practitioners alike as it occurs in the practices of both. It is of particularly live interest to the surgeon because, *first*, it carries a heavy mortality, roughly twice that of acute appendicitis,¹ *second*, the manner of treatment has a very marked effect on this mortality, *third*, no single method of treatment has yet gained universal approval.

The significant relation between treatment and results was clearly demonstrated by experience in the U S Army Hospitals during the war when the mortality in similar cases was reduced from around thirty per cent to about ten per cent² by the application of a principle which is now well-known. This principle is that open drainage of an empyema in the presence of a still active pneumonia or in the absence of walling off of the empyema cavity is harmful or fatal to the patient. We hardly need to mention here the physiological basis for this, demonstrated by Graham and Bell³ in 1918, that the normal mediastinum is flexible so that the pressure changes involved affect both lungs to some extent, this may easily reduce an already impaired vital capacity to the point of causing death.

With the general recognition of this fact, then, around 1920 began the most recent era in treatment of empyema, the principles of which are, as agreed by all authorities (1) adequate drainage and (2) avoidance of open drainage in the early stages.

The application of these principles has, so far, not led to uniformity in the method of treatment. In the literature of the past ten years, there are reports advocating three different methods—(1) repeated aspiration, (2) closed drainage, and (3) open drainage. Inasmuch as the final evaluation of these has not been reached, further data on the subject is of interest.

With these considerations in mind, we propose to add to the record the experience of the Mary McClellan Hospital. Although this report deals with a small series, it has, perhaps, an added significance in that there are relatively few such reports from rural hospitals.

Since the opening of the Hospital in 1919, thirty-seven cases have been treated with four deaths, a mortality of 10.8 per cent. The age of incidence is distributed between two and seventy-one years, with half of the cases under sixteen years of age. Twenty-two (60%) were caused by pneumococcus, seven (20%) by streptococcus.

The treatment has been quite uniform—rib resection and open drainage in thirty-four cases, intercostal open drainage in a two year old infant who recovered, closed drainage in a thirteen year old girl who was too ill for rib resection, and died, no operation in one case who remained cured after three taps. One case, a boy of thirteen, who had a synchronous pericarditis, had closed drainage as a preliminary to rib resection.

The time for operation is adjusted to the clinical evidence of subsidence of pneumonia, evidence of walling off as indicated especially by the presence of thick pus. In the usual case, with a large collection of pus, a section of the seventh or eighth rib near its point of greatest convexity is removed, after reflection of the periosteum. No further precaution is used to prevent osteomyelitis. To insure adequate drainage, two tubes are usually inserted. Postoperatively the patients are encouraged to use blow bottles or balloons. Irrigation with Dakin's solution is employed rarely, in cases which are not clearing up satisfactorily.

The preferred anesthetic for the sicker cases is, of course, local one per cent novocain. Sixteen of the series, however, received ether and eleven nitrous oxide. In view of the frequently ex-

Read before the Washington County Medical Society, Hudson Falls, October 6, 1936

pressed opinion against the use of ether in all types of pulmonary infection, it is interesting to note that no particular bad effects can be traced to it here. Two of the sixteen died, but one of these lived until five months later, while the other was a sixty-six year old man with a multilocular abscess, streptococcus infection, and evidence of mitral valvular disease of the heart. He apparently died of an embolus, eight days after operation. Except for immediate vomiting, the post-operative reactions after ether have been in general no more severe than after other anesthetics.

The average number of days in the hospital was fifty-two. Two cases had secondary operations, one of these died of chronic empyema.

Of the nonfatal complications, the following deserve mention. Osteomyelitis of the rib, one, abscess of gluteal region, one, abscesses of neck, one, pericarditis, one.

Death occurred in the following four cases.

1 A twenty-one year old man was admitted three weeks after the onset of an acute illness characterized by fever and diarrhea. He had a multilocular empyema at the right base drained five days later. He failed to improve, and within ten days developed a serous effusion in the left pleura which was tapped. X-ray demonstrated satisfactory drainage of the empyema, but he developed pneumothorax on the left and died forty-four days after operation. Repeated cultures and sputum examinations were inconclusive, it is felt that he probably had tuberculosis. No autopsy was permitted.

2 A sixty-six year old man, admitted fourteen days after the onset of a relatively mild pneumonia, gradually developed empyema at the right base, rib resection thirteen days after admission. He showed the expected improvement but died very suddenly on the nineteenth postoperative day. He showed evidence of arteriosclerotic heart disease, as well as systolic and presystolic murmurs. Death was probably caused by an arterial embolus. The infecting organism was a pneumococcus. No autopsy was obtained.

3 A twenty-eight year old man was admitted six weeks after the onset of lobar pneumonia with a large empyema on the left. Rib resection was done four days after admission. Postoperative course was un-

satisfactory, the wound was reopened twice in 120 days, and the patient was discharged in good condition after nearly six months. The hospital was unable to follow this case but he is known to have died at home about four months later. It is assumed that death resulted from chronic empyema. The only organism cultured from the wound was staphylococcus aureus.

4 A thirteen year old girl was admitted in poor condition two weeks after the onset of pneumonia. She developed a purulent effusion which was tapped repeatedly, and finally drained through a tube. She died twenty-three days after admission. The infecting organism was pneumococcus.

In brief then we may summarize our series as follows: thirty-seven cases treated by open drainage, with a mortality of eleven per cent.

To obtain comparative figures we turn to the literature on this subject during the past decade. In so doing, we notice with interest that many of the articles are presented with the purpose of demonstrating the advantages of one or the other of the three different methods of treatment mentioned above—repeated aspiration, closed drainage, and open drainage.

The repeated aspiration method, of course, consists of tapping the empyema through a needle as often as sufficient fluid accumulates. This was the method of the nineteenth century when results were very poor.⁴ Elaborations on this method in recent years have included aspiration followed by injection of some disinfectant^{5,6} and injection of air.⁷ Although good results have been obtained in a few small groups of cases, it is distinctly the consensus of opinion that the majority of cases will not yield to tapping, chiefly because the thick pus and fibrin which accumulate cannot be drawn through a needle.

One illuminating fact is accentuated by the study of this method and has also been noted elsewhere: there are a few favorable cases of empyema which will clear up after only one or several tapplings.

The closed drainage method was introduced in this country about 1919.⁸ The essence of this method is the introduction of a tube into the cavity through an airtight wound, and the connection of

this tube with a closed system of fluid which will exert suction, thus emptying out the pus and drawing out the lung to obliterate the cavity. It is not our intention to review all the arguments for and against this type of treatment. Suffice it to say that it offers one great advantage—the obviously beneficial effect of the suction, and one great disadvantage, that the tube tends to plug up with fibrin.

The latter consideration would appear at first sight a mere detail, but it is a serious objection in practice. A plugged tube does not give adequate drainage

ally a complication of pneumonia, and since most fatal cases of empyema are associated with one or more other conditions which may be fatal in themselves, mortality statistics, even on large groups of cases, are subject to marked variation in interpretation.

The mortality in infants under two is so high that many authors report it separately. We have included this subdivision in the accompanying table.

It is a surprise to find any comparative figures so nearly identical. This very unanimity however is, we believe, most

TABLE I

Of more value than general discussion for evaluation of the method is a study of the results obtained by it compared to those obtained by the more widely used open drainage, usually with rib resection.

The statistics on this subject as presented in the literature up to date are relatively few and do not warrant the deduction of fine drawn conclusions. We have, however, been interested in tabulating the mortality statistics of cases treated by the closed method and those treated by the open method. In doing this we have limited ourselves to series which are as nearly strictly comparable as possible; they are all cases treated in this country later than 1920.

It is not necessary to mention in the face of the paucity of the figures, how unreliable such statistics may be, except to point out that since empyema is usu-

instructive. Although the data included in this comparison are rather meager, we are justified in concluding from it that no significant advantage of one system over the other with regard to mortality has yet been demonstrated.

In regard to other significant points, we cannot reduce our comparison to simple figures. We have found, however, that the majority of published experience and opinion is agreed that both methods yield about the same number of complications, and the same length of illness.

The reasonable and not unexpected conclusion to be drawn from these considerations is that neither method is so much better as to be adopted to the exclusion of the other. It seems probable that the best results will be obtained by the judicious use of both.

Naturally some types of cases may be

more satisfactorily dealt with by a closed suction system, particularly streptococcus infections in which the effusion is thin and usually occurs synchronously with the relatively long drawn-out pneumonia. In contrast pneumococcus empyema, usually occurring after the subsidence of pneumonia, characterized by thick pus, much fibrin, and earlier walling off, presents a process calling for ample drainage.

We may advocate, then, a policy of utilizing closed drainage whenever that is practicable, with a particular emphasis on its use for streptococcus infections. Rib resection may be carried out without

hesitation when drainage with the closed system becomes inadequate.

Conclusions

1 A series of thirty-seven cases of acute empyema treated by open drainage is presented, mortality eleven per cent.

2 A comparative survey of the recent literature demonstrates a practically identical mortality of eleven per cent for cases treated by the closed and open types of drainage.

3 A policy of combining both types of drainage as governed by specific indications, is advocated.

"DELIGHTFUL TWADDLE" ABOUT CANCER

"Twaddle" was Dr. Francis Carter Wood's comment on a lead article in *Coronet* entitled, "Is Milk Cancer's Ally?"

"It is the most delightful piece of twaddle I've read in a long time," said Dr. Wood, director of the Institute of Cancer Research at Columbia University, as reported in the *New York World-Telegram*.

The article, written by Walter Clare Martin, asserts "cancer is aided, abetted, stimulated and protected by the pressure of cholesterol," and "the chief source of cholesterol is milk."

The editors of *Coronet*, in a note following the article, state—"Coronet would rather print the answer than the question, but feels that the question cannot decently be ignored."

"There is no evidence that diet has anything to do with cancer," Dr. Wood said. "Eskimos eat neither vegetables nor milk, and they have cancer."

He asserted there was no evidence cancer was aided by the pressure of cholesterol and said that eggs, not milk, were the chief source of cholesterol.

"Cows do not have cancer," he observed.

In the article Mr. Martin says—"For years Switzerland, a milk and cheese nation, was thought to hold the world pennant for cancer. Now Scotland—which one tourist glorified as an island of oatmeal in an ocean of milk—is beginning to beat the yodelers' record."

"The reason there has always been a higher cancer rate in Switzerland," said Dr. Wood, "is that more autopsies are made there than elsewhere. In Switzerland there is autopsy in ninety per cent of all deaths. In this country there is autopsy in only two per cent of all deaths."

"If the cancer rate is going up in Scotland it means that the Scottish doctors are getting more expert. The cancer rate is in direct proportion to the effort of the doctors in the community."

"Mr. Martin says American Indians did not have cancer. Who was around to investigate the American Indians? He says that Southern Negroes, who drink less milk than the whites, have less cancer. They have less cancer only because they are unable to secure physicians who can diagnose their cancer."

CANCER OF THE RECTUM

With Acute Lead Poisoning (Industrial)

IRVING GRAY, M D , F A C P and IRVING GREENFIELD, M D , *Brooklyn*

The literature on the relationship of cancer to industrial hazards is rather scant. There are occasional reports and statistical studies in the English^{1,2} and American^{3,4} literature of the incidence of cancer among chimney workers, wool sorters, pitch and tar workers, and those employed in industry where the skin is exposed to irritating chemicals. There is little, however, on the subject of cancer and its occurrence in individuals exposed to the absorption of lead.

There is an increasing literature on the subject of lead in the treatment of cancer. Bullock and Cramer⁵ showed that lipid substances were contained in malignant cells in much greater concentration than in normally growing cells. Bell⁶ was the first (1922) to demonstrate experimentally that lead combines with lecithin, and for that reason he believes that this heavy metal influences cells rich in this substance. After Bell's publication⁷ in 1924, Glynn⁸ (1926) recorded unusual histological changes occurring in the cancer cells of a patient treated with colloidal lead injections. In 1928, Ullman⁹ reported favorable results in two patients with cancer of the breast with extensive metastasis treated with colloidal lead orthophosphate. Impetus to the use of lead in cancer has recently been given by the reports emanating from the work of Borgen of the Mayo Clinic. In 1935, this worker¹⁰ recorded the results of the treatment of malignancy with intravenous injections of lead.

In performing chemical analysis of cancer tissues from Bell's patients who were treated with colloidal lead phosphate intravenously, Patterson,¹¹ found a greater concentration of lead in malignant tissues than in nonmalignant tissues. This observation has been confirmed by Borgen.

In view of the fact that there has been increasing interest in the use of intravenous lead therapy for the treatment of

cancer, we are prompted to report a case of cancer of the rectum in an individual who contracted acute (industrial) lead poisoning. Despite the acute toxic symptoms and evidence of abnormal retention of lead in the tissues, there was progressive increase in the size of the growth.

Case Report

J O'B, age 51, white, married, was employed as a riveter on an iron construction project in August 1934. He was exposed to the inhalation of lead fumes in an enclosed chamber. The iron girders used in the construction projects were painted with red lead. In driving the hot rivet thru the girder, the paint was heated and the fumes liberated into the enclosed chamber. Some two months after he was employed, he began to complain of abdominal pain and cramps associated with increasing weakness, anorexia, and constipation. He continued to work until January 1935 and was daily exposed to the inhalation of lead fumes. He wore no respirator. After five months of such occupational exposure, he was compelled to stop working because of the increasing severity of the abdominal cramps, constipation, and weakness.

Physical examination revealed a white, male adult, with a marked pallor, underweight and appearing about ten years older than the stated age, past history essentially negative. Other than the poor oral hygiene and the marked pallor, there were no abnormal findings on objective study. The heart, lungs, and abdominal examination showed no departure from the normal. Likewise the neuromuscular system presented no abnormalities. There was a hypotension of 98/80 present.

Blood study showed hemoglobin seventy per cent rbc. 3,030,000, wbc. 9,900, platelets 260,000, Polys seventy-seven per cent, lymphs twenty-one per cent, eosin, two per cent, stippling, ten cells per fifty fields. In view of the history of exposure, the general appearance of the patient, the symptoms and findings on blood study, a diagnosis of lead poisoning was made. The patient was admitted to the Brooklyn Jewish Hospital for study and treatment.

From the Department of Medicine, Jewish Hospital of Brooklyn

First Hospital Admission

March 13 to April 15, 1935

Laboratory studies on admission were as follows Wassermann and Kahn tests, blood chemistry (including sugar, creatinine, calcium, and phosphorus) studies, liver function and glucose tolerance tests, urine, urea clearance, and Mosenthal tests were all normal. Examination of the urine and stool for lead failed to reveal the presence of this heavy metal in the control specimens. The patient was placed on deleading therapy as recommended by Aub and his co-workers.¹² In addition he was given a high phosphorus, low calcium diet.¹⁸ Shortly after the institution of this regime the patient began to liberate lead from the tissue depots and to excrete it in the urine and stool. Urine examinations revealed the presence of 0.2 mgm and 0.3 mgm of lead per liter of urine, on two consecutive studies. Examination of the stool revealed the presence of 1.6 mgm, 1.0 mgm and 3.0 mgm of lead per 100 gram of ash stool on three consecutive studies. After three weeks of deleading therapy, the patient was discharged from the hospital improved. Abdominal colic had disappeared and bowel function was normal. A high calcium, high caloric, high vitamin diet was prescribed.

On May 12, four months after the cessation of exposure, the patient had severe rectal bleeding which subsided following rest in bed. Examination revealed the presence of a mass on the anterior rectal wall just above the prostate and within reach of the examining finger. The mass was hard and irregular and appeared to be pressing on the anterior rectal wall.

Second Hospital Admission

June 18, 1935

In addition to the established diagnosis of lead poisoning, a diagnosis of carcinoma of the rectosigmoid area was made. In view of the course of the disease, exploration was deemed advisable. Operation was performed on July 23.

Operative findings included markedly distended and thin-walled sigmoid. The pelvic sigmoid was firmly fixed by a hard indurated mass in the pelvis which surrounded it on three sides. This mass was covered with peritoneum, its surface was irregular and nodular. There were a few large retroperitoneal glands which could not be dissected free. No glands were present in the omentum. A colostomy was done. In spite of supportive measures which included repeated transfusions, venoclyses, and hypodermoclyses, the patient gradually became

worse and died on August 16, approximately three weeks after the operation.

Autopsy and pathological study of the tissues was done by Dr. Bela Halpert. The essential findings included the specimen from the rectum which was an irregularly shaped mass of tissue, 3.5 x two x one cm., which on microscopic study showed tall columnar cells forming tubular structures of solid masses embedded in a scanty connective tissue stroma which were seen invading and replacing portions of the muscular coat. Extensive areas of necrosis were seen in the central parts of the tumor cell masses. A dense infiltration of small round and large mononuclear cells and many polymorphonuclear leukocytes were seen in the stroma. A diagnosis of carcinoma of the rectum (cylindrical cell type) was established. Chemical analysis for lead of the liver, spleen, lung, heart and brain was done. The following were the amounts of lead found in one hundred grams of semi-dry tissues:

Liver	2.156 mgm.
Spleen	0.563 mgm
Lung	0.256 mgm
Heart	0.132 mgm
Brain	3.201 mgm

(1453 gms whole brain)

Comment

Kehoe and his coworkers¹⁴ showed that lead is present in the organs of individuals not exposed to industrial hazards (liver, spleen, lung, heart, etc.). These amounts were present in one hundred grams of tissue examined:

Liver	0.08 mgm
Spleen	0.00 mgm
Lung	0.00 mgm.
Heart	0.00 mgm

In view of the presence of lead in these amounts in normal tissues, we can safely state that our patient had a definite retention of lead in the tissues. The clinical record in this case indicates that the mass in the rectum became increasingly larger. While it is difficult to estimate the exact amount in mgms of lead the patient inhaled and absorbed into his blood stream, there is sufficient evidence to indicate that there was an abnormal amount of lead retained in all the tissues as was shown biochemically. The lead absorbed was in no way a factor in preventing the growth of the neoplasm. This fits in

with Hoffman's¹⁵ statistical study of 2,000 death certificates of lead workers in the United States. The mortality rate for painters shows no material effect of lead as an inhibiting factor in the growth of cancer.

There may possibly be a difference in the behavior or action of lead introduced via the intravenous route as against that introduced via the upper respiratory channels. Colloidal lead has some detrimental effect on malignant cells when introduced intravenously.¹⁶ We are reporting our observations in a patient with cancer of the rectum who has abnormal amounts of lead in his tissues. The favorable results obtained by some investigators following the use of lead in the

treatment of carcinoma may be due to the large doses and the intravenous route of the introduction of the heavy metal. In our patient, despite the abnormal amount of lead in the tissues and circulating blood, the growth was in no way inhibited in its progress.

Conclusions

1 Case report of cancer of the rectum developing in an individual with acute lead poisoning (industrial)

2 Industrial lead poisoning was not a factor in retarding the growth of a rectal malignancy

ALTMAN FOUNDATION SUPPORTS SPEECH AND HEARING NURSERY SCHOOL

A recent grant made by the Altman Foundation to the Women's Auxiliary of the New York League for the Hard of Hearing has assured the Nursery School which it is sponsoring of a degree of permanency. This school was opened only on February 1 but has already attracted the interest of numerous individuals and groups who have attested that interest by their contributions to the upkeep of the school.

The unique features of this nursery school are the admission of a limited number of children with impaired speech and hearing into a larger group of normally hearing and

speaking children of the same age, and the emphasis upon all health aspects of the work. Children of ages two and three are eligible and preference is given to the younger group.

The school activities are planned to further the growth and development of the preschool child, and are supplemented by special techniques in the development of speech and of lipreading. Observers are welcome at any time—the school session is nine to twelve St Mary's Hospital for Children, 405 West 34 Street, New York City.

DO YOU KNOW?

Maintaining normal weight is one means of postponing heart trouble. A middle-aged person who has become thirty pounds overweight has added some eighteen miles of blood vessels to his system, placing an ab-

normal burden on his heart at a time when he should be protecting it from undue exertion—*From the press Bulletin issued by the Bureau of Public Relations of the Medical Society of the State of New York*

MILK DIGESTION

Mechanism and Modification

I NEWTON KUGELMASS, M D, *New York City*

Digestion of milk in the infant's stomach differs markedly from that in the test-tube. On adding gastric juice to cow's milk the coagulation is slow, the curd tough, and the clot retraction rapid. The solubility of the clot is inappreciable in both acids and alkalies. On adding acid to cows milk the coagulation is rapid, the curd flaky, and the clot retraction nil. The solubility of the clot is appreciable in both acids and alkalies. The former represents rennet clotting of milk and the latter, acid clotting. We have already reported¹ on the individual mechanisms involved in each process *in vitro*. But in the infant's stomach both mechanisms operate on portions of milk ingested flowing through a turbulent apparatus.

Healthy infants of six to thirty months were given the milk or formula studied, the aminonitrogen determined by the Ván Slyke apparatus with microburette² from the gastric contents withdrawn at fifteen minute intervals after feeding and the blood aminonitrogen estimated simultaneously by colorimeter³. The soluble nitrogen content of the stomach was considered as the index of protein disintegration in the course of digestion⁴. The aminonitrogen of the blood was indication of the rate of nitrogenous absorption from the intestinal tract. The infants studied were recovering from conditions unrelated to alimentary function. The data obtained for each milk or formula is the average of two determinations for each infant. The results are relative because of volume diminution, gastric dilution, and aliquot differences. (Table I)

The curves for aminonitrogen determinations of the gastric juice and blood respectively, taken at periodic intervals after the ingestion of various types of milk

and their formulae, clearly reveal the course of digestion and absorption of milk proteins. There are two types of curves for gastric digestion, the double parabolic curve for slow digestion and the single parabolic curve for rapid digestion. Fresh cow's milk is the slowest and acid milk the fastest to be digested in the infant's stomach. Powdered milk belongs to the former type and evaporated milk to the latter type of gastric digestion. Whatever the type of milk there is a marked initial rise in the soluble nitrogen, lowest with cow's milk and increasingly higher for powdered milk, evaporated milk, and acid milk respectively (Chart I). After the initial peak within the first half hour after ingestion of milk there is a secondary rise in soluble nitrogen for slow-digesting milks but a marked fall for fast-digesting milks.

The maxima for slow-digesting milks occur in the second peak of digestion while maxima for fast-digesting milks occur in the initial rise of soluble nitrogen. The type of maximum attained for the gastric aminonitrogen characterizes the rate of digestion of the milk. For rapidly digested milks the maxima appear early while in slow digested milks the maxima are delayed. Modification of milk by carbohydrate, dilution, and heating accelerates the course of digestion in comparison with the type of milk used as a control. The maximum for the formula of each type of milk appears sooner than that for milk alone. After the second hour the concentration of soluble nitrogen is still high in slow-digesting milks but low in fast-digesting milks indicating the characteristic emptying time for that milk in the infant's stomach. The residual curd at the end of the second hour was high with fresh milk, moderate with powdered milk, minimal with evaporated milk, and absent

This work was aided by grants from the Nutrition Research Fund and the Milk Research Council

with acid milk. The residue was diminished by modification of each milk.

The course of the soluble nitrogen content of the stomach was followed simultaneously in the blood of the infants studied. The aminoacid content of the blood represents a product of milk protein on its way from the alimentary tract to the tissues. The normal aminonitrogen of the blood of infants varies between five and seven mgms per cent rising during milk digestion to between nine and twelve

milks, the former showing a broader zone of aminonitrogen level in the blood than the latter. The fall in blood ammonitrogen during digestion is slow for cow's milk and rapid for acid milk. Striking is the parallel between the curves of gastric and blood aminonitrogen after the ingestion of various types of milk.

Discussion

Cow's milk ingested as a fluid is transformed physically and chemically in the

TABLE I—RATES OF MILK PROTEIN DIGESTION AND ABSORPTION

	0	15m	Post-Feeding Time					
			30m	45m	60m	90m	120m	
CERTIFIED COW'S MILK								
Gastric aminonitrogen	25	80	75	70	72	82	95

Blood aminonitrogen	5 2	9 8	10 0	8 2	6 0	4 8		
ACID MILK FORMULA								
Gastric aminonitrogen		120	125	115	80	30	15	

mgms per cent. The aminonitrogen content of the milks used in these studies showed an average of 7.2 mgms per cent for fresh cow's milk, 6.5 for powdered milk, 5.8 for evaporated milk, and 12.5 for acid milk.

The rise in the blood aminonitrogen is slight for slow-digesting milks and rapid for fast-digesting milks, the curves paralleling those obtained for the rate of gastric digestion. Indeed the slope of the aminonitrogen curve of the blood is not only an index of the rate of nitrogenous absorption but as well of the rate of gastric digestion. The maximum blood aminonitrogen obtained appears at the end of an hour after the ingestion of cow's milk and at the end of twenty minutes after the ingestion of acid milk. The average rise in the aminonitrogen is less for slow-digesting milks than for fast-digesting

stomach, the reservoir for preliminary digestion. The milk dissolves the inappreciable amount of gastric juice normally present and stimulates a gradually increasing secretion of about 0.1 N HCl and the enzymes rennin and pepsin, and possibly kathepsin. These enzymes now become dispersed in acidified milk, the cleavage of caseinate is initiated by rennin, and acid hydrolysis is begun by peptic catalysis. But each of the constituents of the gastric juice encounter chemical difficulty with milk—hydrochloric acid with the buffer effects of the inorganic salts, and rennin and pepsin with the precipitated form of casein. The buffer salts of milk prevent a marked rise in the hydrogen ion concentration of the stomach contents, the precipitation delays protein hydrolysis. The formation of a solid curd delays digestion even more

than does the high buffer value of liquid milk. Neither reaction is necessary nor desirable for gastric digestion. But both the buffer and curd obstacles to digestion occur only between the pH range of 6.5 and 4.5, a zone readily passed with normal digestive activity. These preliminary changes of milk by gastric juice may be modified or prevented to augment digestive efficiency in the infant's stomach.

The mechanism of milk clotting and its relation to the character of curd formation¹ have already been presented. Within the stomach liquid milk is partly changed into a solid by the combined rennet, pepsin, and acid coagulation. Even under the most favorable gastric conditions no more than half of the milk is coagulated. During the first ten minutes of the preclotting period, fluid milk passes through the pylorus and during the clotting period about forty per cent of the remaining milk is coagulated. The amount and character of the clot depends upon the nature of the milk or formula ingested. Fresh and dried milks yield firm clots while evaporated and acid milks give soft clots. The former are concentrated, contracted, and of great tensile strength while the latter are voluminous, spongy, and inappreciable in curd tension. Whatever the curd formed, the gastric contents remain semi-fluid for there is no actual separation of the solid phase. Firm clots are disintegrated by peristaltic movements into smaller particles sufficiently dispersed for digestion and passage through the pylorus. With poor gastric motility the hard curd acts like a foreign mass which may be regurgitated or if passed on disturbs intestinal function. Soft clots are not only well-dispersed but readily permeated by gastric juice with uninterrupted hydrolytic action. The rate of gastric digestion is about twice as fast for soft curds as for hard curds. Cow's milk modified by boiling, dilution, acidification or colloidation will yield a soft curd in the stomach.

Curd formation is maximal and protein digestion is minimal in the stomach. The rate of dissolution of milk curd depends on the hydrogen ion concentration of the stomach contents. In normal infants the initial gastric pH 4.0-5.0 decreases but slightly with fresh cow's milk and signif-

icantly for evaporated and acid milks after thirty minutes of ingestion. The individual variations in gastric pH are rather marked. But once the pH becomes lower than 4.5—the isoelectric zone for casein—peptic digestion is accelerated. It is most active with electropositive casein, the lower the pH, the greater the amount of ionized casein. But the degrees of acidity observed for optimal peptic digestion *in vitro* are not reached in the stomach until the second hour, after the peak of soluble nitrogen has been attained. Apparently gastric digestion in the infant differs from artificial digestion in the test-tube only in the physiologic conditions rather than in the mechanism. Despite all theory the normal infant digests casein remarkably well in the stomach and to a greater extent than predicted from *in vitro* experiments.

Clinically the pH zone for enzyme activity in the stomach is considerable. The functions of both rennin and pepsin are dual—digestion and coagulation. While each role is more or less determined by the gastric pH yet they are not mutually exclusive. Rennin is an electrolyte with an isoelectric point of 6.5. Above this pH it is electronegative and the same charge as casein and paracasein. With the electrical charges alike, rennin digests casein. Below pH 6.5 rennin is electropositive and of opposite charge to casein and paracasein. With the electrical charges opposite, rennin coagulates paracasein. The same mechanism maintains for pepsin. Its isoelectric point is 2.8. Above this pH pepsin is electronegative, opposite in charge to casein and hence coagulation. Below this pH pepsin is electropositive, similar in charge to casein and hence digestion. Despite the marked coagulation effect of both rennin and pepsin on milk throughout the pH range 2.8-6.5, active digestion occurs as evinced by rapid formation of soluble nitrogen in the stomach.

Summary

1 Rennet clotting, resulting from the addition of gastric juice to cow's milk, is characterized by slow coagulation, tough curd, rapid clot retraction, and insolubility of the clot in both acid and alkalis. Acid clotting, resulting from the addition

of acid to cow's milk, is characterized by rapid coagulation, flaky curd, non-retracted clot, soluble in both acid and alkali. Both processes operate on portions of milk within the infant's stomach.

2 The soluble nitrogen content of the stomach was considered as an index of

CHART I—Comparative Rates of Gastric Digestion of the Protein of various types of milk formulas, and the rates of nitrogenous absorption by the blood

protein disintegration during digestion and the aminonitrogen of the blood, the criterion of protein absorption from the intestinal tract

3 Two types of curves characterize the gastric digestion of milk, the double parabolic curve for slow digestion and the single parabolic curve for rapid digestion. Fresh cow's milk is the slowest and acidified milk is the fastest to be digested in the infant's stomach. Powdered milk belongs to the former type and evaporated milk to the latter type of gastric digestion. The soluble nitrogen maxima for slow-digesting milks occur in the second peak of digestion while maxima for fast-digesting milks occur within the first half hour after the ingestion of milk. Modification of milk by carbohydrate, dilution, heating, and colloid addition accelerates the course of milk digestion.

4 The normal aminonitrogen of the blood of infants varies between five and seven mgms per cent rising during milk

digestion to between nine and twelve mgms per cent. The rise in the blood aminonitrogen is slight for slow-digesting milks and rapid for fast-digesting milks, the curve paralleling those obtained for the rate of gastric digestion. The soluble aminonitrogen maximum of the blood appears at the end of an hour after the ingestion of cow's milk and at the end of twenty minutes after ingestion of acid milk.

5 The curd formation delays digestion more than does the high buffer value of liquid milk particularly between pH 6.5 and 4.5. At lower gastric pH levels peptic digestion is accelerated with ionized electropositive casein. Gastric digestion in the infant differs from artificial digestion in the physiological conditions rather than in the mechanisms, for despite theory the normal infant digests casein remarkably well within the stomach.

TO DOT THE STATE WITH SYPHILIS WARNINGS

One of the State Health Department's latest projects in connection with its syphilis program is the placing of signs in public places throughout the State, which emphasize the curability of the disease by early and appropriate treatment. The work of soliciting the cooperation of proprietors of restaurants, hotels, and gasoline stations, and of posting signs is being done by the National Youth Administration.

Significant of the changing public attitude toward syphilis is the fact that at least one of these signs has been placed in ninety-seven per cent of the restaurants, hotels and gasoline stations visited in the city of Poughkeepsie, and eighty-five per cent of all places visited in the city of Syracuse.

Several large oil corporations have written the Department endorsing this method of publicizing facts about syphilis. Excerpts from some of the letters follow:

The ——— Oil Corporation is thoroughly in accord with this move in the interests of public welfare, and we will do everything possible to facilitate the placing of these signs in stations at which our products are sold. You are at liberty to use this letter or copies of it in approaching any members of our field sales organization or in discussing with our dealers the feasibility of their using these signs.

We believe that the publicity program of the New York State Department of Health for control of syphilis is a worthwhile project and approve of having publicity material in the local gasoline stations.

We shall be glad to cooperate with you in reference to the intensive effort you are making to acquaint the public with the serious results which may follow when syphilis is untreated and with the possibility of cure when it is treated early and properly.

That cancer is not common among primitive people is now explained mainly on the

ground that they do not live long enough to die of this disease.

TROUBLED WRITERS

A Note on the Psychopathology of Literature

LOUIS J BRAGMAN, M D, Binghamton

Frances Winwar, in the author's note prefacing her recently published *Poor Splendid Wings The Rossetti's and Their Circle*, says "This is not fictionalized history or biography, though it read like a novel, nor is it a Freudian study of the men and women who played their part in the Pre-Raphaelite drama, though the student will detect the methods of modern psychology without those barbarisms that should have no place outside of clinical reports" Yet this remarkable story is so crowded with psychopathological implications that it is questionable if the truth can actually be ascertained minus those *barbarisms*

There are, of course, barbarisms (medically speaking), that have no place outside of clinical reports, not because of the engenderment of a squeamishness, but rather since such matters are not, *suu generis*, significant from a literary or critical viewpoint "A physician," says Whittier, and he might also have meant a psychiatrist, "could not be otherwise than melancholy—he sees incipient disease where the uninitiated see only delicacy" Medicoliterary gossip for its own sake, unrelated intrinsically to critical discussion, is out of place in biographical analysis But where incipient or advanced and manifest pathology is an integral force in creative expression, it cannot be unseemly or unfastidious to introduce it.

"The place of the literary critic might well be taken by the psychopathologist," writes Jeannette Marks in *Genius and Disaster* Of course, no such specialist would be so presumptuous as to attempt to supererogate the literary critic, yet literary criticism, in the light of modern psychology, must be wholly ineffective if psychopathological factors are overlooked "Bunyan was a sick soul Literature owes much to the sick soul," comments W Langdon Brown, writing (*St Bartholomew's Hospital Gazette*, September 1933) on *The Psychology of*

Authorship Frances Winwar is of course intensely and alertly aware of this, as is apparent throughout her keen analysis of that distinguished but bizarre circle of poets and painters But are *barbarisms* out of place in what is actually an elaborate clinical report?

In his Cambridge lecture of recent date, A E Housman said

Who are the English poets of that age (the eighteenth century) in whom one can hear and recognize the true poetic accent emerging clearly from the contemporary dialect? These four Collins, Christopher Smart, Cowper and Blake And what other characteristics had these four in common? They were mad

Is there a direct causative relationship between madness and creative genius, between sick souls and literature? Is it true "that great writing springs from a terrible driving unrest"? Are the makers of literature troubled writers whose lives have been spent abreast troubled waters?

It has long been recognized that there is a direct connection between inner unrest and outer productiveness David consoled himself in his hours of sadness by composing his psalms Aristotle pointed out how often eminent men displayed morbid mental symptoms Plato distinguished two kinds of *delirium* the one, an ordinary insanity, the other, the spiritual exaltation which produced poets, inventors, prophets, and the like Not that the first group is entirely sterile, however else one might view an anthology entitled *Poetry of the Insane*, recently compiled by Dr Charles E Mayo Nathaniel Lee, according to J F Nisbet in his *Insanity of Genius*, long an inmate of Bedlam, stated "It is difficult to write like a madman though it may be easy enough to write like a fool"

Of the *furor poeticus* of the Romans, it might be inferred that Holmes had somewhat of the same thought in mind when he said that during the writing of

protein disintegration during digestion and the aminonitrogen of the blood, the criterion of protein absorption from the intestinal tract.

3 Two types of curves characterize the gastric digestion of milk, the double parabolic curve for slow digestion and the single parabolic curve for rapid digestion. Fresh cow's milk is the slowest and acidified milk is the fastest to be digested in the infant's stomach. Powdered milk belongs to the former type and evaporated milk to the latter type of gastric digestion. The soluble nitrogen maxima for slow-digesting milks occur in the second peak of digestion while maxima for fast-digesting milks occur within the first half hour after the ingestion of milk. Modification of milk by carbohydrate, dilution, heating, and colloid addition accelerates the course of milk digestion.

4 The normal aminonitrogen of the blood of infants varies between five and seven mgms per cent rising during milk

digestion to between nine and twelve mgms per cent. The rise in the blood aminonitrogen is slight for slow-digesting milks and rapid for fast-digesting milks, the curve paralleling those obtained for the rate of gastric digestion. The soluble aminonitrogen maximum of the blood appears at the end of an hour after the ingestion of cow's milk and at the end of twenty minutes after ingestion of acid milk.

5 The curd formation delays digestion more than does the high buffer value of liquid milk particularly between pH 6.5 and 4.5. At lower gastric pH levels peptic digestion is accelerated with ionized electropositive casein. Gastric digestion in the infant differs from artificial digestion in the physiological conditions rather than in the mechanisms, for despite theory the normal infant digests casein remarkably well within the stomach.

CONGENITAL SYPHILIS IN ONE OF IDENTICAL TWINS

Report of a Case

OSWALD J. MCKENDREE, M D , *Utica*

Utica State Hospital

The occurrence of syphilis in twins is not uncommon, but the presence of syphilis in only one of twins is a rare occurrence. Since the existence of lues in newborn infants was recognized by Gaspar Torella in 1498, the problem of congenital syphilis has gradually become better, though not completely understood.

Before proceeding further an understanding of the terms congenital and inherited syphilis is necessary. Solomon¹ in his book, "Syphilis of the Innocent" has clarified this point by employing the term congenital syphilis to describe those cases in which the infection of the offspring has taken place at some time between conception and the child's existence independent of the body of the mother. By inherited syphilis he believes one should mean that no direct infection of the offspring has occurred, the parental germ plasma instead being damaged by toxins from the *Treponema pallidum*. According to that writer, syphilis which has invaded the central nervous system of the newborn produces one or more of the following conditions:

- 1 Feeble mindedness
- 2 Juvenile paresis
- 3 Juvenile tabes
- 4 Microcephalus
- 5 Hydrocephalus
- 6 Cerebral aplasia and agenesis
- 7 Meningo-encephalitis
- 8 Spastic palsies, cerebral and spinal hemiplegia, diplegia
- 9 Epilepsy—Convulsions
- 10 Gumma—tumor

The subject calls to mind the laws of Colles and Profeta. Colles' law states in substance that a woman free of syphilis who gives birth to a syphilitic child is immune from infection by this child although the latter may infect another nonsyphilitic individual, for example, a wet nurse. Profeta's law states that a

nonsyphilitic offspring born of a mother infected with lues cannot be infected by the mother or syphilitic wet nurse while at breast. In the light of present day knowledge it is easy to understand the observations upon which these laws originated. We now know that many congenital syphilitics are symptom-free at birth and until several years later when they are diagnosed either by physical symptoms or by the aid of the Wassermann test. In like manner there is a small percentage of mothers who give birth to syphilitic offspring and show no physical symptoms of the disease. With the aid of the Wassermann test these cases are revealed. When the above mentioned laws were formulated there were no laboratory tests available to assist in making the diagnosis.

An intriguing problem arises when we attempt to explain why one of twins may be infected and the other remain free of syphilis. The majority of writers today feel that the infection is transmitted from the mother to the child through the placenta. Other theories which have been considered are the transmission of spirochetes to the ovum by spermatazoa, transmission by extension from mother to ovum, penetration of the ovum by independent spirochetes at the time of impregnation, and infection by trauma during passage through the birth canal.

In support of the belief that transmission from the mother occurs through the placenta is the observation that scarring^{2, 3} sometimes may be seen in the placenta of offspring who later prove to be congenital syphilitics. This finding is not present in all cases but wherever observed, it is practically always pathognomonic of congenital syphilis. Animal experimentation has shown that certain spirochetes such as the *spirocheta pallida*, *icterogenes*, and *recurrens* may pass through a normal

Read before the Utica Academy of Medicine October 15, 1936

The Chambered Nautilus he was filled with "the highest state of mental exaltation and the most crystalline clairvoyance" that had ever been granted him. And Dryden's borrowing of the famous line from Seneca—great wits are sure to madness near allied—is well-known.

The list of troubled writers reads like a roll-call of the great. Nisbet's book, Lombroso's *Man of Genius*, Albert Mordell's *Erotic Motive in Literature*, Jeanette Marks' *Genius and Disaster*, Hyslop's *Great Abnormals*—all abound in descriptions of the psychotic instabilities of writers. Burns, Byron, Shelley, Keats, Swinburne, left records of their troubled lives in their lyric poems. Swift, Johnson, Cowper, Southey, Goldsmith, Lamb, Landor, Chatterton, Coleridge, Scott, to mention but a few whose lives have been studied from this aspect, were decidedly troubled, decidedly pathological. In *Expression in America*, Ludwig Lewisohn applies the psychoanalytic yardstick to literature, with the standard of judgment that of Hawthorne, who wrote, "not by accident, but to ease his troubled soul." Intensive studies of this aspect of writing have been made by two psychiatrists. Fritz Wittels, in a chapter called *Psychoanalysis and Literature*, from the book, *Psychoanalysis Today*, and Otto Rank, writing on the Creative Urge and Personality Development, in his *Art and the Artist*.

Why, asks Albert Mordell, was Schopenhauer a pessimist? Why was Byron melancholic? Whence came the pathological passion of Keats for beauty, the spirit of Browning for optimism, the misogyny of Strindberg, the misanthropy of Swift, the moral revolt of Ibsen, the religiosity of Tolstoi, the cynicism of

Thackeray? Where but from some inner urgency. They write and live thus because they must, because they can do not otherwise. "All who flatter themselves that they do not write themselves into their works are the dupes of the most fallacious illusion," said Anatole France. Literary psychographs have been prepared of many of these writers, bearing out in every instance the thought expressed by Goethe to the effect that work is a deliverance. In *Hassan*, a play by James Elroy Fletcher, occurs this dialogue:

A poet must learn what man's agony can teach him.

Is it then not better not to be a poet?

It is undoubtedly true that mental warfare produced the visions of Blake, and De Quincey, and Baudelaire, and Coleridge. Psychiatry, and psychopathological literary criticism would seem to show that genius and psychosis are inter-related, that the works of men grow out of their mental torments which make their lives miserable "but produce masterpieces of strange and weird and lasting beauty." For it is highly probable, says E. Graham Howe, (*Lancet*, February 14, 1931) "that much that has been written and much that has been said would never have seen the light of day had there not been emotional repression behind it."

The analysis of these repressions does not constitute literary barbarism. The psychiatrist, by including his clinical notes in a study in literary criticism, is neither intruding nor besmirching. Rather, he is affirming with Matthew Arnold that "literature is the criticism of life."

110 OAK ST

CCC POSITIONS FOR DOCTORS

The United States Government has issued a call for physicians to assist in the medical work of the Civilian Conservation Corps camps throughout the eighth corps area, which comprises Texas, Colorado, Oklahoma, Arizona, and New Mexico. Applicants for these positions must be graduates of Class A Medical schools. If accepted, they will be given preference of assignments

in any one of these five states. Physicians without dependents will receive for this work \$200 a month and those having dependents will receive \$265 a month. All inquiries in connection with application for a position in the Civilian Conservation Corps work in the eighth corps area should be addressed to the Surgeon Headquarters, Eighth Corps Area, Fort Sam Houston.

was sent to the Utica State Hospital with a diagnosis of juvenile paresis

Patient is fairly well-developed and nourished. Tonsils infected. Upper central incisors show Hutchinsonian deformity, i.e., semilunar notching. Glands, bones, and skin negative. Heart, lungs, and abdomen were negative. Pulse seventy-eight, B P 90/70

Pupils react sluggishly to light but satisfactorily to accommodation. Right pupil is larger than left. She utters only a few words which are slurred, right external squint and horizontal nystagmus present, knee jerks normal, right ankle jerk not elicited, no Babinski or ankle clonus. No cooperation for sensory and other neurological tests

Blood Wassermann four plus in alcoholic and cholesterinized antigen. Spinal fluid Wassermann four plus in alcoholic antigen and 44420 in cholesterinized antigen. Cells two plus, globulin faint trace, pressure normal, colloidal gold 555432100, i.e., incomplete paretic curve. Blood sugar ninety mg per 100 c.c. of blood. Nonprotein nitrogen thirty-six mg per 100 c.c. Urinalysis—color amber, reaction acid, albumin one plus, sugar negative, few leukocytes, many epithelial cells, no red blood cells, or casts, some calcium oxalate crystals, spg 1.032. Patient's twin sister showed negative blood and spinal fluid Wassermann, also negative colloidal gold and mastic tests. All tests were performed at the George Alder Blumer laboratory, a unit of the Utica State Hospital.

Mental examination (for uncooperative patients). Patient was quiet and cooperated poorly. Production markedly diminished. Pronounced speech defect. She appeared happy, smiling frequently. Her movements were natural. No assuative tendencies were shown. Dressed and fed herself. Expression of face frequently vacant. Unable to follow commands or imitate movements of others. Muscle reaction normal. Smiled and appeared pleased when her home and mother were mentioned. No emotional response to jokes. Unable to read or write. Body temperature and skin reactions normal.

The diagnosis of syphilitic meningoencephalitis (juvenile paresis) was confirmed and this patient will receive a course of malarial therapy followed by weekly trypanemide and mercury salicylate injections at intervals of three or four days, dose 15 to 20 grams of the former and thirty to forty-five milligrams of the latter by the intramuscular route. Two or three courses consisting of twenty-five injections

of each will be given depending upon the patient's physical reaction to the treatment. During rest periods from the former she will receive mixed treatment consisting of potassium iodide and red iodide of mercury. Blood and spinal fluid examinations together with the patient's physical condition will govern the number of repetitions and any change of the medicinal routine.

One cannot hope for a cure in cases such as this but the treatment as outlined may prevent further progress of the disease, produce moderate general improvement, and permit the parents to care for the child at home.

In this connection some figures given by Campbell,⁹ obtained from the records of the Los Angeles maternity clinic, relative to the success of antepartum therapy in the prevention of congenital syphilis are interesting. I am taking the liberty to use Table I of his article which includes the figures mentioned in the accompanying table.

TABLE I

Therapy	Cases	Negative	Positive	Syphilitic
1st-3rd mo	70	69	1	1.42%
3rd-6th mo	143	131	12	8.39%
6th-9th mo	103	48	55	53.39%
Total	316			

These results most emphatically are an indication that syphilitic mothers should be treated early in pregnancy to prevent the occurrence of congenital syphilis. If a routine Wassermann were taken on all pregnant women and therapy instituted when necessary, the number of cases of this type would be reduced to a minimum.

Conclusions

1 Juvenile paresis may occur in only one of twins.

2 Such a phenomenon might be explained on the basis that in the case of the healthy twin a spontaneous cure has taken place *in utero*.

3 The prevention of congenital syphilis is best accomplished by early antenatal therapy.

4 A routine Wassermann should be taken on all pregnant women to prevent the occurrence of congenital syphilis.

placenta, but larger trypanosomes probably cannot⁴ Finally the fact that prepartum therapy is more successful than postpartum therapy has also been offered as proof⁵

In spite of this illuminating data the explanation for the occurrence of syphilis in only one twin still remains hazy, particularly in the case here reported, inasmuch as the twins, as far as can be determined are identical in character and therefore necessarily have the same placenta and originated from the same ovum Dennie⁶ in 1924 reported a case of lues involving the central nervous system of an identical twin which seems to parallel in many respects the one under consideration In cases like this it is the belief of some investigators that inasmuch as both offspring have been exposed equally to infection from the mother and one is free of disease, the latter must have developed an immunity to infection *in utero* We know that a certain percentage of acquired syphilis clears up of its own accord without treatment and the same mechanism by which this occurs might explain the negative findings for the healthy twin described in this paper

A word relative to the incidence of congenital syphilis as a whole may be apropos Solomon⁷ et al estimate by means of an average of figures obtained from hospitals in various parts of the United States and Europe that probably five per cent of children admitted to hospitals are afflicted with congenital syphilis The upper limit of these figures is twenty-two per cent, the lower 17 per cent He also states that the symptoms of congenital syphilis may appear at any age from babyhood through adult life, and that some congenital syphilitics go through life with hardly a symptom or sign In reference to cases similar to the one which I am reporting, he says further that juvenile paresis frequently develops in children who have shown no marked symptoms of congenital syphilis prior to the onset of those referable to the central nervous system He gives the average age of onset as fourteen years remarking however that cases are described in the literature as young as eight and as old as twenty-three Many of

these cases are mistaken for nonsyphilitic mental defectives

This report concerns identical twins, in one of whom there occurred juvenile paresis, the other being nonluetic. Such an incident as far as the writer has been able to determine is extremely unusual It is most common to see both twins infected or for both to escape infection rather than for one alone to be involved.⁸ These twins appear to be identical because they are both of the female sex, have the same facial features, and possess like coloring of hair and eyes The patient in question is smaller in stature than her twin sister, but this could be accounted for by the fact that she has had a chronic debilitating disease Accurate information relative to the type of placenta is not available The father states that he saw only one after-birth No record of this phase of the labor which occurred at home was kept by the attending physician

Case Report

N A, an Italian girl of thirteen, was admitted to the Utica State Hospital from the Rome State School for Mental Defectives, where the cause for her mental defect had been diagnosed juvenile paresis

Father learned of his luetic infection in 1913, and her mother contracted the disease in 1915 Her first, second, and fourth pregnancies ended in a miscarriage at the third, eighth, and second months respectively The third, fifth, and sixth pregnancies went to full term and the twins constituted the fifth pregnancy All the living children, of whom there are three, excluding the patient, have negative Wassermann tests

Patient was bottle fed and walked at fifteen months Parents state that she cut several teeth when nine months old which she lost before the age of two Had measles and mumps at ten Parents noted that patient was not as bright as the other children She entered the first grade of school at seven but made no progress She was therefore sent to a special class but because of the distance of the school from her home she did not continue to attend

She was admitted to Rome State School July 27, 1933 as a mental defective, where her blood and spinal fluid Wassermanns were found to be positive Intelligence tests performed classified her as an idiot She

"I am full of contempt for my utterly base and selfish attitude."

"The world around me has become one large motionless, meaningless canvass"

"In attempting to escape the monotony of the scene I try sleep, but it only refreshes my body. My mind feels like that of a deep sea diver"

"Feeling insecure and impotent to rectify the abuses of the world, I retired into myself and built an equitable world where I would be able to live. The other world was unbearable."

"I began very early, as a child, to hate my family, my surroundings and the world in general"

"I am behind a wall and I am timid and apprehensive of the dangers that lurk on the outside of the wall"

"Any show of friendship, the salutation of 'hello honey' or 'dear' from members of my family, sets my blood boiling"

"I know, I blame the world and the people for my internal conflicts"

"I went to a prostitute and her kiss on my cheek almost led me to smack her. All day after that I was in an ugly mood"

"The other day I was offered some candy by a girl. I refused with thanks. After sitting around fruit was placed on the table and I was offered some. Again I declined. Then the girl twitted me about my fear to accept anything as that would place me under obligation. Somehow she had struck the nail on the head. Always I had refused things and services for fear I would become obligated. I knew I would have to reciprocate the favor in one form or another"

"In all my dealings I was an honest man like Scrooge. Measuring and weighing every act for the benefit which might accrue to myself"

"I always paid more than my share because I couldn't bear to think of hurting my pride and vanity"

"I cannot work. Showing up in the shop is becoming a perfunctory affair. If I were offered a job I would try to get out of it."

"No sooner do I espouse some cause where sacrifice might be involved than something in me mocks my words. There isn't a thing in the world for which I would lay down my life or sacrifice anything"

"I went up to the old whore house. But the Spanish girl wasn't there. I prefer the Spanish girl because I feel superior to her. Therefore I do not fear her. There was another woman but I could not enjoy her because all desire had left me. I felt I had completely retired into myself. I

could have resurrected the dead rather than revive sexually. But when that happens my pride is not humbled. In street language, I can take it."

"It's funny how blind one can become to his own actions and thoughts. All my life I hated reformers and authority. Instead of looking into myself for the cause I hated the people."

"Like some people cannot handle their liquor I cannot handle my emotions"

"As a rule I cannot bear to feel inferior. I never go back to a situation where I feel that I have failed."

"I'm tired of being impersonal. It makes life too drab"

"One day is like another and apparently I have lost all ambition. Yet somehow the pressing problems of the day are getting due consideration. I take my undeserved money without doing anything in return. I accept the help without working, although I am physically, not mentally, able. I feel no repugnance, guilt or scruple. The moral problems have ceased to torment me. I have become insulated."

"In my dealings with people, though they may not notice it, I am partonizing and condescending"

"I crave friendship and someone to talk with. I crave praise like any child. I can have all these except for my mistrust, self-mistrust and distrust of others. I am invited to visit people, but I always refuse. I have a deep-seated fear of people. For days at a time there is movement of distress going on in me. I sit and stare at nothing. I try to sleep, but the thing that is bothering me never sleeps. I go down and walk the streets. I look at the posters of the movies but I have no desire to go in. It's tormenting to realize these things and be unable to do anything about them except wait until it has run its course"

"The conflict is within myself, but I make others act as the accusers. For instance, I sit in a cab and suddenly I begin to fear the cabman has a suspicion that I haven't enough money to pay him."

"I need a new tie, but there is something in me that doesn't care whether I dress well or not. It only wants excitement. I go in and choose a tie, but I don't know whether I like it or not. It's the same with everything I do"

"I am always tired and weary and can sleep fifteen hours at a stretch"

"I am always trying to impress people with my sophisticated outlook and making them aware of my boredom as though it were something to be proud of"

"Within me there is a living being that has lost contact with the outside world"

5 All mentally defective children should be regarded possibly syphilitic until a blood and spinal fluid Wassermann has proven to be negative

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, D R P H, New York City

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital. The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

How the Schizophrenic Speaks

One of the symptoms of *schizophrenia*—and its most characteristic symptom—is a tendency of the patient to become *separated from his environment*

There is a *schizoid* condition which is not yet *schizophrenia* and which is extremely spread everywhere among persons who are regarded as in adequate mental health, who are able to function and are more or less adjusted to their surroundings. A large part of what is usually called normal humanity has *schizoid* trends

The extreme cases constitute the developed mental disease called *dementia praecox*, which shows various degrees and forms

Between these states we have the large number of schizophrenics, met in all walks of life and by all *medical practitioners* without exception. They may come for their mental disturbance or for some physical or somatic complaint. If we are not able to solve their problems, if for therapeutic purposes we may need the aid of the specialist—which should generally not be the case—everyone of us should at least know and diagnose the disease and understand the patient's difficulties

This is especially important in the slightly advanced or *transition cases* where a study of the mental mechanism is quite feasible and a return to what is called normality is frequently still possible

The patient's speech is our greatest help in recognizing his condition. Just as there is a more or less typical physiognomy for

each mental disease group, so there is a sort of language physiognomy, as it were, which is particularly characteristic for *schizophrenia*. I am presenting, therefore, a series of hitherto unpublished quotations, as far as I know never assembled in this form, taken from my notes about their manner of talking, from some of their letters and diaries which, I believe, are all illustrations of the way in which the typical schizophrenics express themselves. These quotations should enlighten us about their thoughts and should explain their behavior. I have chosen intelligent and cultured individuals because their speech is more interesting than that of the illiterate and because it clarifies their chief cause for maladjustment, their separation from the rest of the world

The examples of the light cases are followed by those of the more advanced and, as a contrast, I am giving at the end some instances of the most deteriorated cases

Here is how the ordinary schizophrenic speaks

"Strange how all desires have left me!"
"I always felt I was incompetent and my employer was overpaying me."

"I'm never worried in the least as to the consequences of my actions"

"Some deep change is coming over me"

"I am at a loss what to do with myself"

"The whole world has been uniform and timeless. Everything appears remote. Inside of myself I am developing confidence"

Read before the East Flatbush Medical Society, Brooklyn, January 6, 1937

SERUM IN PNEUMONIA

That the physicians of the State may have concrete examples of different phases of anti-pneumococcus serum treatment of pneumococcus pneumonia, there will appear here case reports selected from the large number received by the State Department of Health on the use of anti-pneumococcus serum produced and distributed by it

In order that physicians practicing in New York City or those using effective serum from other sources may also be represented, we hope that physicians who may have had particularly significant experiences with serum will submit short reports to the Pneumonia Editor, New York State Journal of Medicine, 33 W 42 Street, New York City—Editor

Case 4—Aborted Pneumonia

Report from the records of L. R. Smith, M D, Watertown

"Mr N, a white laborer, age thirty-five, was first seen January 5 at 12 00 mid-day in bed, acutely ill. A history was obtained of a head cold of one week's duration. On the morning of January 5 while at work, he was taken with a severe chill at 9 30 A.M. which lasted about an hour. He returned home and during the interval developed headache, generalized pain in back and limbs, and sharp pain in his right chest associated with breathing.

"Examination revealed temperature of 104.2 (oral), respirations thirty, pulse 120. The breath sounds over the right upper lobe were distant. Otherwise, the chest was negative and there was no other relevant physical signs of significance.

"A good sputum specimen, which was definitely from the lung, was collected and sent to the laboratory. It was examined by the Neufeld method and the presence of Type I pneumococci was reported.

"The patient gave no history of previous serum administration or allergy and the intradermal test with diluted horse serum proved negative.

"Twenty c.c. (25,000 units) of Type I antipneumococcus serum (New York State Department of Health) were given at 6 30 P.M. (January 5) and the dose repeated again at midnight. The serum was undiluted and in both instances well-tolerated.

"The following morning the temperature was normal and remained so thereafter. Physical signs receded and the convalescence was entirely without event. The patient was discharged from my care one week later."

Dr Smith, in reporting this case, stated that in his opinion, the pneumonia had been aborted before the parenchyma of the lung had had an opportunity to become grossly involved. Indeed, the evidence submitted by him entirely supports this contention.

This case illustrates in a striking manner the usefulness of early serum therapy in the so-called abortive cure of pneumonia. The evidence in this instance supporting

the diagnosis of pneumonia must be considered quite irrefutable as must be the efficacy of the therapeutic measure employed.

It is also worthy of note that this case was promptly and adequately treated in the home without the benefit of hospital equipment and assistance.

Case 5—Serum Treatment of an Asthmatic Pneumonia Patient

Report from the records of John H Stauffer, M D, Canton

"B H, a fifty-nine year old Jewish male, was seen early on the morning of November 23 at his home to which he had been brought after having been found in the street the preceding evening in a completely disoriented condition.

"He complained of severe pain over the lower portion of the right chest posteriorly and extending into the right axilla. He was cyanotic and dyspneic, respirations being labored and asthmatic in character and was raising sputum which was frankly bloody.

"Examination revealed a temperature of 104, pulse 140 to 150 but of good quality, and respirations of 32 to 40. There was dullness to percussion and diminution of voice and breath sounds over the right base extending into the right axilla. Moderately coarse rales were heard over the same area. The upper portion of the right lung and the entire left lung showed typical asthmatic expiratory wheezes and sonorous rales.

"The patient was admitted to the hospital about noon of the same day. Sputum examination showed Type I pneumococci. During this period, he had been given intravenous glucose and adrenalin for relief of his asthma.

"A history obtained from his family revealed that he had had severe bronchial asthma during the fall, winter, and spring months for the past six years and that the condition was usually greatly aggravated by any respiratory infection.

"A skin test with diluted horse serum

"I have contempt for most of the thoughts of the average person I meet."

"Everything I do is with an aloof and reserved manner. I treat people with extreme courtesy and act as though I were to the manor born. It simply is a trick to cover up my shyness and feeling of insecurity."

"Nothing seems to interest me. I am bored to death."

"I am fighting in the dark with phantoms. I feel more sure of myself only when my moments of doubt assail me. The apparent lifelessness around me sends my heart throbbing like an airplane motor."

"I am cut off from everything and unable to rely upon this world."

"Before going to sleep I feel sad, unreal."

"Life is but a passing phase. I am fast asleep and afraid to wake up."

"I feel like a spirit who would like to talk to people but can't."

"I could go to the world's end and not get a thrill out of it."

"I try to think clearly, but there is something blocking my thoughts and memory."

"How I would like to tear aside the veil that stands between me and life!"

"While everything around me seems unreal yet the movies which are unreal appear to be the only thing that is real. They are clear and distinct. I have no veil before my eyes. I enjoy it. I laugh at the same time as all the people around me, *which I rather resent*."

"I must find a way to break down my inability to get in touch with life and live like other people."

"When I see and hear some of the idealists who live in their fantasies I have a hint of myself."

"I can't break through and act human."

"The world and the people appear like disembodied entities."

"I can't understand my shying away from people."

"I'm in a raging mood, yet I don't know why I am disgusted."

"I can't find anything to say to people and I'm tormented by doubt."

"The talk of politics, unionism and everything relating to the realities of life don't interest me in the least."

"I am trembling inwardly. I can't penetrate. I feel as though I had lost the element of time. I don't want to act in any manner, form or shape."

"Yesterday in the restaurant everything became gray, filmlike, indistinct, and unreal."

"I would like to sleep with a woman

for a whole night to see what effect it would have on me. Perhaps it would shed some light on my present *reluctance to have anything to do with them*."

"I am unable to express my thoughts even to myself."

"I am looking for something, I don't know just what."

"I feel an indifference and unconcern, yet an insistent demand that something be attended to. The world appears dead but inside of myself I am alive."

"I am leaving the inevitable consequences for some one else to shoulder. That is what I call cheating in life. And that is what I feel guilty of. There are others who do the same thing, but they do not see it so clearly because they are actors while I am *a spectator*."

"That strange unease and fear has me again in its grip. I don't understand it but in a *dim* way."

"My mind feels as though a *wall* blocked it off from its conscious self. I talk to people with never any assurance that I will be able to carry on my end of the conversation. Many times I answer in monosyllables because I don't know what to answer—because of this *cutting off*."

"A something other than my intelligence has the power to overwhelm my intelligence and make me *retreat into myself*."

"I am tongue-tied, memoryless, feelingless in the sense of some kind of paralysis."

"I have neither the confidence, ability, courage, stamina, perseverance and memory to hold down a job in competition with others."

"I doubt whether I will ever get out of this condition so as to participate in the world's work."

"I can't understand the desire to peep at women's breasts on every occasion when I see them dressed. Yet when I see them nude and exposed they don't mean a thing to me."

"If people found out what I really am I would be ostracised, boycotted, chased and denied all privileges that go with communal life" (A desire).

"When conversing I am making use of my old trick of becoming intensely interested in people, finding out their viewpoint in life, all the places they have visited, and then discarding them like the rinds of an orange."

"Everything was bleary and almost appeared like a hallucination."

"The world and all its activities become *bizarre and distorted*."

"I act as though there was nothing to worry about."

Flirting with Osteopathy

There appears to be a high degree of organization in the current legislative courtship of osteopathy. Simultaneously at Washington and Albany politicians are laying statutory offerings at the feet of the osteopaths.

In the National Congress a bill has been proposed which would place osteopaths in the same category as physicians and surgeons. Neither osteopathic theory nor osteopathic education warrants a measure of this kind.

If osteopaths desire to practice medicine and surgery, they should abandon sectarian dogma and take the medical course. They cannot give their professional allegiance to a single principle of limited applicability and expect the right to practice medicine, with its great catholicity. As long as their training falls short of the physician's rigorous preparation, legislators will find it difficult to justify extension of their prerogatives.

On the basis of merit, the Judiciary Committee should make short shrift of the Drew Act. However, one of the members of that Committee is Congressman William T. Byrne, who has sponsored several osteopathic bills in New York State. It will not be surprising if he makes a stand for the Drew measure, so physicians must prepare for a sharp fight.

In New York the situation is no less disquieting. Assemblyman Milmoe will sponsor an osteopathic bill which the Board of Regents has approved without consulting the medical profession. This is contrary to the best traditions of the State.

The standards of medical practice have reached an exceptionally high plane in New York. One reason for this is the splendid cooperation which has existed between organized medicine and executive agencies of the state for the past fifteen years. The action of the Regents in endorsing a quasi-medical bill without consultation with the medical profession violates this accord. It is a blow to the public health from an unexpected quarter.

Periodic Health Examinations in Industry

There is no group that is more actively engaged in propagating the knowledge of what preventive medicine means than our own group of organized medicine. We first convinced our individual members of its desirability, then afforded courses and lectures for their training in this field and only then began the education of the public to avail itself of preventive medicine as a method of promoting health and prolonging life.

(1-100) was done carefully and observed to be negative. An ophthalmic test with horse serum (1-10) was also negative. In view of these negative tests, forty cc (50,000 units) of Type I antipneumococcus serum (New York State Department of Health) were administered with considerable caution at about 4 00 P M, approximately twenty-four hours after the onset of fever. The serum was given undiluted and was well-tolerated. Small amounts of adrenalin, however, were given at fairly regular intervals for the asthmatic condition.

"At 11 00 P M a second dose of 50,000 units was given. This was again preceded by skin and ophthalmic tests for horse serum sensitivity, both of which were negative.

"During the night and the following morning there was marked improvement in his general condition. From that point on his recovery, though gradual, was steady and at the end of a month his lungs had entirely cleared.

"It is of interest to note that during a period of two months since his recovery, he has remained entirely free of his usual asthma."

This case was selected for publication because it illustrated the successful administration of serum to a patient who not only gave a history of asthma but who was suffering from severe asthma at the time. This case, therefore, brings up several points of interest.

While the occurrence of bronchial asthma is not to be considered as definitely contraindicating serum therapy, it has long been recognized as an indication for considerable caution in its administration. The

precautions used in this case of employing both the intradermal and ophthalmic tests were, therefore, well advised.

It is possible to speculate in this connection that, when sufficient material is available upon which to base conclusions, it may be found that the type of asthma is of some importance. That is to say, between the danger to a case of extrinsic asthma or that to a case of intrinsic asthma, such as the case cited, the latter may represent the safer group.

It is also interesting to note that "small doses of adrenalin" were given at regular intervals before and during serum administration because of the asthma. One judges that no definite change occurred during the serum administration which suggested a reaction and yet it is possible that without the use of adrenalin it might have occurred.

The general question of serum treatment in the face of a history indicating sensitivity or of a strongly positive skin or eye test is occasionally one of extremely difficult decision. Certainly, no rules can be made which would apply under all circumstances. The question, therefore, becomes one of pure judgment in which the chances of recovery untreated must be balanced against the risk of a serum reaction. In a case as obviously critically ill as the one presented or in the presence of a positive blood culture, the prognosis without the use of serum can, perhaps, be considered poor enough to justify serum treatment even though there be some danger attached to it. Such risk should only be undertaken, however, with the full understanding and consent of the patient's family as in the case of a major operation.

FRESHMEN ARE TALLER, HEAVIER, YOUNGER

In making a yearly average of the height, weight and age of 8,964 young men and 4,124 young women entering the University of Cincinnati from 1916 to 1935 Laurence B. Chenoweth, Cincinnati (*Journal A.M.A.*, Jan 30), finds that the results show that freshmen are admitted at a younger age now than they were twenty years ago. Freshmen are taller and heavier today than they were twenty years ago, in spite of their younger age. Judging from evidence from the past, mankind in civilized countries is steadily growing taller. There is no definite answer to the question of what causes this to be true, but the probable

causes of the increase in stature and weight of young people are better nutrition in infancy and childhood, less communicable disease, higher standards of living, and a higher degree of health intelligence among people in general. Undoubtedly those who have contributed most to this state of affairs have been physicians (especially pediatricians), nutritionists, public health workers and educators. Studies in the end product of the public schools (college freshmen) seem to indicate that a definite racial betterment is taking place, and that the improvement is only partially influenced by social and economic position.

Apply this test to the mortality rates of England, Scotland, Wales, and the United States, as Dr Hoffman has done, and what do we find? Vital statistics fail completely to support the claims made for compulsory health insurance as to the value of medical benefits to the insured. There has been no corroborative decrease in deaths in insured countries, even from diseases most subject to human control.

Since generalizations rarely satisfy, let us examine some of the actual statistics. The latest year for which official figures are available is 1934.

In England and Wales the mortality rate from erysipelas—an infectious disease which can be controlled by prompt, efficient medical care—rose from 26 in 1930 to 36 in 1934. The United States showed a drop from 21 to 15 for the corresponding period.

The cancer death rate for England and Wales in 1934 was 156.3 per 100,000, as compared to 106.3 in this country.

For rheumatic fever—also a condition in which careful medical supervision and prompt attention tell—the English death rate declined from 38 in 1930 to 34 in 1934. The same four years in America showed a decline from 25 to 18. Climatic factors alone do not account for this—or the fact that chronic rheumatism increased in England and Wales while the rate for this country remained stationary.

The 1934 death rate for anemia-chlorosis was less than half in the United States what it was in England. Furthermore, the English figure represented an increase while the American showed a decline.

Taking twenty-six important causes of death, in all but eight England and Wales led this country in mortality. Out of forty-two common causes of death, thirty-two were less prevalent here than in England and Wales. Statistics for Scotland accentuate this picture. Not only death and morbidity rates, but the rate of mortality decrease, proclaim the superiority of the American system to

the medical benefits obtainable under compulsory health insurance.

Do the people of the United States desire to exchange its morbidity and mortality rates for those of countries depending on compulsory health insurance for medical service? There can be only one answer, in view of our preponderantly more favorable vital statistics.

Before the Legislature takes action on the Neustein Act, it should weigh the convincing, unbiased testimony in Dr Frederick L. Hoffman's review of "Compulsory Health Insurance and Disease Control." To facilitate the distribution of this valuable data, the Public Relations Bureau of the Medical Society of the State of New York has made the booklet available to those interested.

Features of the Section Meetings in Rochester

The discussions and the presentations of the section meetings of our State Society have been distinguished in the past for notable contributions to the advancement of the science and art of medicine. This year, there will be no exception. For example, Dr W. R. Campbell, a distinguished member of the clinical research workers of the Faculty of Medicine, Toronto University, will present the latest experiences and conclusions relative to the use of protamine zinc insulin. This is vastly important to the practicing physician, because the topic of protamine insulin is so new, and rapid changes have come in both the original product and its modifications that even the published literature has lagged behind achievement. Dr Campbell's presentation will be found intensely practical, and the visiting physicians can take a valuable therapeutic remedy home with them so as to better handle the diabetic patient.

Polycythemia, sometimes described as "Vaquez disease," or "Osler's disease," and not infrequently termed "Vaquez-Osler disease" is a strange and unusual malady. Assuming that there must be a mechanism whereby the production of

In some phases, the effort put forth has been more than repaid in the results achieved. The reduction of the number of contagious diseases by immunization, the earlier recognition of the precancerous states and of incipient cardiac disease, and the avoidance of a large number of industrial diseases are but a few of the notable milestones. But preventive medicine must be carried further. It must and can eliminate a great many catastrophes that are the result of conditions under which men work.

The worker in the stone industries assuredly can be spared the dread of silicosis by repeated physical examinations. Workers in compressed air should be examined before being engaged to ascertain the status of their ears and hearing so as to obviate the aggravation of any impairment that might already exist. Other industries have their problems which, in a large percentage of instances, could be solved by the efficiency of periodic examinations. In this aspect of our program there are other elements which play a role in hindering our progress. An individual, knowing he has a defect which would prevent his getting employment in his field, might object to a voluntary examination. Labor organizations erroneously might feel that employers requiring complete physical examinations were discriminating against their members.

A study should be made to formulate some means whereby our great body of workers can be protected against the medical diseases attendant upon industrial pursuits to the same extent as they are guarded against surgical accident. Whether a compulsory periodic physical examination is the answer remains to be seen.

New York State Red Cross Highway First Aid

The increasing number of highway automobile accidents, prompts consideration of a problem which is local as well

as national. The burden of caring for these accident cases falls upon localities and physicians immediately and during convalescence. The economic set-up is a problem to both physicians and communities. Were these accidents financed by personal, national or interstate insurance, the burden on both physician and community would be small. Unfortunately this happens not to be the case, and until some form of relief is established First Aid on the highways remains a problem which must be met.

In Belgium, France, and even in Germany, the Red Cross societies handle this first aid, because based upon the experience gained in the last war, correct first aid procedures applied early by those trained to administer it, saves much pain, disability, time, and money in convalescence.

In America, our Red Cross has taken up this tremendous problem, and without expense to the physicians, has undertaken to establish on our highways, First Aid Stations equipped with supplies for emergency work. At these highway stations, there will be trained medical personnel.

Every citizen driving an automobile should have knowledge of First Aid procedures, and it is suggested that this be an added requirement for securing a driver's license. Teaching this emergency First Aid should be a duty of physicians. The local chapters of the Red Cross in this State should energetically undertake this work with the hearty cooperation of the profession. We bespeak support of the scheme to the end that the hazards of travel on our highways be lessened.

The Ultimate Test

"The death rate is the ultimate test of skill and attention in medical practice." So speaks common sense. So finds Dr. Frederick L. Hoffman, for forty years Vice-President and statistician of the Prudential Insurance Company.

orable reports has appeared in the literature concerning this mode of treatment. The sulfonamide has, to a large extent replaced the azo dyes because the absorption of the former from the gastrointestinal tract is better than that which follows the intramuscular injection of the azo substance.

In experiments directed toward the investigation of the mode of action of the sulfonamide, Colebrook, Buttle, and O'Meara¹ found this drug to possess a bacteriostatic and bactericidal action against small numbers of hemolytic streptococci in culture medium and in blood. It was further established that the blood or serum of human beings and monkeys, taken after the administration of the dye had a bacteriostatic and bactericidal action against hemolytic streptococci greatly in excess of anything encountered in normal blood or serum. The authors believe that this may prove to be the decisive factor in the therapeutic activity of this substance.

Clinically the administration of the sulfonamide at present is recommended for the treatment of virulent hemolytic streptococcal infections. It is still too early to pass any decisive opinion as to the efficacy of this therapeutic agent. Too short a time has elapsed since its employment in humans for a full knowledge of the beneficial effects as well as the untoward ones to have been acquired. In the meantime it is better to proceed cautiously and not abandon the established modes of antistreptococcal therapy which, up to the present have yielded good results, until more is learned of this new remedy.

CURRENT COMMENT

FROM THE *New York Times* of March 7, we learn that "The Merchants Association of New York announced *** yesterday its opposition to the proposed Health Insurance Law on the ground that it would increase the 'menace of governmental competition par-

ticularly in a field now adequately and ethically served by private enterprise'."

"The association asserted that 'imposition of additional tax burdens on employers and employes for so-called social-security purposes, at a time when the payroll taxes imposed by the Federal and State programs now in force are already assuming burdensome proportions, serves but to increase the folly of even seriously considering enactment of the measure * * *'"

"BY ALL WORKING TOGETHER toward a common end we should be able to improve medical education hospital care and post-graduate medical instruction in the United States and thereby do more than could be done in any other way to improve the private and public health of the future"—Dr Ray Lyman Wilbur is herewith quoted from a paper which he read before the Thirty-Third Annual Congress on Medical Education and Licensure in Chicago on February 15.

"AMERICANS HAVE BECOME IMBUED with the idea that to choose their own physician was a God given right. Europeans are glad to accept whatever was given them by overlords and know that it is useless to protest"—A statement by the *Saint Louis County Medical Society Bulletin*.

'IGNORING FOR THE MOMENT many secondary meanings, science may be defined as the classification and coordination of factual knowledge, art as the utilization or application of knowledge to accomplish desired results. In the former case, knowledge is static, in the latter it is dynamic *** Medicine is both an art and a science. Any comparison as to relative importance would be invidious. Whether consciously or unconsciously, the physician in the pursuit of his daily duties must needs be an exponent of art no less than of science. Realization of this truth should be an inspiration as well as a constant incentive."—Dr A B Cooke, writing in *California and Western Medicine* for February, brings to mind once more something that the "socializers" always seem to overlook.

' *** OUR INDEFENSIBLE SLUMS and our inadequate building industry have long been with us, but have been generally recognized only in the last few years. Whether the incidence and recognition of these factors will fuse into a determination to meet

¹ Colebrook, L. Buttle, G. A. H. and O'Meara
R. A. Q. *Lancet* 2 1323, 1936

red blood corpuscles and hemoglobin is permitted to replace ordinary wear and tear, or to rapidly regenerate unusual losses, this disease has been thought to be a disturbance either of one or both of the controlling influences in the production of the red corpuscles and the hemoglobin. Dr Kenneth R McAlpin will present some new aspects of the problem this disease presents. Dr David F Gillette of Syracuse will present a study telling of the management of intraocular foreign bodies. The value of the report is obvious. Dr Ralph Almour of New York, one of the pioneer workers in the development of the therapy of petrositis, will differentiate for the clinician progressing cases from those undergoing regression. The whole topic of petrositis is so new, its clinical import not yet generally appreciated by general clinicians, and the scientific articles still in the state of intense discussion, that a clarification of the cases urgently demanding operation from those which are in process of spontaneous healing, will make a notable contribution to our general knowledge.

Dr Harry K Tebbutt, Jr of Albany experimented upon twenty immature male, and twenty immature female monkeys, and will report on his observations on the effect of the male hormone upon the nasal mucosa. There is no more difficult situation to be met with in practice than the management of acute pharyngeal stenosis. This topic will be presented by Dr Roy S Moore of Syracuse. The experiences of a psychiatrist in the Police Court by Dr Richard C A Jaenike of Rochester should prove an interesting clinical study. It embraces about one thousand cases of persons who were accused of one or other crimes against society. With a study of the public health aspects of Mental Hygiene by Dr Frederick W Parsons, of Albany, these two papers alone would make worthwhile a visit to the section of Neurology and Psychiatry. The critical estimate of the experience at Stony Lodge with the hypoglycemic therapy of psycho-

sis by Dr, Bernard Gleuck, of Ossining-on-Hudson, adds another outstanding feature.

In urology, Dr Meredith F Campbell of New York City, presents a study of a rarity urogenital tuberculosis in infants and children. This study is completed with the presentation of the indications and the contraindications to surgical treatment. Drs Ernest M Watson and Carl J Leutenaggar of Buffalo report on the remote primary manifestations in urinary tract malignancy. They are particularly stressing cases where the usual, common picture is absent and in its place certain bizarre, nonurologic symptoms become apparent. This presentation should not be overlooked by physicians desiring to educate themselves further.

Naturally, we cannot note and comment upon every theme upon this exceptional program which Dr William A Groat and his associates have assembled. We do not doubt that were another to cull its contents and its list of proffered papers, that perhaps another would have selected other items to stress. Naturally too, we are each impressed with what strikes us particularly. We say this in explanation of the many other papers to be presented at the various scientific sessions of the Rochester meeting, upon which we have neither space nor time to comment now. Upon this however, we can all agree, namely that the program given for our instruction by Dr Groat is truly of exceptional scientific value, and we may, without reservations, congratulate him and his associates at their success in devising so much for our continuing medical education.

Chemotherapy of Hemolytic Streptococcal Infections

Following the original chemotherapeutic success against infections caused by hemolytic streptococci¹ with the use of the complex azo dyes, a series of fav-

¹ Domagk, G. *Deutsche med. Wchnschr.*, 61, 250 1935

orable reports has appeared in the literature concerning this mode of treatment. The sulfonamide has, to a large extent replaced the azo dyes because the absorption of the former from the gastrointestinal tract is better than that which follows the intramuscular injection of the azo substance.

In experiments directed toward the investigation of the mode of action of the sulfonamide, Colebrook, Buttle, and O'Meara¹ found this drug to possess a bacteriostatic and bactericidal action against small numbers of hemolytic streptococci in culture medium and in blood. It was further established that the blood or serum of human beings and monkeys, taken after the administration of the dye had a bacteriostatic and bactericidal action against hemolytic streptococci greatly in excess of anything encountered in normal blood or serum. The authors believe that this may prove to be the decisive factor in the therapeutic activity of this substance.

Clinically the administration of the sulfonamide at present is recommended for the treatment of virulent hemolytic streptococcal infections. It is still too early to pass any decisive opinion as to the efficacy of this therapeutic agent. Too short a time has elapsed since its employment in humans for a full knowledge of the beneficial effects as well as the untoward ones to have been acquired. In the meantime it is better to proceed cautiously and not abandon the established modes of antistreptococcal therapy which, up to the present have yielded good results, until more is learned of this new remedy.

CURRENT COMMENT

FROM THE *New York Times* of March 7, we learn that "The Merchants Association of New York announced *** yesterday its opposition to the proposed Health Insurance Law on the ground that it would increase the 'menace of governmental competition par-

ticularly in a field now adequately and ethically served by private enterprise'.

"The association asserted that 'imposition of additional tax burdens on employers and employes for so-called social-security purposes, at a time when the payroll taxes imposed by the Federal and State programs now in force are already assuming burdensome proportions, serves but to increase the folly of even seriously considering enactment of the measure * * *'."

"BY ALL WORKING TOGETHER toward a common end we should be able to improve medical education hospital care and post-graduate medical instruction in the United States and thereby do more than could be done in any other way to improve the private and public health of the future"—Dr Ray Lyman Wilbur is herewith quoted from a paper which he read before the Thirty-Third Annual Congress on Medical Education and Licensure in Chicago on February 15.

"AMERICANS HAVE BECOME IMBUED with the idea that to choose their own physician was a God given right. Europeans are glad to accept whatever was given them by overlords and know that it is useless to protest"—A statement by the *Saint Louis County Medical Society Bulletin*.

'IGNORING FOR THE MOMENT many secondary meanings, science may be defined as the classification and coordination of factual knowledge, art as the utilization or application of knowledge to accomplish desired results. In the former case, knowledge is static, in the latter it is dynamic. *** Medicine is both an art and a science. Any comparison as to relative importance would be invidious. Whether consciously or unconsciously, the physician in the pursuit of his daily duties must needs be an exponent of art no less than of science. Realization of this truth should be an inspiration as well as a constant incentive."—Dr A. B. Cooke, writing in *California and Western Medicine* for February, brings to mind once more something that the "socializers" always seem to overlook.

'*** OUR INDEFENSIBLE SLUMS and our inadequate building industry have long been with us, but have been generally recognized only in the last few years. Whether the incidence and recognition of these factors will fuse into a determination to meet

¹ Colebrook, L., Buttle, G. A. H. and O'Meara
R. A. Q. *Lancet*, 2 1323 1936

the whole problem in a reasonably integrated way, or whether we shall allow it to drift along in the haphazard hands of the speculative builder remains to be seen ***

"Conceivably the time may be near at hand when, in the characteristic American way, we shall suddenly dart forward at a given moment and begin to cope with an accumulated situation which elsewhere would have been coped with in a more concerted, gradual way. Bills are being introduced in Congress and in the State Legislatures to give public housing a permanent status *** Generally speaking, neither public nor private housing has yet reached really low-income groups ***"

"The whole housing problem * * * takes two immediate forms. How much public low-rental housing shall we get in the next period of prosperity and boom? Will the housing at whatever level be the same speculation helter-skelter product that had to be rescued to the tune of billions in the last depression, or will it begin to measure up to our acquired knowledge in planning, in technique, in social stability and usefulness?"—The medical profession has always had an interest in the housing problems of the nation, and "The Nation Again Weighs A Vast Housing Program" is a timely article by Albert Mayer on the subject, from which we have quoted above. *The New York Times Magazine*, March 14

TO ROUND THEM UP YOUNGER

A step to supplement the annual summer health round-up of pre-school children sponsored by the National Congress of Parents and Teachers—the promotion of periodic medical examinations for infants—was adopted on Jan 11 by the advisory committee

The recommendation, to be acted upon in May at the annual convention in Richmond, Va., was the major item in the 1938 health program planned for 25,000 local parent-teacher associations. The summer round-up aims to teach parents the importance of periodic health examinations for children about to enter school

Local associations canvass communities to locate children of pre-school age, urge parents to have the children examined and check up in the fall to learn if physicians' advice has been carried out.

Under the proposed plan the summer program will be continued, but member locals will be urged to encourage medical and dental supervision of children from one to five as well

The goal of the health project, it was pointed out, is the development of a permanent community program under the leadership of official health authorities

THE "RESERVE LINE OF DEFENSE"

The Woman's Auxiliary to the State Society was organized on March 11 of last year, and "we are very proud to report 11 county auxiliaries, with a membership of approximately 800," writes Mrs John L. Bauer, its President. She adds

"We are slowly and surely progressing. We are informing ourselves on legislative matters, on Public Health questions, and on Preventative Medicine. At the same time, we are meeting socially, becoming acquainted and making closer friendships. These things are happening in County Auxiliaries

"However, we are also coming together in executive sessions as a State Auxiliary with representatives from all eleven county auxiliaries—exchanging ideas, comparing problems—(and solving some, too) with an enthusiasm that is amazing. There is an earnestness of purpose that presages well the powerful force such a band of clear thinking, informed doctors' wives can be in forming a reserve line of defense, alert and ready to be called upon to help combat legislation inimical to Organized Medicine."

The re-election of Dr Donald B. Armstrong as President of the National Health Council was recently made public. Other officers re-elected were Timothy N. Pfeiffer, Vice-President, Dr Maurice A. Bigelow, Secretary

It was announced also that the American Red Cross and the Maternity Center Association have become Active Members of the National Health Council. The Red Cross has been an Advisory Member for a number of years

Lymphogranuloma Venereum as a Cause of Rectal Stricture

562 W 164 St
New York City

To the Editor

In reference to the article by Kassebolin and Schreiber, "Management of Labor Complicated by Rectal Stricture" which appeared in the issue of this JOURNAL on March 1, may I make the following observations

The very fact that the material gathered for this article came from a hospital having mainly colored patients, the nature of the pathology described, namely rectal stricture, should focus one's attention on a disease which at present is attracting comment from many observers all over the world, a disease which is perhaps a great deal more widespread than we have been led to believe, namely lymphopathium venereum or Frei's disease. By a strange coincidence, this article precedes directly one by Dr Boris A Kornblith, whom I had the privilege of observing do some original work on this disease at Mount Sinai Hospital

It is not my purpose to describe the disease in this communication, but merely to point out some important facts which appear in the article above mentioned, but which were apparently not correctly evaluated.

Lymphopathium venereum appears most frequently in women, especially in negro women, and results in inflammatory processes, abscesses, and scarring of the superficial and deep lymphatic chains in the inguinal area and in the pelvis. In the female, rectal strictures are usually secondary to a primary lesion situated either in the vagina or cervix. This is frequently the only clinical manifestation of the disease. In females the lymphatics drain from the vagina and cervix into the perirectal glands, and result in rectal lesions such as proctitis and stricture. Such lesions may appear as early as six weeks after the onset of the primary lesion, or come on insidiously, as a fibrous stricture without any apparent discomfort many years after the primary lesion.

The authors state that "the etiology of rectal stricture is debatable." In view of

our present and increasing knowledge of lymphopathium venereum, I beg to take issue with them in this point. Apparently no Frei tests were done in their series of cases, although Wassermann tests were done routinely and found positive in thirty-eight per cent. Until recently syphilis was thought to be the cause of rectal lesions such as stricture, and the presence of a positive Wassermann in thirty-eight per cent of these cases is undoubtedly a coincidental finding and not the etiological factor in the causation of the stricture. I have no doubt but that most of the eighteen cases, if not all, were cases of lymphopathium venereum. An excellent opportunity was lost to observe this disease as a complicating factor in pregnancy.

It seems to me that in a hospital dealing mainly with patients of the colored race, Frei tests should be a routine measure, and in this way we will be able to increase our knowledge of a disease which was first described by Chassaignac in 1859, and to which very little has been added until only recently.

Very truly yours,

HARRY W ROTHMAN, M D

Prescribing

144 E 36th St,
New York City

To the Editor

I have noticed recently more or less discussion concerning druggists and prescription work.

As had been said druggists have told me frequently of the type of prescribing so prevalent today referring to the use of proprietary preparations and many times of evidence of too little training in the proper technic of writing a prescription. I am not posted on the amount of time that is given to this very important part of the medical students training in these days but I do know that there was entirely too little in my day.

My father was a graduate of the University of Edinburgh, Scotland and I learned most of it from him. In his time the course was five years and not only were students taught the subject didactically but every student had to serve an apprenticeship of six months in a pharmacy before he could obtain a degree. At his suggestion I spent a good deal of my spare time when an intern in the drug shop learning the subject practically. Can we improve this branch of the medical art in some such way?

Very truly yours,
H WALLACE, MD

Electrosurgery not Coagulation

64 E 87 St
New York City

To the Editor

Last night while attending a meeting at the Academy in memory of the pioneer Dr Frederic de Kraft, who developed the High Frequency Currents in this country, my attention was called by several confreres to an article of correspondence which appeared in the March 1 issue of our JOURNAL.

The letter first comments upon the dissertation of Dr Joseph D Kelly on the subject of the "Present Status of Electric-Coagulation," congratulating the author upon his biased stand in ignoring any of the accepted virtues of the electrosurgical tonsillectomy.

It is most unfortunate that so blatant and emotionally unsound criticism should come at this late date from one who has had many opportunities to verify the perfect end-results of a properly performed electrosurgical tonsillectomy.

We, who have spent years in controlled, scientific, investigation on this subject, (and there is no small number of highly intelligent and capable investigators) have long discarded the sole use of electrocoagulation for the complete extirpation of any tissue. A modification of coagulation is essential to obtain the very purpose of electrosurgery, which is the prevention of shock and hemorrhage.

Almost a decade ago, I demonstrated the perfect end-results obtained in a large group of patients at one of the Academy Meetings. Since then many informed operators have confirmed my findings. It was the late Dr McKenzie, emeritus professor of Otolaryngology at the University of London, author of a volume on the subject of "Diathermy in Otolaryngology" who made the statement

that, "The diathermy extirpation of tonsils will come to the method of choice in the removal of tonsils in adults. It may be of interest to note here that the largest and most thorough clinic in our country employs the electrosurgical follow-up one year after the completion of the orthodox surgical tonsillectomy."

Having had the pleasure of performing the electrosurgical tonsillectomy on a large group of our confreres, and some were otolaryngologists themselves, I wish to state for the benefit of those less erudite or perhaps misinformed, that the electrosurgical tonsillectomy is a most helpful adjunct in our field of otolaryngology. Mastery of the modified coagulation technic is more difficult than the simpler dissection and snare methods now in vogue, in our orthodox surgery.

You now have at hand an article, accepted some time ago for publication, on "The Control of Pain and Hemorrhage in the Electrosurgical Tonsillectomy," which would help to clarify any misunderstanding in this newer field.

Trusting that this cursory explanation may help to exonerate those of us who "have knowingly been practising quackery and fraud."

Yours most truly
LEWIS J SILVERS, M.D

March 4, 1937

2701 Grand Concourse
New York City

To the Editor

I read the letter signed by Doctor Joseph Popper on page 507 of the March first issue of your JOURNAL.

I am not a nose and throat specialist, nor am I especially interested in the controversy concerning Tonsillectomy vs Electric Coagulation. However, as a physician interested in the scientific progress of all medical endeavors, I wish to take strong issue with Doctor Popper's conclusion "those knowingly practicing this method (Electric Coagulation) may justly be suspected of quackery and fraud."

All physicians have seen innumerable cases of secondary tonsils following surgical removal. Are we to conclude that these surgeons are guilty of quackery and fraud?

Hernias recur in the hands of capable surgeons. Biliary calculi often recurs after the removal of the gall bladder—are these surgeons to be suspected of quackery and fraud?

Many physicians see patients whom they feel require the removal of tonsils, but in whom there is a definite contra-indication

for surgical procedure. In these selected cases electric coagulation of the tonsil is unquestionably a therapeutic and ethical procedure.

Is it possible that Doctor Popper will next include those of us who refer selected cases for electric coagulation as a party to fraud and quackery?

Very truly yours,
NORMAN STRAUSS M.D., F.A.C.P.

Pneumatology

40 E 61 St.,
New York City

To the Editor

No advocate of the term, "Pneumatology" however ardent he might be could fail to be amused by the quaint interpretation which appeared in the editorial "Pneumatology," page 311 in the NEW YORK STATE JOURNAL OF MEDICINE, for February 1, 1937

We are willing to admit that in the shadowy land of asphyxiation it is sometimes difficult to determine just where the mortal frame yields domination over the spirit of Mr Jones. In this sense, we do deal with the spiritual

In the name of consistency, however, if our interpretation is to convey Alice In Wonderland impressions, we would suggest that the Surgeon remain a barber, and that the Physician limit himself to the use of physic

Somehow, the lay interpretation, (New Standard Dictionary of the English Language, Funk and Wagnalls, New York and London, 1927) of Medical terminology is not entirely satisfying. Curiosity has urged us, therefore, to consult authors of Medical Dictionaries, including, Stedman, Lippincott, and Dorland. These references are as follows

Pneumatology The science dealing with air or gases, their physical and chemical properties and among other things their therapeutic application. Stedman, 12th Edition, 1934, page 853

Pneumatology The science of gases and their therapeutic application. Lippincott's new Medical Dictionary, Third Edition, page 751

Pneumatology The sum of what is known regarding gases and air and

their therapeutic application. American illustrated Medical Dictionary, Dorland, 1925, page 898

It would seem, therefore that the substitution of Pneumatology for Gas Therapy is not entirely original with the undersigned. An unbiased mind will very likely find this a satisfactory solution of a present problem

In passing, it may be well to note that Pneumatology, as a terminology, was not proposed by the Society for the Prevention of Asphyxial Death, Inc. The blame for this suggestion is accepted in its entirety by

PALUEL J FLAGG, M.D.

What to Expect after Plastic Surgery

12 E Bridge St
Oswego

To the Editor

It has become increasingly apparent to me in the last few years, that we sentence women to the operating table for pelvic surgery without a thought of what the aftermath may be

As I write, it occurs to me that perhaps a physician would be quite at a loss to say what his reaction would be, were he to be castrated. Would he be apt to be facing a postoperative mental chaos? I would guess that we probably all would, in that event. Disclaim the role of sexual urges as we will, it is still rather a potent leaven in human affairs. And when the reproductive organs are removed, there is inevitably some mental readjustment required

I call to mind a very attractive matron of some forty-one or less years, sent to me by her surgeon because of a highly disturbing tic, a gross turning of the head over the shoulder, so that the whole effect was that of a spasmodic, recurrent wry neck

She had had, some few months previously, a complete hysterectomy. The tic developed at once after the patient became ambulant. Careful neurological and ophthalmological examinations failed to reveal any pertinent causes, and much less suggest any cure. Out of the numerous interviews there was evolved the following interesting facts, the patient's husband had always been inclined to be a philanderer,

and consequently she had never felt quite secure in her claim on him. As there were no children, he represented her whole field of emotional dependence. Her description of their sexual life together would not lead you to feel that it had been a startling success. The patient possessed the firm belief that once the uterus was removed, then intercourse could no longer be effected, or in other words, she reasoned that her only means of holding her husband at all, had been removed. The tic, as subsequent successful treatment proved, was the attempt of an immature personality to establish a new hold on the husband's sympathies through a disconcerting illness. Once this had been formulated and accepted by the patient, the tic disappeared, and has been absent for over two years.

Another well-organized, stable English woman, suffered from a highly disturbing sense of guilt after hysterectomy, because she felt that she could no longer play her part in the marital relationship. She felt that the operation had completely unsexed her, and that notion, plus the fact that intercourse was slightly painful, (due in part to a fore shortened vagina) grew to the erroneous conclusion that she no longer loved her husband. This tormented her until she became highly disturbed and depressed. With careful explanation and encouragement, gradually she grew to understand that her loss of libido was really a physiological phenomenon due to age, and

not a result of operation, or loss of regard for the partner.

As an intern I clearly can picture a fat, dull-witted female awaiting hysterectomy in a charity ward. The night before the operation I stopped at her bedside while making night rounds and she said, "Doc, are you goin' to take out all my insides?" I enthusiastically reassured her that we were, and then she said, "Leave a few sparks in, will you?" As I consider this patient now, I can understand that even the dull-minded individual has some qualms over being surgically unsexed.

To be sure it must be confessed, that one is far from knowing actually what happens after removal of the sexual organs. There undoubtedly is a biological aspect, and without question an endocrine crisis is precipitated, but also we have good reason to believe that there is a psychic dilemma initiated.

It appears that preparation for a pelvic operation should entail a careful explanation of what the patient can reasonably expect afterwards and, that the operation does not necessarily spell sexual extinction. To my mind, thus properly executed, will forestall many pitiful nervous reactions after surgery of the female generative organs.

Very truly yours,

C. K. ELDER, M.D.

February 8, 1937

MORE MEDICAL AID FOR SPAIN

A Women's Committee for Medical Aid to Spain, including in its list a number of distinguished members of various professions, has undertaken to send at least six doctors with an American ambulance unit to Spain, where an American Base Hospital is being established under the leadership of Dr. Edward Barsky, New York surgeon of the Medical Bureau of the American Friends of Spanish Democracy.

The ambulance unit being organized under the supervision of leading medical authorities of Harvard, Yale and Johns Hopkins universities, has the active support of such women as Dorothy Parker, Babette Deutsch, Margaret Bourke-White, Beatrice Kaufman, Genevieve Taggard, Margaret Fisher, Elinor Curtis, Agnes E. Benedict, Carol Weiss King, and others.

FOR WHOSE BENEFIT?

Every proposal for change in medicine should be tested with the question "For whose benefit?" Unless the change will help, either directly or indirectly, in the fight against disease and death, it cannot be justified. The fact that it may increase the income of physicians, help pay the interest on hospital investment, or provide

salaries for a body of administrators, unless it will also improve medical service, is no justification. This is a simple test, but applied strictly to many of the proposals for medical changes before the public at the condemnation.

—*Jour. A. M. A.*

SYRACUSE ACADEMY OF MEDICINE

VARIOUS IDEAS ON MANY SUBJECTS

EDWIN H SHEPARD, M D, *Syracuse*

From great antiquity the tale has come own to us that swans sing most sweetly just before their end. Whether or not swans sing at all, sweetly or otherwise, I do not know, but the idea fits in most appropriately with the retirement of a president of The Academy of Medicine. Designated never again to be president or to give a retiring president's address, he must sing most sweetly, for he will never have another chance. This, then, is my swan song.

An address such as this I presume needs a title. My wife gives me permission to tell a story about her, which I think is appropriate and to the point. On a trip abroad she had an indexed note book in which she kept a record of the important features and events. Under the letter "V" was the all-inclusive heading "Various ideas on all subjects." This suggested a title.

The purpose of the president's address, I presume, is to give counsel to the members of the organization, this indeed in spite of the sage advice of the Roman philosopher who remarks that "many receive advice and few profit by it." It has been my effort not to give too much advice. The great naturalist, John Burroughs, was given a party on his eightieth birthday, and one of his noted guests asked him the secret of his long and happy life. He said, "I've always had a motto, 'Be cheerful and mind your own business.'" Since then, with limited success, I have tried to make this my motto too, and I have found it a good idea. It need not be taken in too narrow a sense, however, for we all are entitled to a lively interest in the things that take place about us, but a proper sense of proportion will show us where our responsibility may cease.

I like to read from my favorite author, Montaigne, the one whom Sir William Osler describes as the "sanest of men." Montaigne lived and wrote nearly 400 years ago, yet you or I can sit down with him and be

as refreshed as by a visit with a wise old friend. Now hear what Montaigne has to say about advice. "When any of my friends address themselves to me for advice I give it candidly and clearly, without sticking, as almost all other men do, at the hazard of the thing's falling contrary to my opinion and that I may be reproached for my counsel. I am very indifferent to that, for the fault will be their's for having consulted me, and I could not refuse them that office."

The older I grow in practice, the more deeply do I venerate the great institution of Medicine. The more humble should we all be, too, when we consider how great it is and how small a part each one of us plays in it. As physicians, I believe we may count ourselves among the most privileged, to be allowed to engage in a work so practical, so ennobling, and so venerated. We are even given a standing in the community which our own merits scarcely warrant. And so with these privileges comes an obligation.

Francis Bacon, about the year 1600 remarked, "I hold every man a debtor to his profession, from which, as men of course do seek to receive countenance and profit so ought they of duty to endeavor themselves by way of amends to be a help and ornament thereto."

More than any of us have done, we should strive to advance the standing of Medicine, both in practice and in public esteem. Our sole claim to whatever distinction we enjoy as members of the profession, rests upon the conviction, that doctors are concerned in giving unselfish care to the afflicted. Unselfishness in our professional and public conduct is the measure upon which our profession is judged by the laity. Therefore are we inspired to do a better part in making ourselves to the profession, as Bacon says, "a help and ornament thereto."

The retiring president is perhaps expected to suggest changes or improvements in the methods of conducting the affairs of the Academy. This I hesitate to do. An organization such as this functions best without too many rules or forms.

The real and main reason for our existence is that we may have a scientific body, first to furnish instruction to our members, and second to afford an opportunity for study and improvement for those who choose to prepare and present scientific material. The advantages here offered are of great importance. To those who have not taken advantage of all the privileges offered in the Academy I would urge that they watch, lest precious opportunities be allowed to slip past them.

The social side of our organization is one which is worthy of fuller development. I am sure that in the past we have neglected and missed many opportunities. Furthering of acquaintance and friendship can only result in harmony and good feeling. We should have stated occasions for social fellowship, as for instance an annual dinner which is held so successfully by many other Academies. I am told that the New York Academy at each meeting has a collation, served through the generosity of a bequest from one of its members. This is a good suggestion for any of you who would like your memory kept green in the Syracuse Academy. There has been some discussion about establishing postgraduate instruction for our members. The idea is most attractive, but there is much chance that the plan might be more ambitious than the accomplishment. The New York Academy of Medicine has a plan which seems to work well in this regard. They have what is called the "Graduate Fortnight," when for two weeks each fall instruction is given by men who spend much time and effort, deep thought, and unusual executive ability to instill the spirit of educational adventure in the members. If any plan for postgraduate instruction is considered here I would suggest that the Graduate Fortnight be looked into.

This paper is of too limited a scope to venture hardly at all into the field of medical education, yet it is a topic in which we are all greatly interested. Is the present system of medical education so planned as to utilize to the best the student's intellect

and time? There are those of us who believe it is not. We are pleased to think, however, that one of our own members, Dean Weiskotten, has been engaged during the past two years with investigation of medical colleges and medical education and we are hoping the Academy may one of these days hear from him regarding these topics.

We were interested to hear in a medical meeting recently a description of the pioneer work which our local medical college has been the first to introduce, in the matter of training students to follow up their hospital cases in the homes where, by personal contact with the patient, they learn of social conditions and individual problems. This is the first attempt known to us where a definite effort has been made to teach the art of medicine. The work meets with our approbation, for its methods and motives are worthy of success. We shall hope that it may be fully developed.

Personal contact with the patient and his family is the one method that can teach the art of medicine, and it seems sometimes that the art of medicine stands equal in importance, especially in the mind of the patient, with the science of medicine. We can look back on the good old family doctor of a generation ago with a feeling of love and sometimes almost reverence, not particularly for his knowledge, but for his real human qualities.

Dr J Tate Mason, recently deceased president of The American Medical Association, in his inaugural address said

I fear that some of us became old in the practice of medicine before we realized that the man of yesterday, with a limited amount of scientific knowledge, who had in a kindly, knowing, sympathetic way placed his hand on the little girl's brow and said, "We will not let you suffer, you will be well in a few days," did more for her endocrine glands, that store house of chemical activities in her body, to ward off and cure disease, than anything which has been discovered in recent years. So we must realize in the practice of medicine that fear, ambition, love, hatred, pleasing impressions cause a great and lasting influence on the greatest of all chemical laboratories that we carry in our bodies from birth until death.

Some years ago it was proposed in the local medical school that anatomy and physiology be taught in correlation and at the same time with clinical subjects. In France

he candidate for medicine begins to walk the wards as soon as he is enrolled. It was proposed here that the student enter almost immediately into clinical work, and that the anatomy, physiology, and pathology of each structure and organ be studied at the same time when it was the subject for clinical instruction. This was a revolutionary idea, and it is not surprising that it was not at once adopted. But when the college with far-off vision appears, it would seem that in this plan a movement may start in medical education second only to Osler's accomplishments in clinical education of students.

In the present-day practice of medicine there is no factor which has aroused my apprehension more than what may be called the "mechanization of medicine," the substitution of machine or laboratory methods at the expense of the full use of the senses and intellect.

Were you to study the works of Harvey or Sydenham, or any of the great early masters of English medicine, you would be astonished at the intellectual capacity these men showed. In fact, you would be inclined to remark that we seem to have no such great minds in our own day. Your remark would contain a certain element of truth. These men did have great minds, but their intellects were greater because they were obliged to develop their powers solely by their own senses, working alone, not aided by mechanical means. Their superior intelligence was developed by independence.

Sir James MacKenzie in his book "The Future of Medicine," has much to say on intensive cultivation of the senses and intellect, without too great reliance upon mechanized methods. He says in one place:

We should study the human individual for the signs of disease, and the problems having been perceived, then seek their solution by experimental and laboratory methods. The physician studies the individual as a whole, recognizing not only the more dominant signs of illness, but seeking for the more subtle signs which can be revealed by the trained senses of a skilled examiner, or by his intelligent questioning of the patient, based upon an understanding of the significance of the patient's sensations. The idea which is dominant today, and which has to a great extent superseded this other, depends upon a revelation of the signs of disease devised in a laboratory.

In his address before our State Society last Spring, Lord Horder spoke upon this subject. He said in part:

Today we are witnessing the apotheosis of the machine in human life and it is not surprising to find that medicine, like other spheres of action, is being mechanized. The public has come to believe that machinery is revolutionizing the healing art and is dispensing with the need for human judgment. It is true that the introduction of instruments of precision into medicine has been of great service, but the interpretation of the results obtained by them in the individual case still demands wisdom and experience on the part of the doctor. Where the machine is greater than the man the patient perishes. A large section of the public does not understand this. It has such an incorrigible love for apparatus, and what it produces, that it hailed with acclamation a box of gadgets, constructed in defiance of all scientific principles, which claimed to hand out an exact diagnosis and even the appropriate treatment, and thus made the application of so fallible a thing as the human mind unnecessary. Failing the reduction of medicine to machinery, the public seeks salvation in the specialist and expert, and the more the apparatus and the more complicated, the greater its confidence.

It was MacKenzie who called attention to the limitations in interpretation of mechanical results. He said:

An abnormal sign revealed by an instrument has often been looked upon as a sign obscurely indicating danger and calling for treatment. The classification I have given shows that all signs revealed by instrumental methods belong to the structural group, and they give no warrant for a prognosis or line of treatment, but require that other signs must be looked for which indicate the functional efficiency or inefficiency of the organ.

And this he illustrated by the heart when he said:

By the simple interrogation of patients, with a due appreciation and understanding of their sensations, a knowledge of the heart's efficiency in the vast majority of patients can be got in a few minutes, more reliable and instructive than an examination made by a series of specialists employing the most elaborate mechanical means.

But the fetish of the machine is upon us. The laity are today more impressed by the results of a laboratory test, an X-ray, or an electrocardiograph test than by the skill and honesty of the best clinician.

Yes, I may say that many of the profession themselves are more impressed with mechanical results than with results from sound reasoning. Let us hope that the doctor knows enough to know that it is not all necessary. It has been said that the public demand from the mysteries of medicine what they require in the mysteries of religion, and where there is a demand there will always be those to meet it. "Hence," says MacKenzie, "we need not be surprised if the public look with trust on the magnificent temples dedicated to research and ignore the simple method of the practitioner with whom lies the future of medicine."

However much one may respect the indispensable value of the work of the laboratory or the findings of the x-ray or intricate mechanical devices, the point is that these findings should be the aids, not the fundamentals of diagnosis.

It is said by Dean Lewis, of William Sidney Thayer, that Thayer was endowed with keen senses which he daily exercised. They became more and more acute. His clinical sense was not inborn. It was developed by long years of history-taking and clinical examinations made with meticulous care. He possessed an accumulation of correlated experiences on which he could always call. Mechanical methods were ancillary. He would arrive as nearly as possible at a conclusion by the fundamentals of clinical medicine, and ask only for those tests which he thought would contribute to accurate diagnosis. He used the laboratory with discretion.

Ethics and Conduct

There is no subject which should interest us as physicians more than that of medical ethics, yet it is inadequately and infrequently discussed by us. We accept the truth of the principles of medical ethics without taking into recognition their depth and importance. Ethics is sometimes described as the science which tells us what the other fellow ought to do. A thought of its bearing upon our own selves is however not amiss.

I wonder if you have read carefully the Code of Medical Ethics which appeared last May in the *Bulletin* of the American

Medical Association. I venture to say that few of you did so, but if you did not it is your loss. One was inspired with a deeper realization of the responsibilities and duties with regard to the patient, and to one's fellow practitioner. A practice of the principles would do much for each of us toward eliminating the unnecessary friction and unhappiness which occur at many places in our work. We find that as a matter of fact, ethics in medicine, as in life, consists primarily in the practice of kindness and common sense, doing those things in every circumstance which we would expect of someone else in our place. Ethics is simply the practice of the Golden Rule.

The most treasured book in my library is entitled "The Duties and Qualifications of a Physician," written in 1772 by John Gregory, professor of medicine in Edinburgh. One hundred and sixty-five years ago these lectures were given before students of the University of Edinburgh. We should give more time in our curriculum of today, to such a subject. As we read the words of John Gregory we are deeply impressed by the high standards of conduct which they describe. His example would be sufficient if followed by us today. All the virtues of our own day are not of our making; most of them have descended to us from generations of men gone by.

As this book is not available elsewhere and you will therefore have no other chance to hear his words, I quote freely, being obliged, however, to limit myself to only a little of what he says. He writes:

Perhaps no profession requires so comprehensive a mind as medicine. In the other learned professions there is a certain established standard, certain fixed laws and statutes, to which every question must constantly refer and by which it must be determined. The case is very different in medicine. There we have no established authority to which we can refer in doubtful cases. Every physician must rest on his judgment, which appeals for its rectitude to nature and experience alone. To conquer his difficulties a physician requires, besides the qualifications of a proper education, the concurrence of a penetrating genius, and a clear, solid judgment, and in many cases a quickness of apprehension, instantaneously to perceive where the greatest probability of success lies, and to act accordingly.

Yet talents of another kind are also requisite. A physician has not only for an object the improvement of his own mind, but he must study the temper, and struggle with the prejudices of his patient, of the relations, and of the world in general, nay, he must guard himself against the ill offices of those who have sinister views in depreciating him. Hence appears the necessity of a physician's having a large share of good sense and knowledge of the world, as well as medical genius and learning.

Such are the genius and talents required in a physician, but a certain command of the temper and passions must be added in order to give them their full advantage. Sudden emergencies occur in practice, and diseases often take unexpected turns, which are apt to fluster the spirits of a man of lively parts and a warm temper.

Accidents of this kind may affect his judgment in such a manner as to unfit him for discerning what is proper to be done, or if he does perceive, it may nevertheless render him irresolute. Yet such occasions call for the quickest discernment, and the steadiest, most resolute conduct, and the more so as the sick so readily take alarm when they discover any diffidence in their physician. The weaknesses, too, and bad behaviour of patients, and a number of little difficulties and contradictions which every physician must encounter in his practice are apt to ruffle his temper and consequently to cloud his judgment, and to make him forget propriety and decency of behaviour. Hence appears the advantage of a physician's possessing presence of mind, composure, steadiness and an appearance of resolution, even in cases where, in his own judgment, he is fully sensible of the difficulty.

I come now to mention the moral qualities particularly required in the character of a physician. The chief of these is humanity, that sensibility of heart which makes us feel the distresses of our fellow creatures, and which of consequence incites us in the most powerful manner to relieve them. Sympathy produces an anxious attention to a thousand little circumstances that may tend to relieve the patient, an attention which money can never purchase hence the inexpressible comfort of having a friend for a physician. Sympathy naturally engages the affection and confidence of a patient, which in many cases is of the utmost consequence to his recovery. If a physician possesses gentleness of manners and a compassionate heart the patient feels his approach like a guardian angel ministering to his relief, while every visit of a physician who is unfeeling and rough in his manners makes his heart sink within him, as in the presence of one who comes to pronounce his doom.

The insinuation that a compassionate and feeling heart is commonly accompanied with a weak understanding and a feeble mind is malignant and false. Experience demonstrates that a gentle and humane temper, so far from being inconsistent with vigor of mind, is its usual attendant, and that rough and blustering manners generally accompany a weak understanding and a mean soul, and are indeed frequently affected by men void of magnanimity and personal courage to conceal their natural defects.

We sometimes see a remarkable difference between the behaviour of a physician at his first setting out, and afterwards when he is fully established in reputation and practice. In the beginning he is affable, polite, humane, and assiduously attentive to his patients, but afterwards, when he has reaped the fruits of such a behaviour and finds himself independent he assumes a very different tone, he becomes haughty, rapacious, careless, and often somewhat brutal in his manners. Conscious of the ascendancy he has acquired, he acts the despotic part, and takes a most ungenerous advantage of the confidence which people have in his abilities.

A physician by the nature of his profession has many opportunities of knowing the private characters and concerns of the families in which he is employed. Besides what he may learn from his own observation he is often admitted to the confidence of those who perhaps think they owe their life to his care. He sees people in the most disadvantageous circumstances, very different from those in which the world views them—oppressed with pain, sickness and low spirits. In these humiliating situations, instead of wonted cheerfulness, evenness of temper and vigor of mind he meets with peevishness, impatience and timidity. Hence it appears how much the characters of individuals and the credit of families may sometimes depend on the discretion, secrecy and honor of a physician.

Temperance and sobriety are virtues particularly required in a physician. In the course of an extensive practice difficult cases frequently occur which demand the most vigorous exertion of memory and judgment. I have heard it said of some eminent physicians that they prescribed as justly when intoxicated as when sober. If there was any truth in this assertion, it contained a severe reflection against their abilities in their profession. Intoxication implies a defect in memory and judgment, it implies confusion of ideas, perplexity and unsteadiness, and must therefore unfit a man for every business that requires the lively and vigorous use of his understanding.

I may reckon among the moral duties incumbent on a physician that candor which makes him open to conviction and ready to

acknowledge and rectify his mistakes. An obstinate adherence to an unsuccessful method of treating a disease must be owing to a high degree of self-conceit and a belief in the infallibility of a system. This error is more difficult to cure as it generally proceeds from a defect in the heart. Such physicians see that they are wrong, but are too proud to acknowledge their error, especially if it is pointed out to them by one of the profession. To this species of pride, a pride incompatible with true dignity and elevation of mind, have the lives of thousands been sacrificed.

John Gregory goes on further to describe the conduct of physicians with relation to their patients, the other members of the profession, and the public, but there is no time to quote more from words far more worthy than my own. I would only add my appeal that such a subject as Medical Ethics is far too important to be neglected in the medical curriculum, and should be a part of every young physician's training before starting practice.

Education After Graduation

We are apt to think of medical education as ending with graduation and entrance into practice, yet we know how far this is from the fact. It is indeed a poor physician who is not educated each day so long as he remains at work. And upon the degree and intensity of this day-by-day education depends to a large extent his value to the profession.

We are disposed to envy the recent graduate in medicine, whose mind is filled with all there is in medicine. As we meet him in the hospital and clinic we find a veritable encyclopedia of facts. Yet, when he enters practice, and the years go by, we find this fund of facts slipping away and he is no longer the font of universal knowledge. He will forget much of the mere facts that he has learned, but he has made the foundation upon which even larger things may be built.

"No great thing is created suddenly, any more than a bunch of grapes or a fig," says Epictetus. "If you tell me that you desire a fig, I answer you that there must be time. Let it first blossom, then bear fruit, then ripen." It is in the fruition and ripening time that the real doctor is made. The years, when properly spent, continue to

build knowledge on knowledge, and make the man a scholar.

Cultural Education

A physician cannot stand on a high professional plane unless he is to some degree a scholar. And, contrary to generally accepted belief, scholarship is rarely born in a man—it is the result of years of faithful, constructive effort. Even so great a scholar as William Osler was not outstanding in his early school years. His school marks were mediocre. Like many another great man, his pre-eminence was due to constant study and effort, which made ordinary talents grow into the greatest.

As physicians who are true to the spirit of our work we should learn to love and to use books, for, until we learn to move easily among books, we shall never learn to move easily among ideas. And books, for a physician, mean not only medical books, but include all branches of literature with which a man of culture should be acquainted. Without a knowledge of the great literature of the world our horizon is limited. Instead of standing on the mountain peak and surveying the wide world, our vision without literature is narrowed to scenes of the hospital and the sick-room. With literature we are like the dwarf of whom Coleridge speaks. "A dwarf sees farther than a giant when he has the giant's shoulders to mount on." Ramsey MacDonald says, "The educated man is a man with certain subtle spiritual qualities which make him calm in adversity, happy when alone, just in his dealing, rational and sane in the fullest meaning of that word in all the affairs of life."

I would like to relate my own experiences in being introduced to the world's great literature, as illustrating a happy, and almost by chance, surmounting of difficulties. In youth I attended a poor preparatory school, as most of the village high schools were at that time. Not one teacher was ever inspired with the spirit of his or her work. Not one ever imparted a hint as to the purpose and value of study. Geometry, for instance, could have been taught as a fascinating subject, not as a "dry bones" matter of

memory, for it could have been shown that it is a science which teaches us to reason how certain facts are taken and from these deductions made which arrive at an important conclusion, thus affording a training for the use of reason and deduction in everyday life. Latin and Greek were taught as mere memory tests and translations of words. No teacher ever spoke of the wondrous beauties of the Aeneid and the Odyssey, which make them shining lights in the history of literature and mankind, examples of literature for all time. English literature was read as a task to gain credits. Who ever thought he was reading Shakespeare and Scott and Johnson for pleasure? They were beyond our immature minds anyway, and there were few or none of the pupils who did not look upon such reading with aversion.

My work in college was, I may say, unfortunate in being entirely along the lines of science and its allied branches, so no love of reading came with these years.

It was through Sir William Osler, that my first introduction to real reading came. Early in my professional career I bought Osler's "Aequinimitas," a book of his selected essays. On the very last page was a little essay entitled, "Bed-side Library for Medical Students," and to this one little page I owe a mighty debt of gratitude.

Osler wrote, "A liberal education may be had at a very slight cost of time and money. Well-filled though the day may be with appointed tasks, to make the best possible use of one of your ten talents, rest not satisfied with this professional training, but try to get the education, if not of a scholar, at least of a gentleman." He recommended reading a half hour in bed as a surprising way to accomplish much in the course of a year. He suggested a list of ten books with which to start a habit of reading. I bought them all and found a most excellent introduction to literature. They are

1 Old and New Testament

2 Shakespeare

3 Montaigne—and as Stuart Sherman says, "The first week with Montaigne is only comparable with one of the few great weeks of life."

4 Plutarch's Lives

5 Marcus Aurelius

6 Lpictetus

7 Religio Medici of Sir Thomas Browne

8 Don Quixote

9 Emerson

10 The Breakfast Table Series of Oliver Wendell Holmes

But time passes and I must not linger too long over this subject, engrossing as it is. I would only speak a word of counsel, particularly to the younger members. Before it is too late, begin to learn great literature and make the whole of the world your own.

And now a final and earnest thought. One of the most treasured possessions of a body of physicians is the harmony and freedom from partisanship which exist among its members. Such an enviable position came to us as an heritage from some of the great men who were among us and are now gone. No finer legacy could they have conferred upon us. Let us cherish this ideal—that no clique nor faction shall ever dominate our medical societies. Let them be kept free from manipulation and controversy.

If ever a man should arise, not yet seen upon the horizon, who would seek to disrupt the harmony of our organizations may the whole membership arise to overcome him. If there is one word I might say, which, I might hope may be remembered it be this one—Harmony.

I came to the end of this year's work with the particularly happy feeling that, during the year not one enmity had arisen and that I had a feeling of friendship for each member of this Academy. Imagine my feelings, then, when I found the following poem.

"You have no enemies, you say?

Alas! my friend the boast is poor—

He who has mingled in the fray

Of duty that the brave endure

Must have made foes! If you have none

Small is the work that you have done,

You've hit no traitor on the hip,

You've dashed no cup from perjured lip,

You've never turned the wrong to right—

You've been a coward in the fight!"

"Alas! Poor Yorick."

NEW YORK ACADEMY OF MEDICINE

IDEALS IN MEDICINE

JAMES ALEXANDER MILLER, M.D., *New York City*

Somewhat more than twenty-five years ago a frail figure possessed of a dynamic personality held a crowded medical audience spellbound by the power of his message. To those of us of the then younger generation who were present upon the occasion when Doctor Edward Livingston Trudeau delivered his presidential address to the Congress of Physicians in Washington, upon the subject "The Value of Optimism in Medicine," an inspirational uplift was given which the passage of time cannot dim and will never efface. In the search for an appropriate topic upon which to address the Academy of Medicine upon this occasion, the memory of that similar, though more notable occasion has kept recurring to my mind. In my thinking there was a wistful desire that, privileged as I had been to be intimately associated with Doctor Trudeau over a long period of years, I might possibly be enabled to pass on to another medical generation something of the idealism of the man, of whom perhaps we most often think as a pioneer scientist and physician but whose outstanding gifts were those of the spirit and of personality through which he so powerfully impressed that audience of years ago.

I approach the task which I have set myself with the greatest diffidence, fully aware of my own inadequacy. I am, however, encouraged to persist because of a deep-seated conviction that in this present troubled world we need to hold fast to our ideals as perhaps never before, and also because I cherish the hope that in spite of the imperfections in the presentation, nevertheless something of the spirit of that great man whom I have recalled to your remembrance may come through to you.

The Scientific Ideal

In the consideration of ideals in medi-

Reproduced by permission from the *Bulletin* of the New York Academy of Medicine, March 1937

cine with little doubt the first impulse of the modern medical mind would be to visualize the possibilities of medicine as an exact science. The progress which has been made in this direction is already so notable that the look ahead opens up vistas so promising that they are truly exciting. When we stop to realize that practically all that we today count as scientific medicine has developed within the span of the generation still alive, the possibilities of its future development cannot fail to grip the imagination.

Our entire knowledge of the bacterial origin of many infectious diseases has come since 1870, and the practical application of this knowledge came only after the turn of the present century. These few short years have sufficed to give us virtual control of diphtheria, of typhoid fever, of yellow fever, of malaria, of hookworm disease, of the acute intestinal diseases of children, and the dysentery of adults, to mention only some of the outstanding examples. Through the removal of the dangers of infection this same knowledge has made possible the extraordinary development of modern surgery. More recently has come also the better understanding of vitamin deficiency diseases, of blood disorders, and of the disturbances of the organs of internal secretion. Technical scientific advances have also made possible many instruments of precision useful in the diagnosis and treatment of disease, such as the Roentgen ray, the electrocardiogram, and numerous applications of chemistry to clinical medicine, both in diagnosis and in treatment. The whole field of the pathology of function, supplementing our previous too exclusive devotion to the study of the pathology of structure, has been opened up to the great advantage of many branches of medicine and of surgery. We stand at the brink of more exact knowledge of metabolic disease, of respiratory infections, of numerous virus

Address of the Incoming President Delivered at the Annual Meeting of the New York Academy of Medicine, January 7, 1937

diseases and even have hopes that before long, dreaded cancer itself may yield up its secrets to the methods of modern research

Notable names flash across our memory associated with these extraordinary achievements: Pasteur, Koch, Behring, Roentgen, Welch, Walter Reed, Trudeau, Banting, Minot, to mention only a very few. It is no wonder that the imagination of young students and practitioners of medicine is fired by a zeal to emulate their great achievements, to share in extending still further the boundaries of our knowledge and to help to conquer some of the innumerable problems which still lie before us. Such an ideal is indeed a noble one, a challenge to the very best, but to the medical profession of today as a whole it is not enough, far from it.

The Clinical Ideal

This we may characterize as the Art, as distinct from the Science, of medicine. Already we hear murmurings that we are in danger of losing this Art, that the startling progress of scientific medicine has in itself contributed to this direction. That we are thinking too much of our patient as an organism rather than as an individual, as a personality. That this has led to too great reliance upon the laboratory and upon scientific instruments of precision, and away from the personal equation of the individual as a whole, his psychic and emotional as well as his physical and physiological reactions to his environment as well as to his disease. That specialized practice restricted to one organ or to one group of organs, and even surgery itself, tend in the same direction.

The often expressed regret of the passage of the general practitioner is not confined to the laity. It is quite as common within the medical profession. In fact, the tendency to get back to the better appreciation of individual and personal relationships in medicine is quietly gathering strength in a manner which may have a deep influence upon the future practice of medicine. In some countries, notably Italy, France, Germany, and England, this movement has been dignified with a name. It is being discussed under the designation of "Neo-Hippocratism." Appreciation of the significance of this term requires a short excursion into medical history.

Hippocrates, known as the father of medicine, lived in the fifth century B C., the age of Pericles and the acme of Greek culture. With little or no scientific knowledge he established a system for the diagnosis and treatment of disease, based upon careful and accurate clinical observation. He insisted upon the fundamental importance of the knowledge of the constitution and of the nature of each patient, as he expressed it: "The physician must know a man's nature and a man's behavior through life in relation to all his actions." Thus, he established the supreme importance of personality and of personal relations.

From the point of view of the physician, Castiglioni has recently summarized the Hippocratic doctrine in masterly fashion as follows:

The physician's task of speculation and of observation, an artist's task, is insisted upon in all the works of the Master. A very good physician is a very good philosopher, that is to say, a man who can perfectly judge and reach right conclusions. Diagnosis and prognosis may be taught by the Master, that is stated in the Hippocratic texts, but the patient's treatment, the behavior at the patient's bedside, the therapeutic intervention, cannot be taught. In determining them the artist's qualities are revealed. Hippocratic medicine is individualistic because it admits the importance of the physician's personality. Moreover, it establishes the basis of professional practice: the physician's faith in his art, together with the right appreciation of its limitations.

In 150 A D., six centuries after Hippocrates, came Galen, the next outstanding leader of medical thought. Although Greek in origin, his ideas developed in the environment of Rome. Galen's doctrine, though based upon that of Hippocrates, developed the analytical method, the study of specific diseases of specific organs, and the application of specific remedies. One finds little mention of constitution or of personality in the teachings of Galen, and dogmatism replaces philosophy. Galen completely dominated medical thinking, such as it was for more than sixteen hundred years. A gradual release from this subjugation appeared in the 17th century with the beginnings of independent medical observations and ideas, and was contemporaneous with similar movements in other fields, the Revival of Learning, the Reformation in Religion, and the Renaissance in Art.

By painfully slow steps progress was made during the intervening centuries until our own, with the influence of Galen unconsciously persisting, until, in the latter part of the 19th century, the rapid development of scientific knowledge in itself produced a definite reaction back toward the Galenic ideas of specific diseases for specific organs. This was definitely expressed by Virchow, in 1902, when he said, with the weight of his great scientific reputation behind him, "There are no more general diseases but only diseases of the organs and diseases of the cells."

Neo-Hippokratism is the counter-reaction against this tendency. It voices a call to go back and sit at the feet of the ancient master. To think of man as a whole, of his constitution and his nature. To consider disease as a dysharmony of normal relations, as disturbance of function as well as of change in structure, to consider the emotional and the psychic as well as the physical and to bring back personality as expressed both in patient and in physician, as a determining factor in successful treatment. This is a challenge to modern clinical medicine. Far from excluding the advances of science from its purpose, it eagerly grasps each new discovery as an increased opportunity for usefulness, but translates science into terms of a personal equation applicable to individuals by individuals. The great masters in clinical medicine knew and employed these methods, Sydenham, Heberden, Laennec, Watson, Abernethy, Osler, Trudeau, Grenfell, Delafield, and Janeway. The memory of great names in medicine such as these reminds those of us who were not born to be scientists, that we may still hold up our heads as worthy of the name of physician if we follow the same ideals as they. But let us do so in humility as well as in pride, keeping in mind that most famous of the aphorisms of Hippocrates.

"Life is short, the Art long, opportunity fleeting, experience treacherous, and judgment difficult."

The Ethical Ideal

The father of medicine did more than give us the first firm basis for clinical medicine, he gave us the first principles of ethics for our profession, crystallized in the

Hippocratic oath to which we have all subscribed. The term medical ethics does not represent simply a code of honor between physicians, a sort of gentlemen's agreement, and it certainly is not, as some have assumed, a defensive coloring designed mainly for our own self-protection. It means rather an oath of allegiance to ideals of professional contacts in our relations to each other, to our patients, and to the public. It is the concrete expression of the responsibilities of our calling, sacred in the sense that we may hold in our hands the power over life and death. It is the dedication of our knowledge, our powers and our gifts to the service of others rather than to the hope of reward for ourselves.

In these troubled days when the forces of materialism have grown great about us, the road is not easy. Temptations to self-interest, to carelessness, to sharp practices or even to those that are frankly unethical, often beset us. These can only be overcome by a devoted adherence to those ideals which, though Hippocratic in origin, are really spiritual in their essence. This requires persistent effort to develop, through all of our professional contacts, that sympathetic understanding of ourselves, our fellows and our patients which makes for integrity of character and for the true expression of that rare gift of God, personality. This is truly the power of the Spirit, against which mere material forces will break in vain.

Community Responsibility

As the pursuit of our scientific and clinical ideals has tended to make our profession individualistic in its approach to medical problems, it has also tended to make us more or less forgetful of other important responsibilities. During recent years the practical application of our growing medical knowledge has become increasingly evident to the world at large, and is now recognized as possessing great significance for the community as a whole. This has resulted in a demand for an extension of our activities far beyond the intimate personal relationships between individual physician and patient, to those broader fields which we designate as social and preventive medicine.

In social service we are gradually com-

ing to appreciate that a study of the living working and economic conditions with which our patients are surrounded, often illumines difficult clinical pictures and may point the way toward proper and adequate treatment. Also we are beginning to realize that by increasing our knowledge of community activities in social, economic and industrial fields, we immeasurably broaden our horizon of interest and of culture and thus become not only better physicians but better citizens. This leads us directly into the field of preventive medicine, for by the very fact that we are uncovering the causes of illness we become responsible for the attempt to prevent its occurrence in others. It, consequently, becomes an important part of our job not only to treat people when they are sick but also to help keep them well, and thus we reach out from the bedside, to the family, to the various social groups and to the community. This part of our task brings us closely in contact with public health agencies with which we must cooperate closely in their effort to improve the health of the community. What a wonderful power we, as a body, could exert in this field if each physician constituted himself a health officer for the families under his care, detecting and correcting physical defects, following up sources of infection in syphilis, in diphtheria and other communicable diseases, following up the contacts in cases of tuberculosis, and in general in every way cooperating closely with our public health authorities in the effort to prevent disease! The record of accomplishment in this field is imposing, but as long as thousands still die each year from diseases which we know to be preventable, we must continue to increase our efforts. Government, health authorities, and other organized health agencies can do much, but individual physicians, if their efforts are properly directed, can do even more. The prevention of disease, therefore, becomes a challenge of the future to our profession, an ideal to which we must aspire.

The Academy of Medicine

Now, the New York Academy of Medicine is organized to foster all of the professional ideals which we have been considering. Higher standards of scientific and

clinical medicine are promoted by our splendid Library which is available to all members of the profession and to the general public. Our section and general meetings afford a forum for the free discussion of all phases of medicine and our Committee on Medical Education is assiduously developing the wider use of the opportunities for graduate instruction, and specifically through the Graduate Fortnight each year a symposium on special topics is arranged which has proven a most useful and popular institution. Also, many of the important papers presented before the Academy are published in our monthly bulletin. So that, taken all together the Academy represents one of the most important institutions for postgraduate education in this city and indeed in the whole country.

The maintenance of high standards of ethics is the constant concern of the Council, of the Committee on Admission and of the Committee on Professional Standards. Also, through the Academy the relations of the medical profession with the general community have been developed to a remarkable degree during the past twenty-five years. The Committee on Public Health Relations has established intimate contact with all aspects of community life which touch upon health and general welfare, and it has become the close adviser of the city Departments of Health, of Hospitals, of Welfare of Education of Sanitation and of Civil Service.

Through our Medical Information Bureau we act as interpreters of current medical knowledge to many individual inquirers but especially to the press and to the public, and we have carried out many independent studies and surveys in the field of public health. The Academy publishes a monthly magazine devoted to preventive medicine for physicians, and through the course of Lectures to the laity we have done much to popularize sound medical knowledge. Through cooperation with the organized county and state societies the Academy has constantly attempted to guide the trends of medical practice within the range of economics, of social welfare and governmental relations, into sound channels which, while protecting the rights and standards of the medical profession, are primarily designed to promote the best interests of the community as a whole.

With this cursory review of the record of achievement behind us, we who are Fellows and Members of the Academy have a responsibility to maintain and to advance our medical ideals, which is even greater than that which devolves upon the profession as a whole. We of the medical profession have a noble heritage, and we of the Academy have an especially notable tradition. These constitute a challenge to the future that we should hold true to our ideals of service, with hopes of any reward as a secondary consideration. Those of us who, for a passing period, are charged with the responsibility of guiding the counsels of the Academy of Medicine pledge ourselves to give the best of our thought and energy to this end. We do so unhesitatingly because we are confident of your support.

Quite recently I had occasion to quote from the address of Doctor Trudeau to which I have already referred. I beg your

indulgence if I repeat these words here, for they express far better than any at my command the spirit of the ideas which I have attempted to convey.

At the conclusion of that address Doctor Trudeau left this message which I in turn would like to leave with you:

"Let us not", he said, "Let us not, therefore, quench the faith nor turn from the vision which, whether we own it or not, we carry, as Stevenson's lantern-bearers their lanterns, hidden from the outer world, and, thus inspired, many will reach the goal, and if for most of us our achievements inevitably must fall short of our ideals, if when age and infirmity overtake us 'we come not within sight of the castle of our dreams,' nevertheless all will be well with us, for, as Stevenson tells us rightly, 'to travel *hopefully* is better than to arrive, and the true success is in labor'."

ANOTHER FLY IN THE ALPHABET SOUP

As a result of the stringent relief definition of "needy" doctors, the venereal disease project, a favorite of Mayor LaGuardia and Governor Lehman, is finding itself slowed up in its work, it is claimed by Oscar R. Fuss, secretary of the City Projects Council.

As matters now stand, he said, the WPA project needs more doctors but is not permitted to hire them, impoverished doctors need the jobs but are barred from taking them.

The root of the trouble, he said, was the rule that doctors seeking relief jobs must meet the definition of neediness set up by the Emergency Relief Bureau and be so certified to the WPA.

And the ERB, he said, is not permitted to certify a doctor as needy if he owns doctor's equipment and has an office and the use of an automobile, no matter how near he may actually be to destitution.

Mr. Fuss's contention, expressed in letters to the Mayor and the Governor, received support today from Dr. William H. Best, deputy commissioner of the Department of Health, which is sponsoring the project.

Dr. Best said, "It is true we can use as many physicians as we can get. The program itself is enormous and the work done on it is limited only by the amount of appropriations. It could be enlarged many

times. Within the present appropriation we can use more physicians if they are made available."

The current WPA rule, Mr. Fuss said, excludes a number of physicians recently dismissed as a result of the dismantling of the Compensation Division. While they cannot meet the new need requirement, he said, their practice is often so small, partly because of their recent dependence on WPA compensation work, that they generally need WPA jobs at the fixed pay of \$23.86 a week.

Though the Governor and the Mayor have both given strong support to the anti-venereal disease campaign, ERB authorities insist that there is no legal possibility of making exceptions on this project.

"In the past," said Mr. Fuss, "the ERB did not have the same stringent rules. Physicians were allowed equipment, home and office rent and the use of an automobile. If their net income amounted to less than \$20 a week after debiting these expenses, they were eligible to need certifications."

"Here, then, is the situation."

"The WPA has the jobs. The physicians need the jobs. The jobs are socially desirable. Officials have publicly promised they would make every effort to create jobs of this type. But one-time WPA physicians cannot get the jobs."

COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

The Committee on Public Health and Medical Education has sent out the following letter, etc., to the secretaries of all the county medical societies

As you know, one of the principal activities of the State Medical Society during the past year has been its participation in the Pneumonia Control Program, carried on under the combined leadership of the New York State Department of Health and of this Committee. The Committee's work has been reported to the House of Delegates at its last meeting, and in addition, a detailed and informative report on this particular activity was published in the *NEW YORK STATE JOURNAL OF MEDICINE*, on July 15, 1936, in Volume XXXVI, No 14, page 1053

In a letter sent you over a year ago, the purposes of this campaign were stated as follows

- 1 Early medical care for pneumonia patients
- 2 Laboratory service for rapid type determination and other bacteriological studies
- 3 Increased use of concentrated anti-pneumococcic sera, when this treatment is indicated
- 4 Adequate nursing service for all patients

Following this letter, a large number of county medical societies promptly arranged for the consideration of pneumonia on the scientific programs of their meetings. The list of these societies is published in the report referred to above. In addition, the following county societies have had such meetings since this report was published: Franklin, Niagara, Wayne, Oswego, and Sullivan. The splendid cooperation which so many county medical societies have given to this program is evidence of their interest and willingness to make the Pneumonia Control Program a decided success.

As the physicians' participation in this work is an absolute essential, it is necessary that county medical societies continue to function in this matter. In counties where no pneumonia meeting has yet been held, arrangements for such a meeting should be made immediately. This is imperative, and if your county society meets only at rare intervals, a special meeting should be called

for this purpose. As you know, our Committee will be very glad to supply speakers for this meeting.

It is most important that each county medical society has a committee to direct this work. In the case of smaller societies, undoubtedly the public health committee will suffice for this purpose, but in larger counties, a sub-committee on pneumonia should be created. On these committees should be men especially interested in this subject, and willing to work. Since it is essential that this work be closely correlated with the activities of the State Department of Health, it is suggested that the District State Health Officer or County Health Commissioner, where the county is so organized, be asked to sit with them. A program for suggested activities for such committees is herewith attached.

A copy of this letter is going to the chairmen of public health committees of county medical societies. Inasmuch as we have not the names of all of these chairmen, and as undoubtedly changes have been made in the personnel of these chairmen in some societies, I am asking the secretaries of all county medical societies to make sure that the public health committees receive this information.

The various other organizations which are co-sponsors with the State Medical Society in the Pneumonia Control Program are highly pleased with the efforts, so far of the medical profession, and have shown a spirit of fine cooperation in this matter. It is essential that this record be maintained. Will you kindly see that I have some information as to what your county society is doing or is planning to do in this regard?

With kind wishes, I am

Very sincerely yours
THOMAS P. FARMER, *Chairman*

P S Additional copies of the suggested program for county medical societies may be obtained on request.

A Suggested Program for Public Health Committees and Subcommittees on Pneumonia of County Medical Societies

The following suggestions are those which the Committee on Public Health and Medical Education feel are matters which should receive early attention in formulating

a pneumonia control program within county medical societies. Space permits only of a mere listing of these activities. It is realized that no definite program can be

set up which would be applicable to all county medical societies, because of varying conditions within these counties. Undoubtedly some of the topics listed herewith may be unnecessary in your county, while other problems not listed may be of much concern. Our Committee, at all times, will be of service in the way of advice or suggestions.

1 Medical meetings. The following subjects might be considered for discussion where a preliminary meeting has already been held.

- a Serum treatment (especially of the "higher" Types)
- b Oxygen treatment
- c The bacteriology of pneumonia
- d Nursing care of pneumonia
- e The epidemiology of pneumonia.

In counties where no meeting has been held, it is felt that a general symposium on pneumonia would be most desirable. The Committee has obtained the services of a group of highly qualified speakers to present these subjects and would be glad to assist in any way possible in arranging the desired program.

2 The availability of "approved" laboratory service might well be considered. It is especially important to have the service arranged on such a basis that it is immediately available for everyone needing it. In considering the requirements of an approved laboratory and the question of establishing a county service with State-aid, if it seems desirable, the advice of the District State Health Officer should prove of great value.

3 The same sort of consideration might be given the available visiting and public health nursing service.

4 Hospital staffs should be encouraged to take up the subject of pneumonia at staff meetings for the purpose of giving particular emphasis to the necessity of typing and to the details in technic of serum administration. This is particularly important since a survey last year indicated that only about 50 per cent of pneumonia patients hospitalized had proper bacteriological studies made.

5 The subject of reports upon cases where serum has been used merits discussion. Many physicians are failing to supply these reports which are requested by the State Department of Health where serum furnished gratuitously by it, has been used.

It is in a large measure through the efforts of our Committee that the new concentrated serum is distributed by the State Department of Health. Physicians should show their appreciation of this service by prompt return of these reports. Moreover, such reporting is essential to the continuance of this serum distribution in the future and to the maintenance of high standards for it.

6 The discussion of interesting cases in which serum has been used would form excellent topics for programs of county medical societies.

7 Education of the public. It is earnestly hoped that the county medical societies will endeavor to arrange talks to lay groups. The Women's Auxiliary to the County Medical Society, where established, undoubtedly would be a source of great aid in this matter. Other lay organizations which have already indicated interest and willingness to cooperate are Federation of Home Bureaus, Federation of Women's Clubs, the State Tuberculosis and Public Health Association, and 4-H Clubs. It is suggested that any or all of these agencies be encouraged to institute an educational program on the subject of pneumonia for their members. Such education should be focused upon the necessity for prompt medical care of severe respiratory infections and the recognition of the emergency nature of pneumonia. The Bureau of Pneumonia Control of the State Department of Health has literature of value to such groups. Our Committee will help county medical societies in providing suggestions for talks before these groups.

8 Our Committee or the Bureau of Pneumonia Control of the State Department of Health whose Director works in the closest possible contact with us and has the full authorization of our Committee, will be glad to give you the benefit of our experience with this type of program in other counties, of a considerable amount of relevant literature, in the selection of speakers and arrangement of programs, in the display of exhibit material (eventually to include both popular and technical motion pictures on this subject), by providing outline material for lay talks and in any other way possible.

* * *

Your full cooperation with our Committee is requested to the extent that your program may conform in certain essentials to the recommendations of the State Society.

One of the country's ace radio vocalists is on the air for a famous cold cure. A

few nights ago he had to cancel his appearance. It seems he had a cold.

COMMITTEE ON LEGISLATION

Bulletin No 7

March 3, 1937

The following bills have been introduced during the past week

Senate Int 1001—Feinberg, Assembly Int 1450—Leahy, amends the Public Welfare Law by requiring the State to reimburse public welfare district to extent of one-half of amount expended for medical attention and hospital care Referred to the Relief and Welfare Committees

Senate Int 1024—Livingston, amends the Public Welfare Law by making town responsible for home relief and medical care of defective and physically handicapped and illegitimate children, and authorizing care of illegitimate child and mother at free boarding home or institution Referred to the Relief and Welfare Committee.

Senate Int 1041—Rogers, Assembly Int 1389—Roach, amends the Agriculture and Markets Law by providing that food products shall not be colored, powdered, coated or stained in manner to conceal inferiority, and requiring the name and address of manufacturer or distributor be printed on label Referred to the Agriculture Committees

Senate Int. 1089—Kleinfeld, Assembly Int 1487—Bush, amends the Mental Hygiene Law by requiring certification of qualified examiners and psychologists by commissioner after verification and submission of evidence before judge of court of record, and authorizing commissioner to revoke after hearing Referred to the Judiciary Committee in the Senate and the Health Committee in the Assembly

Comment This amendment is proposed by the Department of Mental Hygiene to give the Commissioner the power to rescind a certificate that may be given a psychologist who later is found not to possess the specified qualifications

Assembly Int 1386—Miss Byrne, amends the Public Health Law by requiring birth certificate to contain photograph of fingerprints of mother and footprints of child Referred to the Health Committee

Assembly Int. 1399—Fitzgerald, amends the Public Health Law by creating in the Health Department a consumers' division for registration, advertising control, analysis, scientific research, education and publicity of manufacture and sale of foods and proprietary products, and for regulating traffic therein, and appropriating \$250,000 Referred to the Ways and Means Committee

Comment This bill is almost identical with the Esquirol-Holley bill The particular differences are that it carries an appropriation and provides that the reports of the director shall be submitted to the Governor through the Commissioner of Health

If you would like a copy of any of these bills, we shall be glad to send them to you

* * *

The description of Assembly bill Int 1325, by Mr Milmoe, in Bulletin #6 was in error Before seeing the printed bill we understood the amendment was to provide that one physician might be both health officer and medical inspector, but the amendment really provides that a physician may be school trustee and medical inspector if no other physician is available in the district

Hearings on Bills

Yesterday the Senate Committee on Education held a hearing on the Physiotherapy Technician and Optician Bills One group of physiotherapy technicians opposed the bill, in spite of the fact that they had been consulted when the bill was drafted and had given their approval to it Nevertheless, yesterday, through their counsel, they raised objections, not to the discontinuance of the provision for future licensure into their group, but to the provision which provides the same penalties for them as are now operative over practicing physicians Their counsel said there are a few more than three hundred physiotherapy technicians operating in the State, and he had present at the time ten per cent of that number to support his protest Representatives of the Department of Education and the Medical Society appeared in support of the bill and pointed out to the committee that its enactment would be in the interest of the public good as well as in the interest of the physiotherapy technicians

The Optician Bill was opposed by the optometrists and representatives of the Retail Merchants' Association

Action on Bills

S. Int. 210—Hanley—Livingston Co bars T. B. patients—3rd rdg. in As.

There follows a resolution introduced by Assemblyman Zimmerman who comes from the 14th District of Kings County, asking for an investigation of the hospitals of New York City. Mr. Zimmerman says that hospital facilities in his District are very unsatisfactory and he had many complaints during the campaign period of laxity and irregularity. He says he does not mean this resolution to be taken in an antagonistic spirit, but in a constructive spirit. He confesses that he is a layman and his approach to the question is purely that of attempting to represent the people of his District. The resolution is so searching and so far-reaching that we think the complete text should be in the hands of every one of our bulletin readers.

Whereas, the City of New York maintains a vast, extensive organization in the ownership, operation and maintenance of a large chain of hospitals and institutions for the sick, and maintained as they are at an almost stupendous, staggering expense to tax payers, and

Whereas, These hospitals have for their purpose and function to alleviate all possible human suffering—safeguard the health and lives of millions of men, women and children, and make available the needed ways and means for a mass population of some seven (7) millions of people, residents of the City of New York to improve, protect or rebuild their physical and mental bodies—their social status, enhance and make more secure to themselves added years of earning capacity and expectancy of life, and

Whereas, This hospital organization which stands out to the taxpayers as the most momentous piece of publicly operated machinery second to no other branch of the City Government in importance and worth to the people—a business which has so greatly expanded in size and significance as to compare with any of our giant American industries or enterprises, and

Whereas, Recent observations indicate the scope of hospitals and medicine as a powerful, fast moving public benefactor and enterprise—a field employing in New York State

130,000 physicians
50,000 dentists
150,000 nurses
100,000 attendants, and

Whereas, the great chain of New York City hospitals, because of their magnitude and service to the extraordinary multitude of people situated in New York City and exhibiting its importance in rank in the vital statistics which show that some 2,000,000 people are regularly employed to take care of those who are sick—that more than 2% of the people are sick all of the time—that 80% to 90% are sick more or less and about 20% of the people are possible candidates for hospital beds, and that over 11% of the people are infected with syphilis—many thousands of these cases never reaching the hospitals, but are treated in clinics and in other places, and later in life reach our State hospitals for the insane in alarming numbers. 95% of all men indulging in promiscuous intercourse in large cities contract gonorrhea at some time in their lives. 60% to 80% of all operations performed on the childbearing tract of women are due to being infected one time or another with gonorrhea. 25% of all the blindness in large cities is due to the ravages of gonorrhea. More than 52% of the patients in our hospitals are afflicted with diseases of the brain and nervous system. The total number of patients treated in hospitals of the country in 1933 was some 1,961,836, equal to 10% of our population, and

Whereas, the expense in the handling of these so afflicted is equal to an annual expenditure of some two billion dollars, and

Whereas, These statistics point and draw our attention to the proportionate masses of people treated in our New York City Hospitals, and to take care of this great number, our hospital system and facilities must be reorganized and operated on a big scale and in a highly efficient manner to take care of the greatest number of people and with the greatest dispatch. What effective hospital and clinic treatment means to cope with the inroads of disease and protect as well, innocent men, women and children from these highly contagious diseases in the large City of New York, should be represented in the superior safeguards these hospitals set up to afford every possible protection to human mankind, and

Whereas, When it is considered that the average expense to most states and cities for the care and treatment of its indigent—blind—sick and insane is equal to approximately from 20% to 22% of their entire yearly earnings, it is not difficult to understand from a human and economic point of view why the greater the human derelicts falling back on the City as incurable and permanently disabled—the greater are the years of hospitalization—with millions of dollars expense to the taxpayer, and

Whereas, We must consider the most serious humanitarian interest, as well as a great finan-

cial issue in which the City of New York must of necessity at all times participate—along with the taxpayer, so long as the vicious circle exists in hospitals and continues to exist as it does in our present day system of hospital operation where faulty and bad supervision and improper hospitalization of patients contributes to added chronic invalids, and

Whereas, Apparently our high City and State officials have never appeared thoroughly awakened to the far reaching factors of consideration that are locked up in the colossal expenditures touching on the maintenance and operation of our hospital system and what faulty, obsolete methods can be responsible for in terms of human disaster and almost insurmountable tax burdens. It seems almost unbelievable that a subject so vital would be allowed to stand without frequent investigation and survey, and

Whereas, It is of the opinion of the authorities that after an investigation is made some plan might be formulated where publications of textbooks on management and operation of hospitals written for the benefit of those who are interested in becoming hospital executives, and

Whereas, It has come to the public notice and with shocking indignation that the present methods of operating the hospitals of New York City are in constant violation of all sound principles of modern operation and supervision as has been proven by the hundreds of complaints to representatives of the people, setting up as these complaints do, improper management practiced in nearly every branch of this service, the result of inefficient and ineffective treatment of patients lack of close-up individual supervision and proper co-ordination of department heads, wasteful and defective administration, resulting in serious and permanent harm to patients with consequent loss of life. The entire structure is top heavy with too many poorly trained useless executives, whose function serves no good purpose, either for the immediate care or supervision of the great mass population of these hospitals, or for the good of the institutions in general, and which executives are believed to be a source of combat to each other and a disturbing influence in the finer and more delicate adjustment of adequately supervising the dire need and scientific treatment of the patients in general, and

Whereas, It is believed that unless these hospitals are immediately and systematically subjected to the closest scrutiny and finest kind of judgment, and are manned by known, practical, expertly trained hospital directors, numbers of human beings will go on being neglected and sacrificed physically, mentally or morally, and these hospitals will fail most

miserably to function in the best interests of humanity

Resolved (if the Senate concur), That a joint legislative committee be and is hereby created consisting of three members of the Senate, appointed by the temporary president of the senate, and five members of the Assembly, to be appointed by the Speaker of the assembly, that such committee shall as speedily as possible following its organization meeting proceed to examine, investigate and survey the entire system, structure and administration of the city and privately owned hospitals located in the City of New York, and it is further

Resolved (if the Senate concur), That such committee be and is hereby authorized to choose from its members a chairman and a vice-chairman, employ counsel and such other employees and assistants as may be necessary for the proper performance of the work of the committee and fix the compensation of all employees out of the amount provided herein therefor, and that such committee shall generally have all the powers of a legislative committee as provided by law, and it is further

Resolved (if the Senate concur), That such committee shall report its findings to the legislature on or before February first, nineteen hundred thirty-eight, and shall submit along with such report such drafts of legislation as may be necessary effectively to carry out its recommendations, and it is further

Resolved (if the Senate concur), That the sum of Fifty Thousand Dollars (\$50,000 00), or so much thereof as may be necessary, be and it is hereby appropriated from the contingent fund of the legislature to defray the expenses actually and necessarily incurred by the committee in the performance of its duties hereunder. Such moneys shall be paid on the audit and warrant of the comptroller upon vouchers or certificates therefor approved by the chairman of the committee

any of the surgical and therapeutic procedures outlined above

5 Although this amendment confers authority for such extension of practice, would the osteopaths undertake it?

Who knows? None would undertake what they knew they could not do, but how can they know the full influence of drugs without having studied them and been trained in their use? Osteopaths are human and will not long have authority without employing it

It rite to your assemblyman immediately filing your protest, and give your reasons

Bulletin No 8
March 13, 1937

The following bills have been introduced since the issuance of our last bulletin

Senate Int. 1118—Feld, Assembly Int. 1573—Miss Byrne, for registration of nurses, continuing board of examiners and prescribing rules and regulations, also for appointment of advisory council by department. Referred to the Education Committee

Comment At a hearing given this bill as well as the other nurse bills, on March 9th, it was opposed on the ground that it would lower educational standards by admitting to licensure girls who could not meet the educational requirements of our present law

Senate Int. 1223—Wojtkowiak, Assembly Int. 1672—Wadsworth, creates the New York State Mineral Authority to transfer Saratoga Springs Reservation Referred to the Finance Committee in the Senate and the Health Committee in the Assembly

Comment The popularity of the work done by the State in developing the Saratoga springs has stimulated people in other parts of the State, where mineral springs are located, to ask for similar interest, and a number of springs have been investigated by commissions of the Legislature in the last two or three years This bill proposes an extension of the Saratoga Commission with the idea of promoting and developing some of the other springs

Senate Int. 1228—Garrity, Assembly Int. 1675—Fite, amends the General Municipal Law to provide that a volunteer fireman injured in performance of duties must be received in any hospital for care and treatment at usual ward patient rates or at rates specified in contract, if there is one with municipality Referred to the Cities Committee

Senate Int. 1317—Kleinfeld, amends the Education Law, adds new section to the General Municipal Law, defining radiology, prohibiting practice except by certain persons, and empowering municipalities to grant permits to physicians, dentists, and osteopaths to conduct radiology laboratories Referred to the Education Committee

Comment A court decision some years ago interpreted the taking of x-ray pictures as equivalent to taking a picture with any camera, and stated that so long as no attempt was made to diagnose or attach significance to the shadows recorded, the operator was not engaging in the practice of medicine The medical profession has always taken exception to this opinion and this bill is intended to correct that situation It also carries a penalty for violation

Assembly Int. 1558—G B Parsons, amends the Lien Law to extend hospital liens for treatment and care of persons injured as result of negligence, to injuries received within one month instead of one week prior to admission, and to verdicts, etc rendered in action by husband, parent or guardian for expenses or loss of service, and extends time of such lien from one to three years Referred to the General Laws Committee

Assembly Int. 1585—McLaughlin adds new section to the General Municipal Law, giving municipal corporation power to adopt sanitary and health regulations for, and to license and inspect, roadside cottages at annual fee not to exceed \$25 00 Referred to the Cities Committee

Assembly Int. 1603—Hawkins, adds new section to the Public Health Law, by appropriating \$1,000,000 as revolving fund in the Health Department for buying and distributing pneumonia serum Referred to the Ways and Means Committee

Comment The publicity which has resulted from the activities of the Pneumonia Control Committee is producing an increased interest in serum treatment The State and the City of New York have been able to meet the demands for serums for Types I and II, but they have no Types V, VII, and VIII products These are produced commercially and seem valuable enough for the State to produce One million dollars is more than would be needed, but the sponsor of the bill realizes that sums of money appropriated are rarely as large as those requested

Assembly Int. 1605—Milroe, amends the Education Law requiring applicants for license to practice osteopathy to pass an examination of state medical examiners

Brief in Opposition

In considering the advisability of enacting into law this amendment requested by the osteopaths, a number of matters should first receive due consideration. It is claimed by them, and rightly, that they must pass the same State Board examination that is set for physicians, but this is only a part of the story because in order to enter that examination physicians must show that they have studied and successfully passed courses in pharmacology and *materia medica*, and osteopaths must show that they have passed a course in the principles of osteopathy. Fully one-half of the osteopaths who are practicing in this State at present graduated when their schools were fundamentally opposed to recognizing that drugs had any value. If they spoke of drugs at all, they admitted that they did so in order to show by contrast their therapeutic inefficiency. The schools in those days taught anatomy and bloodless surgery. Within the last two years their schools have raised their educational requirements so that they are now equal to those required of physicians, but these changes will only benefit future candidates for licensure and can have little or no effect upon the qualifications of those who are now licensed in the State.

1 The bill states what surgery osteopaths *may not* perform, but are there not other surgical fields that this would give them authority to work in?

It would give them authority to treat compound fractures, open wounds, so long as the amputation of an extremity or the opening of the abdomen, chest or skull were not required, to treat burns, infections of the hands or feet—these are among the most troublesome conditions that confront the surgeons—and surgical treatment of conditions of the mouth and nose.

They could also undertake what surgery might be required in conditions of the eye, the ear, or the rectum, except when those conditions were caused by malignant growth.

2 What objection can there be to permitting them the use of narcotics, anesthetics, and antiseptics?

These are not specific names but indicate groups of drugs. For instance, some of the *narcotics* that would be made available are paraldehyde, opium, heroine, laudanum, trional, urethane, morphine, bromides, veronal, chloral, codeine, scopolamine. Some of the most powerful drugs that are used by physicians are included in this group and great care must be exercised in their administration.

Authority for using the following *anesthetics* would be conferred by this bill: chloroform, ethylene gas, ether cocaine, nitrous oxide gas, and novocain. The administration of an anesthetic is recognized by physicians as a highly dangerous procedure, and a knowledge of anesthetics is rapidly growing to be a specialty in the practice of medicine. It would permit them to employ regional and spinal anesthesia.

There are plenty of mild, harmless *antiseptics* purchasable anywhere, but there are also very powerful antiseptics that can not be purchased except at drug stores and most of them only as prescribed. Among these are potassium permanganate, iodoform, sodium arsenate, arsphenamine (salvarsan, 606), neoarsphenamine (neosalvarsan), formaldehyde (formalin), urotropin, Dakin's solution, Balsam of Peru, chrysarobin, ichthyol, atoxyl, phenyl salicylate, iodine, bichloride of mercury, acriflavine, tryparsamide, and argyrol.

Among the *vaccines* that would be made available are smallpox vaccine, typhoid vaccine, staphylococcus vaccine, gonococcus vaccine, scarlatinal vaccine, pneumococcus vaccine, dysentery vaccine, tuberculin, streptococcus vaccine, influenza vaccine, and cholera vaccine. Vaccines are not administered by the mouth, but must be introduced by hypodermic needle either beneath the skin, into the muscle, or into the veins. These are not simple procedures but should be undertaken only by persons who have been thoroughly trained.

The *antitoxin* group is not so large, but their administration is very difficult and should only be done by persons thoroughly trained in their use.

3 Would osteopaths under this bill have authority for treating the venereal diseases?

They would be able to use salvarsan, mercury, and bismuth, which are the drugs that are used for killing or inhibiting the spirochete. They would also have authority for treating gonorrhea both with antiseptic irrigations and with vaccine.

The diagnosis and treatment of the venereal diseases are so difficult and highly specialized that physicians have found it necessary to take special courses of training in order to qualify themselves. And when we consider the prevalence of these diseases and their serious nature, it is obvious how very unwise it would be to grant the osteopaths or anybody else with less training than a physician, authority to treat them.

4 Do osteopaths have hospital facilities?

They do not, and until they do it would be very dangerous for them to undertake

PRIZE FOR REPORT ON CASES OF PNEUMONIA

The Advisory Committee on Pneumonia Control of the New York State Department of Health offers a prize of one hundred dollars for the best report of a series of cases of pneumonia

The competition is open to all physicians residing and practicing in New York State outside of New York City. Interns in hospitals may compete but the report in all cases should include only those cases actually seen and studied by the writer, and should include all cases of pneumonia of all types and forms treated by him either in private practice or in hospitals during the present winter

In awarding the prize less stress will be laid upon the number of cases than upon the objectivity exhibited by the writer in his description of the cases and upon the originality and independence shown in the interpretation of the clinical features. Credit will be given for the extent to which the newer methods of diagnosis and treatment of cases of lobar pneumonia were employed. If the writer desires, the report may be documented by full clinical histories and laboratory reports, but the report itself should not be longer than 5,000 words and be in a form suitable for publication in the NEW YORK STATE JOURNAL OF MEDICINE

Reports should be in the hands of the Committee not later than August 15 and the award will be made October 1

Address further inquiry to

Dr Edward S Rogers,
Director, Bureau of Pneumonia Control,
New York State Department of Health,
Albany, N Y

prescribed for all physicians, license not to entitle holder to perform any surgical operation for opening a natural body cavity, removal of cancer or other tumor and certain other major operations Referred to the Education Committee.

Comment This bill was originally introduced in 1934 by Mr O'Mara The osteopaths report that they have the approval of the Regents for its reintroduction The brief in opposition to the bill, which you received a few days ago, we believe will convince you that the amendment is vicious and should be vigorously opposed If you have not already expressed your opposition to your Assemblyman, please do so at once. *This is very important*

Assembly Int. 1650—Steingut, adds new section to the Public Welfare Law for central bureau of hospital clinics in each public welfare district to make rules for medical, surgical or other treatment in hospital clinics maintained by municipality or visited by State Charities Board Referred to the Relief and Welfare Committee.

Comment Several years ago this bill was before the Legislature and we endeavored to have it enacted into law The opposition,

however, came from the small welfare districts and probably this bill will have to be amended so as to make it apply to welfare districts in the larger cities only

Assembly Int. 1657—Fitzpatrick, adds new section to the Greater New York Charter, conferring exclusive jurisdiction on the health department in supervision of health conditions on all transit lines or other public conveyances operated within limits of city, to preserve human life or to care, promote or protect health and prevent unsanitary conditions and overcrowding Referred to the New York City Committee.

Action on Bills

JOHN J MASTERSON

LEO F SIMPSON

CRIMINAL ABORTIONS AND REPUTABLE PHYSICIANS

Under this heading the *New England Journal of Medicine* discusses the problem that faces the ethical doctor when he is called in to treat a woman who is suffering, perhaps dying, after a criminal operation "What is the duty of the physician?" it asks, and continues

First of all, of course, it is to do his utmost to restore the patient to health, if possible But is that all? Has he no duty as regards the person who committed the crime? Does his consecration to the care of the sick include protection to the criminal? Would it not be at least part of preventive medicine to assist in protecting other persons?

The harm done by the criminal abortionist has reached such proportions that there are some persons who advocate the compulsory reporting by physicians of all abortions, just as

every gunshot wound is required by law to be reported, if the patient comes to a physician for treatment.

It may be that the compulsory reporting of abortions would not be necessary or wise or even expedient. But at the present time there seems to be a widespread indifference on the part of reputable physicians, in the matter of preventing criminal abortions, for they offer no assistance looking toward the apprehension of the abortionist. Would it be too much to ask that, in case a criminal abortion is suspected, the physician consult the medical examiner promptly instead of waiting until the death of the patient? It may be that no lives could be saved by calling the attention of the medical examiner to these patients when once blood-poisoning has gained control of the body, but if even a few other deaths could be prevented by checking the abortionist, a distinct service to humanity would be rendered.

A JURY'S LESSON TO THE JUDGE

An English jury in January awarded £490 damages to Mr Frederick W Sones, of Ilford, against George C Foster, a "nature cure" practitioner, for the loss of his left leg after treatment by Foster Despite a very sympathetic summing up by the judge, who seemed to have a high opinion of unorthodox healers, the jury

found for the plaintiff They found Foster guilty of breach of duty in the advice and the treatment which he gave, and awarded Mr Sones a return of £40 in respect of the fees which he had paid They awarded him £50 as a form of solace for unnecessary pain and suffering, and £400 for the loss of his knee

Annual Meeting

Important Data Concerning Accommodations, Transportation, etc

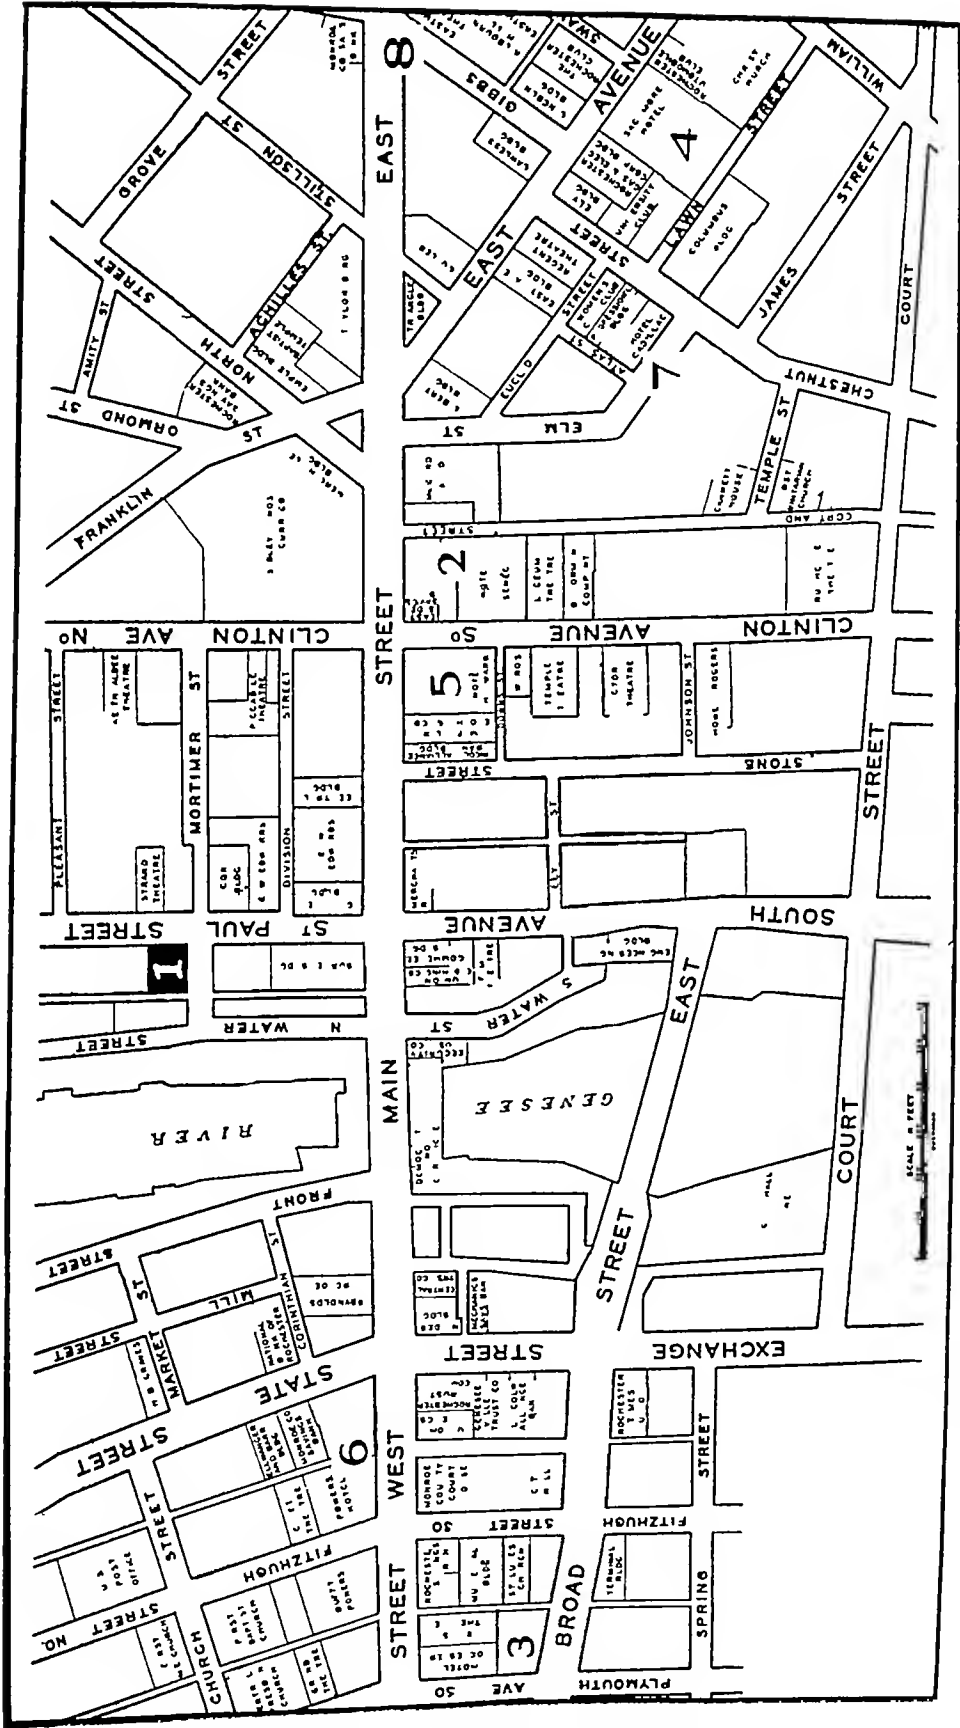

A Portion of Rochester's Central Industrial District

In Rochester, on May 24, 25, and 26 the largest attendance of any up-state meeting is evident from early requests for information on available hotel and transportation facilities. Members planning to attend are urgently requested to make hotel reservations as early as possible, as the most convenient hotel accommodations are being rapidly absorbed. Dr. Austin Morris, Chairman of the Hotel Committee, reports ample hotel facilities for all who wish to attend the meeting—but naturally preferred locations and rooms require reservations to be made sufficiently in advance. For the information of members a map is published showing the proximity of recommended hotels to the site of the meetings. Reservations should be made directly with the hotels. For the information of doctors attending, the following railroads enter Rochester—New York Central, Baltimore and Ohio, Pennsylvania, Lehigh Valley, and the Erie. Seventeen bus lines are also available for those living near Rochester.

Public Health News

Carbon Dust and Tuberculosis

The common statement that coal miners have a high resistance to tuberculosis has been accepted without serious challenge for years. The blackened lung of a coal miner seen at autopsy is an impressive sight, but the very presence of carbon in the pulmonary tissue often tempts the pathologist to exclude tuberculosis without further search. Recent studies, however, indicate that we shall probably have to revise our ideas concerning the protective value of carbon particles in the lung. M. J. Sakoloff,¹ in an article on anthracosis and tuberculosis demonstrates that coal mining of today is a hazard predisposing to tuberculosis. Excerpts of the article follow:

Tuberculosis is comparatively uncommon in workers exposed to dusts of carbon, lime and marble while those who work in an atmosphere laden with silica particles are particularly susceptible to tuberculous infection. Coal dust is the only one to which is attributed the property of inhibiting the development of tuberculosis. Attention was called to the high resistance of coal miners to tuberculosis as early as 1862 and since then evidence has been presented that carbon particles in the lung do exert a protective influence. During recent years, however, several investigators have reported that coal miners die from tuberculosis with greater frequency than the average of the total population. And in a group of 100 old and retired coal miners in Wales, tubercle bacilli were found in the sputum of six on the first examination.

It is probable that conditions under which modern miners work may explain the discrepancy between the older and more recent surveys. Formerly hand drills were used exclusively. In order to avoid the hard rock most of the drilling was done directly into the coal along the edge of the vein. The dust consisted of rather large particles which as a rule settled quickly. Thus the miner was exposed to almost pure carbon dust and, because the particles were large, symptoms of pneumoconiosis did not appear before exposure of from twelve to fifteen years.

In the modern coal industry the pneumatic drill or "jackhammer" is used. The dust created by this instrument consists of fine particles which at times is blown back with great force into the face of the operator and some remains suspended in air for many hours. Inhalation of this fine highly concentrated dust may result in

severe respiratory impairment after an exposure of only three or four years.

The pneumatic drill has made it practicable to mine small veins of coal which under the old method were considered too insignificant and time-consuming to remove. To reach these small veins it is necessary to drill directly into rock and this increases the hazard to the present-day coal miner by adding to the coal dust a great amount of fine silica particles. Analysis of the dust of certain anthracite coal mines showed that at times concentration may be as high as one billion particles per cubic foot of air (average 124 million) and that certain of these dusts contain as much as thirty per cent of free silica. Uncomplicated anthracosis such as was common among miners of the old type has been replaced in the modern miner by fibrosis of the lung associated with silica deposits.

To determine the frequency of tuberculosis as a complication of anthracosis, observations were made upon a group of anthracite coal miners institutionalized because of disabling chronic pulmonary disease. Only those patients who had remained under treatment for two months or more were included. The group consisted of 418 men varying in age from twenty-one to sixty-seven years and whose period of exposure to mine dust ranged from three to fifty years. The average age was about forty-three years and the average exposure period nineteen years. All of these men had used the "jackhammer" periodically. Surface mine workers were not included.

In forty-two of these patients the lesions resulted solely from the action of mine dust, in fifty-seven per cent evidence of co-existing tuberculosis was found and in the small remainder non-tuberculous pulmonary complications occurred. The age-incidence study showed that tuberculosis appears later in life among these mine

Airplane view of Eastman Kodak Park showing residential section, homes of employees. The Eastman Kodak Co, manufacturers of films, plates, paper, chemicals, etc., consists of eighty-three buildings forming the world's largest photographic plant.

Medical News

Bronx County

DR. WARREN F. DRAPER, Assistant Surgeon General of the U. S. Public Health Service, addressed the Bronx County Medical Society at Burnside Manor on Feb. 17, on "The Social Security Act in Relation to the Medical Profession."

Cattaraugus County

A POSTGRADUATE COURSE in obstetrics for the physicians of Cattaraugus and Allegany counties was given on the Sundays of February at the Olean General Hospital under the auspices of the Committee on Public Health and Medical Education of the Medical Society of the State of New York. Dr. Thomas P. Farmer, chairman.

Cayuga County

AT A REGULAR MEETING of the Cayuga County Medical Society on Feb. 18 in Auburn City Hospital, with Dr. Donald M. Green, president of the society, presiding, the society acted unfavorably on the proposal for a survey along the lines of instruction and care of mothers and young children in Auburn, according to reports in the Auburn papers.

Doctor Green, when asked about the matter, stated that the doctors did not consider such a survey necessary for Auburn "in view of the fact that Auburn has a very good record in this matter—comparable with the best." The Auburn *Citizen Advertiser* says that this view was directly opposite to that expressed by Dr. John W. Copeland, health officer, who told a meeting of the Women's Auxiliary of the Cayuga County Medical Society that "there is great need for such a survey in Auburn" and that the city has "a higher death rate of mothers than any other city in the state in comparison to its population."

The meeting of the Cayuga County Medical Society was addressed by three Syracuse physicians, Dr. O. W. H. Mitchell, professor at Syracuse University, Dr. T. F. Laurie, of the Bureau of Venereal Diseases, Syracuse Department of Health, and Dr. O. D. Chapman, director of Syracuse City Laboratory.

The Syracuse doctors spoke in regard to control of venereal disease. A program for study of that problem will be conducted in Auburn in April.

Chautauqua County

"DISEASES OF THE PERIPHERAL VASCULAR SYSTEM" was discussed by Dr. Carroll J. Roberts, professor of medicine of the University of Buffalo, at the meeting of the Jamestown Medical Society on Feb. 25. At the next meeting on April 29, Dr. Douglas P. Arnold, attending physician of the Buffalo Children's Hospital, will speak on "Nephritis in Children." Dr. F. H. Clark will open the discussion.

Erie County

"A DOCTOR'S DIARY," motion picture production which was shown recently on the screen of one of the local theaters drew the fire of the Medical Society of Erie County on Feb. 15.

Formal attention of the physician's group was called to the picture by Dr. Charles W. Bethune as chairman of the board of censors of the county society, who scored the production as "unfair and untrue and not conformable with the ethics of organized medicine."

The society voted to send a letter of protest to Will Hays, movie czar, and the producers of the picture.

Unanimous approval of the so-called Detroit plan for elimination of "unfair competition" by public agencies with private physicians was voted.

The plan would return to the private physician much of the preventive health work now being done by the Department of Health and the Buffalo City hospital.

The approval was voted after Dr. Frederick W. Filsinger, chairman of the health survey committee, had read a report stressing the benefits that the plan would bring both to the medical profession and the public at large.

As a first step towards putting the plan into operation, the society instructed its public health committee, headed by Dr. Nelson W. Strohman, and two members of the health survey committee, Dr. John D. Naples and Dr. Conrad A. Mietus, to work out preliminary details. The committee then will seek the active co-operation of the Board of Health.

Fulton County

DR. M. STANTON read a paper at the

workers than it does in the general population, almost half were between forty-one and fifty year of age while only eight per cent were in the twenty-one to thirty age group. The incidence of tuberculosis varied directly with the amount of dust present in the lung.

The type of tuberculosis which complicates anthracosilicosis differs materially from that which is usually seen. It does not extend progressively downward from the apical or subapical region, but is found scattered throughout the lungs among the silicotic nodules. The tuberculous lesion is usually of slow evolution, is always present in both lungs and consists mainly of caseous nodules varying in size from a split-pea to a walnut. Tendency towards cavitation is great, demonstrable cavities being found in forty-three per cent of the patients. The excavations may attain tremendous size, sometimes occupying almost an entire lobe. They are often multiple and may occur anywhere in the lungs, but the larger ones are usually found in the upper lobes. Caseous pneumonia occurs as a terminal event in many instances. Extensive plastic changes in the pleura are nearly always associated. Effusion occurs infrequently.

The clinical picture of anthracosilicosis co-existing with tuberculosis may be either non-toxic or toxic. In the former type the patients present the usual symptoms of pneumoconiosis, dyspnoea, cough, expectoration and chest pains with slight fever in a few instances. Impairment of general health is slight. These cases are usually considered simple anthracosilicosis until attention is called to the tuberculosis by the discovery of tubercle bacilli or by roentgen-ray evidence.

The second or toxic form is characterized by extensive cavitations, the clinical picture being that of rapidly progressing tuberculosis. In addition to the local symptoms, there is always severe constitutional disturbance as evidenced by fever, loss of weight, loss of appetite, weakness and profuse sweating. Fever is a predominant feature of this form. It is present throughout the entire course of the disease and is septic in type, the afternoon temperature reaching 103 or 104 F in the majority of patients. Repeated and profuse haemoptyses occur in many instances.

The diagnosis of uncomplicated anthra-

cosilicosis presents no special problem but to determine whether or not tuberculosis coexists is very often a difficult task. The following points should be considered:

- 1 Discovery of tubercle bacilli in the sputum. However, extensive tuberculous disease may be present with consistently negative sputum, or occasionally the bacilli may be present in intermittent showers.

- 2 Serial roentgenographic studies (less valuable in advanced pneumoconiosis).

- 3 Marked constitutional disturbance.

- 4 Physical examination (not usually helpful).

- 5 Frank haemoptysis.

- 6 Pleural effusion (absent in uncomplicated anthracosilicosis).

- 7 Tuberculosis in other organs.

The prognosis depends mostly upon the pathological condition. The pulmonary changes which occur as a result of the inhalation of dust are permanent and cannot be altered in any way by therapeutic measures. In many patients, however, lessening of the severity of local symptoms and improvement in general health may be obtained by a prolonged period of rest in a suitable environment. In advanced pneumoconiosis, this improvement may be only temporary, as death often ensues as a result of acute intercurrent respiratory infections or of myocardial insufficiency. The addition of tuberculosis contributes immeasurably to the gravity of the prognosis. When this combination is present in the non-toxic form the patient may live for years in comparative comfort. In those in whom toxic variety of combined anthracosilicosis and tuberculosis develops, a fatal termination may occur in a relatively short time.

It is difficult to determine the frequency with which tuberculosis coexists with anthracosilicosis in coal miners because data from death records is concerned chiefly with individuals treated at home and the detection of tuberculosis occurring coincidentally with pneumoconiosis may require prolonged observation, repeated analyses of the sputum and serial roentgenographic study.

The Fifth International Congress of Radiology, which has set before in London in 1925, Stockholm in 1928, Paris in 1931, and Zurich in 1934, will convene in Chicago September 13-17, under the Presidency of

Dr Arthur C Christie of Washington, DC. The Section on Electrolgy, which meets as part of the Congress, will have as Chairman, Dr Norman E Titus of New York City.

April 1, 1937]

MEDICAL NEWS

The Detroit health commissioner commended local authorities for "making a start in the right direction." It was brought out during the medical society meeting at which Dr Henry B Smith, president, presided, that the cooperative disease prevention program is definitely underway here—and was started in a modest way about eight years ago in its first phase, the education and encouragement of medical men to enable complete participation of those interested.

New York County

A NET GAIN IN MEMBERS of 218 for the year was reported to the Medical Society of the County of New York at its annual meeting. This is an increase of 100 above the average for the past five years. "The society is the largest single unit of organized medicine in the United States, perhaps in the entire world," said Dr De Sanctis in his presidential address.

DR. LOUIS PORTNOY was on the program of the Washington Square Medical Society meeting on Feb 25 in the Scudder School Auditorium.

Dr Portnoy gave a clinical case report, a feature by a member of the society at each of the monthly meetings. Dr Byron Stookey and Dr Jesse G M Bullowa were guest speakers.

Oneida County

MEMBERS OF THE UTICA ACADEMY of Medicine heard addresses by Dr John F Erdmann, Post Graduate Hospital, New York, and Dr Charles S Dickson of Utica, at their meeting in Hotel Utica on Feb 18. Doctor Erdmann told of the importance of early operation for removal of the gall bladder.

Those who discussed the subject included Drs Philip L Turner, Arthur R. Grant, Fred J Douglas, C S Dickson, W S Brady, R C Hall, T Wood Clarke, M T Powers, John Rossi and Harold L Pender. Doctor Dickson's paper was on "Tumors of the Small Intestine." He presented three case reports after review of literature on the subject, which was discussed by Doctor Erdmann.

SYRACUSE WOMEN PHYSICIANS were guests of honor at the annual intercollegiate dinner sponsored by the American Association of University Women on Feb 17 in the main ballroom of the Onondaga. Dr Gulielma S Alsop, author, lecturer, and former medical missionary in China, was

guest speaker. "The Anatomy of Personality" was discussed by Dr Alsop.

Oswego County

SETTLEMENT OF A LONG standing disagreement between the Department of Public Welfare and Oswego Hospital and the Oswego Academy of Medicine is expected within a short time.

Dr J F Burden, Dr C K Elder and Manager Edward W McCormack of Oswego Hospital recently discussed the situation with Mayor Richard G Cullivan and City Attorney Harry C Mizen, with the Mayor stating the city would be willing, he believed, to pay \$6 per patient day to Oswego Hospital, for relief cases sent to the institution for care and treatment. This figure would include all medical and surgical care. The Mayor explained to the physicians, a committee of the Academy, could not make a contract with the Academy, but legally was restricted to making any contract drawn for care of relief patients, with Oswego Hospital. The proposal is that the Hospital Board arrange with members of its medical and surgical staffs to perform all necessary services, paying for the work performed from the per diem fee.

The city now pays the hospital \$4 per patient day, and pays the same schedule to physicians and surgeons as they receive from private practice. During the several months this arrangement has been in effect, numbers of patients in the hospital have varied from one or two, to seven or eight, but the cases sent to the hospital principally have been emergency ones.

The next step, it was said, will be a conference between hospital trustees and the Oswego Academy of Medicine, of which members of the Academy will ask re-appointment on the staff of the hospital. The latter now has no staff, all members having resigned months ago, after failure of negotiations by the staff to secure an agreement from the city to pay a lump sum per annum for all staff services performed for relief patients.

THE MEETING OF THE Medical Society of the County of Oswego on March 3 was devoted to a symposium on pneumonia. The speakers were Dr Orren D Chapman, Dr Oliver W H Mitchell, and Dr Charles D Post, of Syracuse.

Rockland County

ABOUT TWENTY-FIVE MEMBERS of the Medical Society of the County of Rockland

regular meeting of the Fulton County Medical Society in Gloversville on Feb 18, on "The Treatment of Hernia by the Truss-Injection Method"

Kings County

REPRESENTATIVE EMANUEL CELLER, speaking at the fifth annual dinner of the Central Medical Council of Brooklyn on Feb 24, advised delay in Congressional action on President Roosevelt's plan to remodel the Supreme Court and urged immediate passage of the Summers-McCarran voluntary retirement bill as a means of "allowing the problem to settle itself"

Declaring that the highest quality of medical service is always the most economical, Dr Thomas A. McGoldrick, president of the Kings County Medical Society, told the 300 diners at the Hotel St. George "No economic scheme for controlling the practice of medicine, no matter how much saving it may appear to effect, will be accepted by the public unless it carries with it a guarantee of the highest quality of service as well"

He said the medical profession would be willing to leave to an informed public the solution of the problem of public health

Dr Irving E. Siris, president of the council, which comprises the six constituent societies of East New York, New Utrecht, Ocean, Williamsburgh, Bedford and East Flatbush, declared that "because of changing economic conditions physicians in general are receptive to any reform that will assure them some financial security"

Dr Siris offered a resolution for future consideration by the county society urging that the President appoint "an impartial committee of physicians representing groups advocating reform to study the various phases of medical activity before legislation is submitted to Congress"

Other speakers were Dr Alfred E. Shipley, deputy commissioner of hospitals, who expressed the sympathy of the commissioners with the profession and declared that they were looking out for their interests, Dr Frank L. Babbott, president of the Long Island College of Medicine, Dr Harold Rypins, secretary of the State Board of Medical Examiners, and Dr Charles H. Goodrich, president-elect of the New York State Medical Society. Dr Murray B. Gordon, chairman of the dinner, was toastmaster

Others on the dais included Dr John B. D'Albora, president-elect of the Kings County Medical Society, and Dr John J. Masterson, past president of the county society

Monroe County

ROCHESTER HEALTH AGENCIES cooperating with the County Medical Society are attempting to cut down the maternal death rate in a campaign which opened March 5 with a luncheon meeting in the Chamber of Commerce. Dr George W. Kosmak of New York, editor of the *American Journal of Obstetrics and Gynecology*, was the speaker. Dr Kosmak is a former president of the Maternity Center Association of New York. The Monroe County Medical Society is providing physicians as speakers before women's organizations to emphasize the need for prenatal care

TWO PRIZE AWARDS of the Rochester Academy of Medicine for 1937, each for one hundred dollars accompanied by a certificate of award, are offered for a thesis contributing to our knowledge of some problem in clinical medicine, (including all its various subdivisions). The Paine Drug Company Award is open only to Academy members. The Bausch and Lomb Award is open to any doctor residing in, or working in a medical institution in, Monroe County who has graduated in Medicine within five years. Recent and present members of the house staffs of hospitals are urged to choose some clinical problem that aroused their interest. The members of the visiting staff will gladly offer advice. The Academy Library will gladly help any one working for either of these Awards in looking up articles bearing on the topic. Copies of the conditions of the Awards can also be obtained from the Academy office. The competition closes on May 1, and all theses to be considered must be received at the office of the Rochester Academy of Medicine before that date.

Nassau County

NASSAU COUNTY CAN SAVE thousands of dollars in public health and hospitalization costs by following a co-operative program of preventative medicine similar to that effected in his home city, declared Dr Henry F. Vaughan, city of Detroit health commissioner on Feb 23

Dr Vaughan was the guest of the Medical Society of the County of Nassau during the day, presenting different phases of the "Detroit program" to members of the Nassau County Tuberculosis and Public Health Committee in its Mineola offices, to social service workers in the surrogate's courtroom, and to the medical society in the Bar Association building

Hospital News

Hospital Care for the Tuberculous—Why? Where? When? and How Much?

HAVEN EMERSON, M.D., *New York City*

Director of the Hospital Survey for New York, sponsored by the United Hospital Fund

Why

THERE IS NO OTHER MEANS of controlling the spread of tuberculosis which has proved so effective, so economical, so practicable and acceptable to the public, the patient's family and the patient himself as early admission and prolonged stay in hospitals built, equipped, organized, and staffed especially for the care of this disease in all its stages. That is why we need hospital beds for tuberculosis.

Nothing that the health department can do in the way of sanitary control of the patient at home, or to separate the sick from the well compares for effectiveness with hospital care of the tuberculous.

The modern surgical treatment and intensive medical management of human tuberculosis has made the hospital of constantly increasing importance. When the "cure" was a matter of deck chairs, milk and eggs, and time, many a home garden, roof, balcony or window tent served about as well as the hospitals of the earlier decades of this century. But today a great variety of operations, of manipulations, of local lung rest to supplement general bodily repose and upbuilding, require a degree of surgical expertness which can be developed best only in a special tuberculosis hospital, of which we have a few notable examples in New York City.

Where

The best place for hospital care for the great mass of tuberculosis patients is in the same general climate as that of their homes and not so far from these that family and friends find it costly in time and money to visit and support them in spirit through

the tedium of the many months of care. There is no climate or location so superior to those to be found within the limits of the city or in the adjacent counties of the State of New York as to warrant the building by the city of hospitals at greater distance. The majority of all tuberculosis patients from New York City can best be treated in hospitals in the borough of their residence, and this should be the policy and prime object of any provision in municipal or voluntary hospitals for tuberculosis of the lungs whatever the stage of the disease. There is a real advantage for patients with tuberculosis of bones and joints to be in a hospital on a sea beach as at Neponsit.

When

When is hospital care for the tuberculous needed? To this we must answer, Now!—and never more than now, when for the first time in many years we are threatened by a rising tuberculosis death rate. It there had not been a long period of neglect of this matter by four successive city administrations beginning with 1918, and if the fine standards and sound plans of the pre-war campaign against tuberculosis had not been sacrificed for an appearance of economy while the city was being systematically looted by its Tammany government we should not be faced with the present dilemma.

The two factors determining the time and amount of hospital expansion for the tuberculous are the growth of the population and the changes in the death rate from the disease. If the death rate falls while the population grows there may be no need of increase of hospital beds for the tuber-

Excerpts from an address at a luncheon of the New York Tuberculosis and Health Association, at the Hotel Pennsylvania, New York City, March 2, 1937

met at the Villa Lafayette, Spring Valley, on February 24, at the Society's third annual Winter Meeting, as reported by Dr W J Ryan, Secretary

Dr George W Unsworth President, read a paper entitled "The Evaluation of the Ideals and Ethics of the Present Day Physician," elaborating on the Hippocratic Oath Dr Eugene W Bogardus, Director, Division of Tuberculosis, Westchester County Department of Health, was the guest speaker He gave an informal presentation of case histories with a demonstration of x-ray films of some of the more interesting cases found in Westchester County

Resolutions of esteem and regret were adopted on the loss of Dr William R Sifler, past president of the society, who died on Feb 5

Schenectady County

DR E MACDONALD STANTON spoke on "Social Medicine" at the meeting of the auxiliary to the Schenectady County Medical Society on Feb 23 at the Ellis Hospital

Suffolk County

THE WOMAN'S AUXILIARY of the Suffolk County Medical Society now has about thirty paid members The President is Mrs W N Barnhardt and the President Elect is Mrs A E Soper At the Riverhead meeting, in October, the Auxiliary was addressed by Dr William H Ross Dr Ross gave a short history of the Auxiliary, as a national, state and local organization, explaining the purposes of the organization and how it could give valuable assistance and support to the Medical Society

The second meeting was held on December 2 This meeting was addressed by Dr A T Davis, Health Commissioner, on the Value of Compulsory Health Examinations of Domestic obtained through an Employment Agency

The third meeting was held on February 24, and was addressed by Dr Elizabeth C Wells

Sullivan County

DR EDWARD S ROGERS, director of the State Bureau of Pneumonia Control, discussed the "General Pneumonia Control Program for New York State" on Feb 24 before the meeting of the Sullivan County Medical Society at the Lenape Hotel in Liberty

Westchester County

THE MEDICAL SOCIETY of the County of Westchester, at its meeting on Feb 16, heard an address by Dr Howard W Haggard, Associate Professor of Applied Physiology at Yale University, on "Medicine in the News"

An invitation has been accepted from the Nassau County Society to hold the Third Annual Joint Dinner Meeting and Golf Tournament in Nassau County late in May or early in June

DR LISLE B KINGERY was elected President of the White Plains Medical Society at its Annual Meeting Dr E C Wood was elected Vice-President and Dr Harry Klapper was re-elected Secretary and Treasurer Governors elected for two year terms were Dr D A MacDonald, the retiring President, and Dr D C McElligott Dr Milton A Bridges, Associate in Medicine at the New York Post-Graduate Medical School, spoke informally on diet therapy An interesting discussion followed

THE REGULAR MEETING OF THE Medical Society of the County of Westchester was held on March 16 at the New York Hospital, Westchester Division, White Plains The speaker was Dr John F Erdmann whose title was, "The Treatment of Cholecystitis, Cholelithiasis and Cholangitis"

THE COUNTY MEDICAL Society will celebrate its 140th Anniversary with a Banquet at the Hotel Biltmore in New York City, April 20

THE LATE DR JOHN J THOMSON, chief of the eye, ear, nose and throat departments of the Mount Vernon and Bronxville hospitals, left a gross estate of \$333,415 when he died on November 13, 1935, according to a transfer tax appraisal filed recently by the State Tax Bureau in Surrogate's Court

Dr Thomson was prominent in the medical profession throughout the East, being a member of many groups, and for fourteen years president of the medical board of the Mount Vernon Hospital

His estate included real estate, valued at \$28,500, securities, \$26,366, including seventy-five shares of the Tuckahoe Home-Building and Loan Association, \$12,273, mortgages, \$272,894, cash, \$4,128, insurance, \$1,012, and miscellaneous assets, \$315

After bequeathing a legacy of \$9,000 to his brother, James E Thomson of Los Angeles, Dr Thomson left the remainder of his estate to his wife, Mary K Thomson of Mount Vernon

Mrs Thomson and F Irving Hull of Bronxville, N Y, are the executors

Hospital Care for the Tuberculous—Why? Where? When? and How Much?

HARVEY EMERSON, M D, *New York City*

Director of the Hospital Survey for New York, sponsored by the United Hospital Fund

Why

THERE IS NO OTHER MEANS of controlling the spread of tuberculosis which has proved so effective, so economical, so practicable and acceptable to the public, the patient's family and the patient himself as early admission and prolonged stay in hospitals built, equipped, organized, and staffed especially for the care of this disease in all its stages. That is why we need hospital beds for tuberculosis.

Nothing that the health department can do in the way of sanitary control of the patient at home, or to separate the sick from the well compares for effectiveness with hospital care of the tuberculous.

The modern surgical treatment and intensive medical management of human tuberculosis has made the hospital of constantly increasing importance. When the "cure" was a matter of deck chairs, milk and eggs, and time, many a home garden, roof, balcony or window tent served about as well as the hospitals of the earlier decades of this century. But today a great variety of operations, of manipulations, of local lung rest to supplement general bodily repose and upbuilding, require a degree of surgical expertness which can be developed best only in a special tuberculosis hospital, of which we have a few notable examples in New York City.

Where

The best place for hospital care for the great mass of tuberculosis patients is in the same general climate as that of their homes and not so far from these that family and friends find it costly in time and money to visit and support them in spirit through

the tedium of the many months of care. There is no climate or location so superior to those to be found within the limits of the city or in the adjacent counties of the State of New York as to warrant the building by the city of hospitals at greater distance. The majority of all tuberculosis patients from New York City can best be treated in hospitals in the borough of their residence, and this should be the policy and prime object of any provision in municipal or voluntary hospitals for tuberculosis of the lungs whatever the stage of the disease. There is a real advantage for patients with tuberculosis of bones and joints to be in a hospital on a sea beach as at Neponset.

When

When is hospital care for the tuberculous needed? To this we must answer, Now!—and never more than now, when for the first time in many years we are threatened by a rising tuberculosis death rate. If there had not been a long period of neglect of this matter by four successive city administrations beginning with 1918, and if the fine standards and sound plans of the pre-war campaign against tuberculosis had not been sacrificed for an appearance of economy while the city was being systematically looted by its Tammany government we should not be faced with the present dilemma.

The two factors determining the time and amount of hospital expansion for the tuberculous are the growth of the population and the changes in the death rate from the disease. If the death rate falls while the population grows there may be no need of increase of hospital beds for the tuber-

Excerpts from an address at a luncheon of the New York Tuberculosis and Health Association, at the Hotel Pennsylvania, New York City, March 2, 1937

met at the Villa Lafayette, Spring Valley, on February 24, at the Society's third annual Winter Meeting, as reported by Dr W J Ryan, Secretary

Dr George W Unsworth President, read a paper entitled "The Evaluation of the Ideals and Ethics of the Present Day Physician," elaborating on the Hippocratic Oath Dr Eugene W Bogardus, Director, Division of Tuberculosis, Westchester County Department of Health, was the guest speaker He gave an informal presentation of case histories with a demonstration of x-ray films of some of the more interesting cases found in Westchester County

Resolutions of esteem and regret were adopted on the loss of Dr William R Sitler, past president of the society, who died on Feb 5

Schenectady County

DR E MACDONALD STANTON spoke on "Social Medicine" at the meeting of the auxiliary to the Schenectady County Medical Society on Feb 23 at the Ellis Hospital

Suffolk County

THE WOMAN'S AUXILIARY of the Suffolk County Medical Society now has about thirty paid members The President is Mrs W N Barnhardt and the President Elect is Mrs A E Soper At the Riverhead meeting, in October, the Auxiliary was addressed by Dr William H Ross Dr Ross gave a short history of the Auxiliary, as a national, state and local organization, explaining the purposes of the organization and how it could give valuable assistance and support to the Medical Society

The second meeting was held on December 2 This meeting was addressed by Dr A T Davis, Health Commissioner, on the Value of Compulsory Health Examinations of Domestic obtained through an Employment Agency

The third meeting was held on February 24, and was addressed by Dr Elizabeth C Wells

Sullivan County

DR. EDWARD S ROGERS, director of the State Bureau of Pneumonia Control, discussed the "General Pneumonia Control Program for New York State" on Feb 24 before the meeting of the Sullivan County Medical Society at the Lenape Hotel in Liberty

Westchester County

THE MEDICAL SOCIETY of the County of Westchester, at its meeting on Feb 16, heard an address by Dr Howard W Haggard, Associate Professor of Applied Physiology at Yale University, on "Medicine in the News"

An invitation has been accepted from the Nassau County Society to hold the Third Annual Joint Dinner Meeting and Golf Tournament in Nassau County late in May or early in June

DR. LISLE B KINGERY was elected President of the White Plains Medical Society at its Annual Meeting Dr E C Wood was elected Vice-President and Dr Harry Klapper was re-elected Secretary and Treasurer Governors elected for two year terms were Dr D A MacDonald, the retiring President, and Dr D C McElligott Dr Milton A. Bridges, Associate in Medicine at the New York Post-Graduate Medical School, spoke informally on diet therapy An interesting discussion followed

THE REGULAR MEETING OF THE Medical Society of the County of Westchester was held on March 16 at the New York Hospital, Westchester Division, White Plains. The speaker was Dr John F Erdmann whose title was, "The Treatment of Cholecystitis, Choledochitis and Cholangitis"

THE COUNTY MEDICAL Society will celebrate its 140th Anniversary with a Banquet at the Hotel Biltmore in New York City, April 20

THE LATE DR. JOHN J THOMSON, chief of the eye, ear, nose and throat departments of the Mount Vernon and Bronxville hospitals, left a gross estate of \$333,415 when he died on November 13, 1935, according to a transfer tax appraisal filed recently by the State Tax Bureau in Surrogate's Court

Dr Thomson was prominent in the medical profession throughout the East, being a member of many groups, and for fourteen years president of the medical board of the Mount Vernon Hospital

desirability of maintaining reasonably cool conditions in the operating room for both patient and operating personnel

The use of air conditioned wards in the treatment of many allergic disorders has found considerable vogue. There is evidence that thermal factors are important in the precipitation of allergic attacks. Many factors appear to precipitate attacks, but the most potent appears to be a sudden temperature change, which may be practically eliminated by air conditioning. There are also many persons who cannot be effectively desensitized to allergens but who can obtain varying degrees of relief from filtration of air borne antigens. It appears, in

fact, that the chief remedial factor in the treatment by conditioned air is the filtration of pollen. This effect can be obtained sometimes by simple filtration without air cooling. However, comfortable temperatures between 75 and 82 F in warm weather and a relative humidity well below fifty per cent appear to be beneficial and desirable.

Enough preliminary work has now been done apparently to indicate the lines along which air conditioning should be introduced into hospitals. Before embarking on any program of air conditioning, Yaglou's report deserves the careful study of all those hospitals now or soon to be in a position to install additional equipment.

Pneumonia Control Program Sponsored by Health Groups

At the present time, a Pneumonia Control Program is being carried on in New York State, under the sponsorship of the State Department of Health, the State Association of Public Health Laboratories, the Metropolitan Life Insurance Company, the Commonwealth Fund, and the Medical Society of the State of New York. The purposes of this campaign may be briefly summarized as follows:

- 1 Early medical care for pneumonia patients
- 2 Laboratory service for rapid type determination and other bacteriological studies
- 3 Increased use of concentrated antipneumococcic sera when this treatment is indicated
- 4 Adequate nursing service for all patients

It has been repeatedly demonstrated that the use of antipneumococcic serum in the types of pneumonia where this is indicated has cut the mortality of this disease remarkably, particularly in Type I pneumonia. Of course, to achieve these results, it is essential that serum be given early in the disease. Fortunately, at the present time, the method of determining the type of pneu-

monia has been greatly simplified and this service is now quite universally available. It is, therefore, readily understood why every case of pneumonia, or suspected case of pneumonia should be typed early. Recent reports, however, indicate that only one-half of hospitalized cases in New York State have had such bacteriological studies. It would seem that the State Hospital Association could aid in correcting this condition by calling this matter to the attention of the staffs of the various hospitals. It is further suggested that the staffs in arranging their regular meetings, give consideration to the subject of pneumonia, and especially with reference to the use of antipneumococcic serum. The staffs of the hospitals can also aid materially in this work by urging all physicians to send in promptly their reports on cases where antipneumococcic serum has been used.

The sponsors of the Pneumonia Control Program are appreciative of the fine co-operation which has already been shown by the management of the hospitals and by the medical profession.

THOMAS P. FARMER

Chairman, Committee on Public Health and Medical Education

Improvements

CITING AN ANNUAL INCREASE of 4,000 in the population of State hospitals and prisons, Gov. Herbert H. Lehman has asked the Legislature to submit to the voters next fall a proposed \$60,000,000 bond issue for capital improvements.

Bills carrying out the Lehman program were introduced by Senator Jeremiah F. Twomey of Brooklyn and Assemblyman Meyer Alterman of New York, Democrats.

"Each year for the past several years," the Governor said, "the population of our hospitals and homes for the mentally sick has increased by about 3,000 patients. This rate of increase is likely to continue. And in addition to providing facilities for new patients, the State will, under an existing law, have to vacate within a few years the State hospital at Ward's Island, now housing 3,500 patients."

culous for many years. But when the death rate from tuberculosis remains stationary, or, as in 1936, actually rises while the population continues to grow then is the time to build quickly and liberally for hospital care, first as an intelligent, economical, and humane provision for the sick, and secondly as a guarantee that we shall further reduce the incidence of the disease in the future. We are at that exact point in the history of this metropolis now and delay means catastrophe.

How Much

The question arises as to the number of hospital beds we need at once and in the future. The most liberal provision among the large cities in the United States is two beds for each death from tuberculosis in the year. The least allowance considered sufficient in the past has been one hospital bed for each annual death from this disease.

In 1936 there were 4,586 deaths in New York City from tuberculosis and the normal capacity of the tuberculosis hospitals was

5,184, while the average census of these hospitals during the year was 5,425 patients.

There are needed now a minimum of 2,500 more hospital beds for tuberculous patients from the resident population of New York City alone, and even with this addition we should fall far short of the provision made by a half dozen other cities of this country.

This would give New York City a ratio of 17 beds per annual death from tuberculosis while Detroit has 23, Milwaukee 20, Buffalo 21, and Seattle has 21 beds per death.

If we added 5,000 beds to our present hospital capacity we should just equal the provision those cities have made. The resulting 10,184 beds would prove none too many for our present population, and would be an economical investment which would suffice for all the hospital needs of the city for this disease until it reaches its expected maximum population in another twenty-five years, and probably for all time thereafter.

Hospital Air Conditioning

NOW IS THE TIME WHEN many hospitals are thinking of the desirability of air conditioning for the approaching summer, and the *Journal of the AMA* takes the occasion to review an article on it by C. P. Yaglou in the *Journal of Industrial Hygiene and Toxicology*. Of course the expense of air-conditioning an entire hospital hardly seems justified. At present it concerns principally nurseries for premature infants, anesthesia and operating rooms, oxygen therapy chambers, heat therapy rooms or cabinets and wards for allergic patients.

Comparative observations of premature infants in conditioned and unconditioned wards demonstrate conclusively the favorable effect of conditioning on stabilization of body temperature. The favorable effect apparently resulted from better control of temperature, superior ventilation methods, suitable provision for cooling the room in warm weather and the comparatively high humidity. Similarly, maximum gain in body weight after the first week of life occurred in the conditioned nurseries under high humidity in infants weighing less than five pounds. The incidence and severity of

digestive syndromes with diarrhea, persistent vomiting, diminishing gains or loss of body weight and other untoward symptoms were generally twice as high under low than under high humidity. Finally, the mortality of premature infants was found to be greatly affected by humidity, achieving its lowest rate in conditioned nurseries under a high humidity of sixty-five per cent or more.

Air conditioning in operating rooms is mainly concerned with the welfare of the patient, the comfort and efficiency of the surgeon and his personnel and the safety of the whole procedure. There is complete unanimity among all workers as to the effectiveness of high humidity on the prevention of accumulation of static, this is therefore an important measure of safety where explosive gases are used. The problem of operating room temperature is a difficult one and not much is known concerning the optimal air conditions necessary to maintain a normal body temperature under the influence of anesthesia and during the immediate post-operative period. What evidence there is, however, points to the

In addition to the sanatorium, the motion picture industry has also contributed memorial wards in the French Hospital and a large tract in Kensico Cemetery which, with the hospital will be administered by the Will Rogers Memorial Fund

. . .

FUTURE VACANCIES IN THE MEDICAL staff of St. Joseph's Hospital will be filled by Yonkers physicians, Dr Michael J Lynch, president of the hospital's medical board, announces as a result of a decision of the board

The action comes as an answer to criticism expressed privately by Yonkers doctors that they have been discriminated against in appointment to the board in favor of New York physicians

ALBERT M LE MESSURIER was reelected president of the board of directors of the Syracuse Hospital Service Corporation at the annual meeting recently

THE NEW WING OF St. Joseph Hospital, Far Rockaway, will be placed in service probably the early part of April, it is announced. The wing, constructed at a cost of more than \$70,000, is nearing completion.

• • •

PLANS FOR THE CONSTRUCTION of a \$500,000 addition to the present Glens Falls Hospital, to double its capacity of 100 patients, are announced by the hospital board of directors through the president, William H. Barber. A drive for funds will be launched April 15 and it is expected that the addition will be completed within a year. The new structure will take the form of a wing on the south side of the present Park Street building, which itself is to be remodeled. The hospital recently acquired a large piece of property on the corner of Sheldon and Park streets, on which the wing will be erected after three houses and the Nurses' Home located there have been demolished.

• • •

A NEW CHILDREN'S UNIT has been added to the Homer Folks Tuberculosis Sanatorium at Oneonta, and the nurses' home is to be enlarged.

• • •

PRELIMINARY PROGRESS is going forward rapidly for the construction of the proposed John Van Brunt Roe Hospital at Patchogue.

DEGRAFF MEMORIAL HOSPITAL at North Tonawanda is putting in a new laboratory.

• • •

THE MUNICIPAL HOSPITAL at Niagara Falls is to be remodeled at a cost of \$45,000. A brick structure will replace the two present frame ones, and new equipment will be installed.

• • •

THE WPA IS MAKING renovations and improvements at Sea View Hospital on Staten Island that will cost \$2,000,000. It is reported that 650 men are engaged in modernization and repair work on 113 buildings situated on 800 acres of hospital grounds.

• • •

THE STATE PLANS to spend \$150,000 on a sewage disposal plant at the Gowanda State Hospital.

• • •

THE BINGHAMTON CITY HOSPITAL is putting in a new interfloor call system, such as is in wide use in many large hospitals.

• • •

THE NEW YORK POLYCLINIC Medical School and Hospital has opened its new X-ray Department. Entirely new and up-to-date equipment has been installed in the new building. The installation is completely shockproof. There are five radiographic rooms to cover all phases of diagnostic roentgenology, and a shockproof mobile unit is included, as well as a complete X-ray Therapy Department.

Newsy Notes

THE GOWANDA STATE Homeopathic Hospital has instituted a new boarding program, which was recently explained by Miss Jessie M. Decker, the hospital's Director of Social Service.

Miss Decker stated that a new plan for boarding patients in private homes, copied from the system used for the mentally ill in Belgium, had recently been inaugurated by the Gowanda Hospital, following successful experience with the plan by various other state institutions, and that at present, Gowanda had ten patients in private boarding homes. It has been found, said Miss Decker, that often a person could be adjusted outside the institution and away from former surroundings, very satisfactorily.

THE WILL ROGERS MEMORIAL Hospital tribute of the motion picture industry to the memory of the cowboy humorist, newspaper philosopher and motion picture star, came into official existence when the deed to the former N. V. A. Sanatorium at Saranac Lake was presented to Jesse H. Jones, chairman of the Reconstruction Finance Corporation and treasurer of the Will Rogers Memorial Commission on Feb. 25.

The presentation, on behalf of the industry and its allied arts, was made by Will H. Hays, head of the Motion Picture Producers and Distributors of America in a ceremony in the studio of Fox Movietone News in New York City.

In addition to the sanatorium, the motion picture industry has also contributed memorial wards in the French Hospital and a large tract in Kensico Cemetery which, with the hospital will be administered by the Will Rogers Memorial Fund

. . .

FUTURE VACANCIES IN THE MEDICAL staff of St. Joseph's Hospital will be filled by Yonkers physicians, Dr Michael J Lynch president of the hospital's medical board, announces as a result of a decision of the board

LORENZ J. BROSNAN, ESQ

Counsel, Medical Society of the State of New York

Proof Required to Establish Malpractice Case

Frequently when a patient undergoes a long period of suffering after an injury, due to his general physical condition, or due to complications over which his attending physician has no control, he seeks to hold the physician responsible on the theory that he should have been able to confine the period of disability to a minimum. An example of such a situation is found in a case very recently decided by the highest court of one of the Mid-western States*.

A young woman, twenty-five years of age sustained a comminuted fracture of her right tibia, five inches below the knee. She was taken promptly to a clinic conducted by Doctors S and A. X-rays were immediately taken, and as soon as the interpretation was available, the fracture was reduced and a plaster-of-paris cast was applied from above the knee to below the ankle. Within a short time she complained of pain, particularly complaining that the cast hurt her. The next day Dr. A. opened the cast to some extent to relieve pressure, and Dr. S. the following day loosened the cast further.

Treatment continued for two weeks with the cast in place, when additional x-rays were taken, and a slight overlapping of the ends of the bone was detected. The doctors thereupon applied a so-called Brown splint, which was described as consisting of a wire inserted through the skin back of the tendon of the heel, to which a weight was applied, with the limb left exposed to permit massage. This form of treatment was continued for nearly three weeks. At that time the bone was found in perfect position and another cast was applied, and the patient went home from the hospital.

At her home Dr. S. continued to care for her from time to time. She frequently complained of pain, but Dr. S. diagnosed no undue swelling or anything other than a gradual healing process. The cast was loosened by him in ten days and in four weeks it was removed. Check up three weeks later showed the patient's condition good.

The patient returned to her work as a

stenographer, and before another month had gone by, she again made complaints to the doctors about pain and soreness in the region of the injury and also in the knee and ankle. She was told to have diathermy treatments. Another period of three months elapsed and the patient went to Dr. L., who found the right leg swollen and red, and apparently painful. After examination, including x-rays, Dr. L. diagnosed an inflammatory process of the bone, above the fracture itself. Dr. L. concluded that care by a bone specialist was needed and sent the patient to the Mayo Clinic where she received treatment.

The patient, it is important to note, was one who in her childhood had suffered from infantile paralysis which had left her right leg somewhat abnormal. About eight years prior to the fracture, she had undergone two operations on the same limb which had been very beneficial to her, although before the fracture that limb was somewhat shortened, and she walked with a slight limp.

The patient brought a malpractice action against Dr. S. and Dr. A. charging them with improper care of her case. The specific charge was made that the defendants had negligently permitted infectious germs to enter the wound and leg of the plaintiff so as to cause her difficulties. Further it was claimed that defendants had negligently failed to diagnose and discover that plaintiff, while under their care, was suffering from an inflammation of the bone.

When the case was tried the facts were brought out to be substantially as outlined above. There was testimony by the plaintiff that, when the first cast was applied, she felt as if the ends of the bone had slipped, and that she had so informed the defendants, and that they had assured her that no such thing could have happened. The doctors called to testify in the plaintiff's case were Dr. L. and a Dr. M., one of the doctors from the Mayo Clinic. Dr. L. did not give any opinion as to the cause of the inflammation or infection, but testified that there is always some inflammation in connection with fractures of the type in question. Dr. M. made no criticism of the care rendered by the defendants. He con-

* Williamson v. Andrews 270 N. W. 6

ceded that Dr S had not caused the inflammatory process, and approved of diathermy as a method of treating the plaintiff's condition. He stated that it was speculative as to when the inflammation started or became manifest, and attributed some of the changes in the leg to the old infantile paralysis.

The Trial Court, however, submitted the case to the jury and a substantial verdict was returned in favor of the plaintiff. The defendants appealed to the highest Court of the State, and that Court determined that upon the record the defendants were entitled to a reversal, and judgment in their favor notwithstanding the verdict. In so ruling the Appellate Court said in part

It appears beyond question that it takes considerable time for a person to recover fully from a comminuted fracture. The healing process causes pain and discomfort. No one can state definitely the healing time. It differs in each individual case, and no rule can be laid down as to the time within which such fracture will fully heal. As a matter of fact we cannot find anything in the case indicating when the inflammation commenced or its cause.

With regard to the ultimate result, one counsel for plaintiff in closing the case to the jury candidly admitted that the bone "grew together in a way that has been praised by every doctor and is entirely satisfactory to us."***

The situation then simmers down to this. Dr L believed the case to be one requiring the expert services of a bone specialist. A recognized specialist was secured. The man so selected failed to find anything wrong either by way of commission or omission on the part of the attending doctor. The injured plaintiff has fully recovered. But she thinks Dr S should have done something (just what is left a dark secret) to discover an inflammatory condition in her leg. Liability is sought to be fastened because as said in her brief "We claim that it is not necessary for us to prove that Dr S caused by his negligence this inflammation. He is liable because he negligently failed to make any diagnosis or attempt to diagnose or discover that plaintiff while under his care, was suffering from inflammation of the bone thus extending and increasing the affliction, the period of the cure the pain and suffering and the expense."***

No one questions Dr S's qualifications. He is an experienced physician and surgeon in good standing and possessed of perhaps more than "the average skill" of members of his profession practicing in his community. Of course, this does not relieve him and his co-partners from liability if he failed to exercise the degree of skill and care required.

As we have already pointed out, the record is barren of expert medical testimony that the inflammatory process in and about the bone of plaintiff's leg was caused by anything done or omitted to be done by Dr S. Neither of plaintiff's experts gave any opinion as to when

this inflammation, other than such as naturally and necessarily resulted from the fracture, commenced or what caused it. Obviously this is a case where opinion evidence of competent medical experts is necessary to establish liability.*** The measure to be applied is whether the physician and surgeon in fact "conducted the operation according to an accepted standard of his profession."

In this, as in negligence cases in general, there must be proof of causal connection between the wrong complained of and the resulting injury. The burden of proving such negligent conduct rests upon plaintiff.

Plastic Surgery on Nose

A sixteen year old girl was brought to the office of a physician specializing in plastic and reconstructive surgery for the purpose of having an operation performed to correct certain conditions affecting her nose. Examination showed that the patient had a long, humped nose deviated to one side and that she had a thickened septum deviated to the right with pronounced obstruction of the nasal passage. The girl complained of considerable difficulty in breathing. The doctor suggested two operations for the purpose of endeavoring to correct the conditions which he found.

Under a local anesthesia, the doctor performed a submucous resection for the purpose of improving the patient's breathing. The patient remained in the hospital but a few days following the operation and her postoperative condition was satisfactory. Approximately three months later, the patient again entered the hospital and the doctor performed a plastic operation to correct the appearance of the nose. Under a local anesthesia, he removed the bony and cartilaginous hump and shortened the nose. He also narrowed the tip of the nose. The patient's recovery from the said operation was uneventful.

Subsequently, a malpractice action was instituted against the doctor in which the charge was made that the doctor had improperly performed the two operations so that the patient's condition was worse than before the operations were performed. The special claim was made that the defendant had undertaken the two operations in reverse order. A physical examination made of the plaintiff before the trial showed that her appearance was extremely satisfactory and that the plastic operation had in fact been beneficial to her.

The case came on for trial before a judge and a jury and during the course of the trial, the plaintiff's attorney consented to a dismissal of the case.

Across the Desk

The "Unsung Hero" of the Great Flood—the Doctor

"BOAT! BOAT URGENT! DOCTOR WANTED!" was the summons we often heard over the radio as we listened in to the calls relayed into our comfortable homes in January from the flood-ravaged regions along the raging Ohio river. And every call found a doctor ready to go. Out in the dark reaches of the swirling waters people were desperately ill, babies were born, epidemic threatened, and in every such need the doctors and nurses were always on the spot.

In fact, now that the medical journals are gathering and publishing the stories, it turns out that county medical societies located far back from the river stood ready, with relief corps fully organized and equipped, but were not needed. Such was the perfection of the medical service on the spot. A trained newspaper writer who never hesitates to throw the brickbat of criticism when deserved, has nothing but bouquets. Westbrook Pegler, visiting one of the deluged cities, wrote that "Evansville and the neighboring country are almost smothered in kindness and loving care." Doctors, he said, "lurk in every doorway with loaded needles, ready to skewer one and all with units of bug-juice against most of the ills that flesh is heir to."

He waggishly suggested that "it is a fine opportunity to have a baby or an appendicitis operation free, and honest ballyhoo against the plagues which used to follow floods probably will have the effect of preventing those plagues." And he frankly recognized what some overlook when he observed that "the heroic medicos have done themselves out of many an honest dollar in their priestly zeal to serve."

Physicians Are Rescuers and Sufferers Too

It must not be forgotten, either, that the physicians who were aiding the flood-sufferers were themselves losing thousands of dollars by the inundation. An Indiana doctor, working over a sick refugee, glanced out the window and remarked, "I think my house is drifting away," and calmly went on with his work. When some one offered

to help, he replied "Young man, what we need most is a good lettin' alone." The doctors were able to handle their job themselves, and did it in a style that will be talked about twenty years hence. Why wait twenty years? Why not give them their due now?

The enterprising Executive Secretary of the Indiana State Medical Association, Thomas A. Hendricks, made a trip in a coast-guard cutter through a part of the flooded area and saw for himself what the doctors were doing. He said over the radio at that time that "the unsung hero of the flood is the local family doctor. He was on the job before the state and national agencies were on the ground. Now he has joined forces and is working with the relief agencies. Long after the flood is gone from the headlines, and the relief agencies have withdrawn and the radios of the nation are turned in once again on Amos and Andy, the local family doctor will be down here in southern Indiana fighting disease and pestilence. He is the unsung hero." Later reports prove that his work was effective, for there has been a remarkably low incidence of contagious disease and very little loss of life.

The Indiana Secretary tells us only of the doctor's work in his own State, reports from other States will come in later, but we have merely to let our imagination duplicate the Indiana picture in Ohio, Illinois, and Kentucky, where the physicians were equally devoted and effective, to form an idea of the entire scene. A doctor working day and night at the medical headquarters in the Evansville coliseum spoke for hundreds more when he said

"As far as water is concerned, I don't even know there is a flood. I've only been out of the coliseum to go to the City Hall and I haven't had a bath for a week."

The "River Rat" and the Doctor

Schools, churches, Legion headquarters, public halls, were turned in a day into hospitals equipped with doctors and nurses. A "five star" feature, we are told, was an

emergency hospital in a church at Aurora Ind., where the records in the first five days of the flood showed 670 out-patients and thirty in-patients. Doctors and nurses worked in these improvised hospitals till they were asleep on their feet. And out on the racing yellow river were other physicians and nurses responding to the incessant calls "Boat urgent! Doctor wanted!"

Some day, says the Indiana Secretary, some genius will write an undying flood yarn of high water and high adventure entitled, "The River Rat and the Doctor." "River Rat" is a high title, it seems, higher than General or Admiral or Colonel for a River Rat is one who knows the channels and the hidden currents and how to compete safely day and night with Old Man River. It was the River Rats who piloted the doctors through the perils of the wild waters on their errands of mercy, and they should have a share in any bouquets that are being handed around. So off with our hats to the River Rats!

Public Health Service Stood a Terrific Test

A terrific strain fell upon the Public Health Service, and it stood up grandly. Urgent calls descended like an avalanche upon the State Board of Health for vast quantities of serums and vaccines, and every call was met. Rush purchases were made of sufficient quantities to immunize thousands.

Then came the hard problem of delivering the medical supplies into the flood area and to the refugee camps, where roads were either dangerous or actually impassable. As we are told by the Director of the Indiana State Board of Health, Dr. Verne K. Harvey, who was in charge of the situation, the state police, national guardsmen, legionnaires, Veterans of Foreign Wars, and many, many others "volunteered as messengers and braved untold dangers and hardships to get the supplies through."

As Dr. Harvey relates it in the state medical journal, he and his entire staff were on twenty-four-hour duty for several days. By a wise arrangement, an engineer, physician, and stenographer listened in on all emergency calls, so that expert attention could be given each situation. Later the purchase and distribution of medical sup-

plies were taken over by the Red Cross. Now the Health Board is busy overseeing the restoration of public and private water supplies, protection of milk and food supplies, disposal of sewage and pumping contaminated water from basements, wells, and cisterns.

A liberal education in health hazards is being given the people in posters and public notices tacked up everywhere.

"Multum in Parvo"

Some masterly examples of terse statement appear in the reports from the county medical societies. Think of the days and

"... what we need most is a good lettin' alone."

nights of heartbreaking labor behind these few words.

"In Mt. Vernon, 2,500 flood refugees were cared for through the efficient functioning of the Posey County Medical Society. Disease effectively held in check. Emergency hospital established in Memorial Coliseum. All refugees inoculated."

And read this crisp report from Spencer County.

"We were swamped with refugees, but with the aid of the State Board of Health, Red Cross, doctors, and nurses, more than 5,000 people were immunized, and no outbreak of contagious diseases developed."

Caesar wrote "I came, I saw, I conquered." Well might the doctors of the

flood region pen a far finer report "We came, we saw, we saved"

A Transformed Distillery

While mentioning the emergency hospitals set up in schools, churches, et cetera, it seems that we must not forget the distilleries. At Lawrenceburg the medical man of the hour was the plant physician of a distillery advertised every day in your newspaper. When the levee "busted," he moved the local medical supplies to the distillery and set up a temporary hospital and first aid station in the main office. A nearby building of the plant was transformed into a commissary and a warehouse blossomed out with 150 cots where wet and hungry refugees found rest and warmth. Local medical men and nurses were organized, and distillery officials put everything at their disposal. Two or three pneumonia patients were treated with oxygen with improvised nasal catheters—all recovered.

The medical situation was "never out of control," we are assured, although Lawrenceburg was almost completely inundated. The only power in town came from the distillery plant boilers, so we can imagine the feelings of everybody when the river rose

and drowned out the boiler fires! But we are reading about people who didn't know when they were licked. When the fires hissed out in a cloud of steam, the plant engineers hooked two locomotives to the plant steam line, and power was never interrupted! These locomotives were used for five days and at one time water was within a few inches of their fire boxes. Emergency surgical work was done at the emergency hospital and one appendectomy was done in a home, typhoid immunization shots given, and on February 3 no typhoid had been reported. Constant supply of good water was available from deep wells at the distillery and from Greendale. Local organization of physicians functioned smoothly, doctors and nurses sent by Red Cross and National Guard were invaluable.

Many pages of similar accounts might be written, not only of the physicians of Indiana, but of all the states where Old Man River was busy with his deviltry, and we may extend to them the salute given by Dr. Edmund D. Clark, President of the Indiana State Medical Society, at the close of a brief tribute.

"Doctors of southern Indiana, the State and the Nation are proud of you!"

DO YOU KNOW?

Animals that have been electrocuted can be saved by countershocks administered within four minutes, according to research by Prof. William T. McNiff and Dr. Leonard J. Piccoli of Fordham University.

Quality of meat can be recognized by its appearance, odor and texture. Good meat is firm and elastic to the touch, moist but not wet, and is red in color. It has a fresh, agreeable odor. The fat should contain no watery juices or jelly, and should be free from blood stains. Suet fat should be firm and white. Meat under the slightest suspicion as to its quality should never be used.

Says Dr. Richard C. Leonard, of the Maryland State Department of Health: "The teeth are built largely of mineral salts, notably those which contain calcium and phosphorus. The necessary tooth-building materials and the vitamins that are required for the maintenance of strong, healthy teeth are found in certain foods. Experience has proved that cow's milk, dairy products, eggs, green leafy vegetables, whole grain cereals,

and fresh fruit juices, especially of oranges and other citrus fruits and tomatoes, are the best sources of the construction elements necessary to the promotion of sound teeth and the maintenance of mouth health."

Ray Lyman Wilbur said: "The quality of medical care is an index of a civilization."

The habit of kissing a bruise or other hurt to make it well arose from the worldwide custom of sucking wounds to further their healing.

Persons who go from the northern clime to the tropics should avoid alcohol, eat simple food, get plenty of sleep and drink a great deal of water. Two years is the longest period northern people can live in the tropics without deterioration of health.

Baked beans, popularly thought of as the main diet of muscular men of the woods, contain a minimum of muscle-building proteins.

—*Excerpts from a press bulletin issued by the Bureau of Public Relations of the Medical Society of the State of New York*

Books

Books for review should be sent directly to the Book Review Department at 1313 Bedford Avenue, Brooklyn N. Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

The Intimate Side of a Woman's Life By Leona W. Chalmers. Octavo of 128 pages, illustrated. New York, Pioneer Publications, Inc., 1937. Cloth, \$1.50.

This, another sex book for the public, is unique in that it advances the idea that vaginal discharge is the source of nearly all the ills to which a woman is subject. The author calls it "the thief of womanly charm," and advocates plenty of douching which should be carried out by means of a spray which has been developed as scientific douching equipment for "unclean, unlovely wives." Pictures of it are shown, but the manufacturer's name is not mentioned. Presumably it may be bought in any drug store.

CHARLES A. GORDON

Symptoms and Signs in Clinical Medicine. An Introduction to Medical Diagnosis By E. Noble Chamberlain, M.D. Octavo of 424 pages, illustrated. Baltimore: William Wood & Company, 1936. Cloth, \$8.00.

This will be of special help to students who, having mastered their theoretical knowledge of medicine, are yet confused by the similarity of signs and symptoms existing in various diseases. With the assistance of this book they will be able to coordinate their knowledge better, and to apply it in a practical manner in approaching the proper diagnosis, and hence the proper treatment.

The outstanding feature of the book is the way in which the author has described each symptom and has then proceeded to enumerate the conditions wherein these symptoms occur. The technique of eliciting symptoms is explained, the institution of special investigation described, and useful instrumentation illustrated. Dr. Chamberlain has thoughtfully provided numerous tables and the book is amply illustrated, containing 282 plates, 17 of which are in color.

It seems that in a work of this wide scope the author might have briefly outlined his preferred course of treatment. However, this is the only adverse criticism to be made of an otherwise excellent volume.

WILLIAM LINTZ

Cystoscopy and Urography By Jas. B. Macalpine, F.R.C.S. Second edition. Octavo of 478 pages, illustrated. Baltimore, William Wood & Company, 1936. Cloth, \$9.00.

This is the second edition of an excellent work published in 1927.

It covers the entire field of diagnostic and therapeutic cystoscopy in a comprehensive manner. An especially fine quality of paper is used. This adds materially to the clearness of the illustrations, which are numerous and excellent, particularly the colored plates, which show beautifully a number of cystoscopic pictures frequently noted in actual practice.

We are sure that a copy of this book should and will find its way into the library of every student and practitioner of urology.

N. P. RATHBUN

Toxicology or the Effects of Poisons By Frank P. Underhill, Ph.D. Thoroughly revised by Theodore Koppanyi, Ph.D. Third edition. Octavo of 325 pages. Philadelphia, P. Blakiston's Son & Co., 1936. Cloth, \$2.50.

Underhill's *Toxicology* has been thoroughly revised by Theodore Koppanyi, Professor of Pharmacology and Materia Medica at Georgetown University School of Medicine.

A number of substances of toxicologic importance not included in previous editions have been added, chief among which are avertin, cinchophen, dinitrophenol, ephedrine, mercurial diuretics, newer barbituric acid derivatives, quinine and its substitutes, and thyroid.

Only essential facts of clinical importance are given; no attempt is made to enter into details of chemical reactions involved in the isolation and identification of poisons. Doctors Underhill and Koppanyi have displayed the unusual faculty of condensing their information in a very short space. The description of most drugs is adequately covered in one or two pages. A brief bibliography follows the presentation of each drug.

This book is highly recommended and should be in possession of every physician.

ORDERING BOOKS

As a service exclusive to our readers, books published in this country may be ordered through the Business and Editorial Offices of the Journal (33 W. 42nd St., N. Y. C.) postage prepaid. Order must be accompanied by remittance covering published price.

who prescribes drugs. It is a mine of information especially adapted to needs of the general practitioner and, indeed, might well be used as a standard text in our medical schools.

The practicing physician is interested chiefly in treatment, and since the treatment of drug poisoning is included, the reviewer suggests that in subsequent printings the title of the book be changed from "*Toxicology, or The Effects of Poisons*" to "*Toxicology or the Effects of Poisons and Their Treatment*"

CHARLES SOLOMON

Urology By Edward L. Keyes, F.A.C.S. & Russell S. Ferguson, M.D. Sixth edition. Quarto of 707 pages, illustrated. New York, D. Appleton-Century Company, 1936. Cloth, \$10.00.

In 1874 the Senior Keyes and Van Buren wrote a book on Surgical Diseases of the Genito-Urinary Organs. In 1888 Van Buren had passed on, and the Senior Keyes wrote a revision of the 1874 Book.

In 1903 we see an edition of the Book published by the Senior Keyes and associated with him his son E. L. Keyes Jr., who is the Senior author of this present sixth Edition of Urology.

In 1917 the Urology appears with the name of E. L. Keyes alone, the father having passed on. Subsequent editions of this appeared and now we have this one with a Junior Urologist associated with the Keyes who was the Junior Author in the 1903 edition. It is this continuity of experience that helps to make this book one of such great value to the clinician.

It is a far cry from the '74 edition which states that "gonorrhea is a local disease, that cancer is rarely seen in the bladder and that in desperate cases one might even open the bladder suprapubically to give relief," to the 1936 volume which speaks of gonorrhea as a systemic disease and discusses the treatment of the common bladder cancer by means of radium implantations through suprapubic or cystoscopic approach.

This present edition by reason of its beautiful English, its precise technical descriptions, and its mellow wisdom, not only that of a great urologist but of a wise and humane physician, is for this reviewer, the perfect flowering of all the editions since 1874.

Most of the illustrations are in black and white and are quite satisfactory. The drawings of Miss Freret are fine. These with the compact text and the arrangement of contents by one who has been a great teacher all his life, make the book one of especial value for medical students. We prophesy that many medical schools will

make it their standard textbook and that all will place it on their required reading list.

STURDIVANT READ

A Preface to Nervous Disease By Stanley Cobb, M.D. Octavo of 173 pages, illustrated. Baltimore, William Wood & Company, 1936. Cloth, \$2.50.

This brief manual is intended as an introduction to the study of nervous diseases. As a matter of fact it does not treat of nervous diseases but is in the main a summary of anatomical and physiologico-pathological considerations in health and disease of the nervous system. The author devotes a chapter to the subject of consciousness and the "mind-body" problem. Consciousness, we are told, is an integrative process. This integration can take place at any level of the cerebro-spinal axis. Consciousness is awareness and may be present in the lowest forms of vertebrates, and even in plants. Does not the sunflower turn toward the sun as if aware of the source of light? It is our humble opinion that no one will be benefited by adopting such conception of consciousness. Freud's postulate of the unconscious as a storehouse of repressed experiences, with unpleasant content and intolerable situations, is not mentioned. This book can be read with interest by all students of neurology.

JOSEPH SMITH

Oral Diagnosis and Treatment Planning A Textbook for Students and Practitioners of Dentistry and Medicine. By Samuel C. Miller, D.D.S. Octavo of 620 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., Inc., 1936. Cloth, \$7.50.

This book is one of the new type, dealing with oral diagnosis and treatment planning, and should be in the possession of all those practicing dentistry or any of its branches. Beginning with a chapter on The Science of Oral Diagnosis, it follows through with chapters on Pain of Dental Origin, Dental and Periodontal Diseases in Children, Diseases of the Oral Mucous Membranes Exclusive of the Neoplasms, Radiographic Interpretation, Diagnosis of Surgical Conditions, Caries, Its Detection and Diagnosis, Diagnosis for Bridgework and Bridge Design, Diagnosis in Orthodontia, Mouth Infections and Their Relation to Systemic Disease, and ends with a chapter on Salivary analysis. It is exceedingly well edited and makes a great effort to systematize oral examination. Contributions of great value, by men well versed in their subject, have been included. It is well illustrated and can be considered one of the finest works of its kind as yet published.

LAWRENCE J. DUNN

IODIZED OIL TECHNIC IN PTERYGIUM CASES

T J DIMITRY, M D, New Orleans, La

*Professor of Ophthalmology and Director of the Department, Louisiana State University,
Professor of Special Anatomy Loyola University*

The distention produced by the injection of iodized oil and the therapeutic effect are of value in solving the pterygium problem, for the first establishes it as a loose tissue growth, and the second that it is a type of tissue which can be made compact by the action of the oil.

The pterygium when injected with oil is in consequence made to balloon, and if iodized oil* is used for the purpose it will act upon this distensible tissue and flatten it.

If the oil is injected to the side or against the sclera under the growth, the pterygium will not enlarge, for the oil so placed will spread, and to have the ballooning, it must be into the pterygium stroma where it is restricted. Therefore the pterygium is a restricted loose tissue growth in the conjunctiva.

These observations may be added to by demonstrating the attained effect when the growth is grasped and almost encircled by forceps and moving it about on the globe, showing that it does not make attachment to the sclera.

The same loose tissue nature exists in the head of the pterygium, however both the head and the body are under a comparatively healthy epithelial covering. The head as it progresses into the cornea remains always under this covering, and

as the growth advances, destroys the homogeneous membrane of Bowman. It is as it was, a loose tissue mass that balloons, and when grasped with forceps made to advance into the cornea.

Such a fibrillated tissue—both body and head—makes up the pterygium and offers no resistance to the flow of the iodized oil, for the oil can be made to insinuate itself into this loose fabrication and to excite a mild inflammation of the lymphoid type. The growth becomes dotted with the oil and macrophic cells increase greatly.

The attributes of the oil show that it will permeate into and excite an inflammation in the loose tissue which is most desirable for this type of pathology. This action topples the loose tissue and makes flat an otherwise distensible tissue.

To prove that the action of the oil was as stated, the author by physical means obtained the same razing after inserting a probe into the pterygium stroma. He broke up the loose fabrication and it became levelled, the same effect as attained from the action of the oil. In consequence of such effects, one physical and the other chemical, both flattening the loose tissue, he made the deduction that the transplantation operation on the pterygium accomplishes its excellent results by the undermining and the breaking up of the tissue, and not by the change in its

* Lipiodol (Lafay) was used in this study.

Fig 1 The pterygium is injected with iodized oil

Fig 2 The distention is proof of a loose tissue and makes it possible to sever the head from the body

Fig 3 The head can then be pulled by forceps from the cornea.

Fig 4 No suturing is necessary Excess oil is expressed

course. Whatever procedure is adopted for the flattening of the growth, the head should always be removed. Not that the iodized oil might not accomplish the head's flattening in time, yet it is more gratifying not to have to wait.

Iodized oil is nonirritating when instilled into the eye, it is also nonirritating when injected into the conjunctiva. However, to be able to insert the needle that carries the oil, the conjunctiva should be anesthetized. The iodized oil—although a product of an iodine activity or the unsaturated fatty acids—is an agent that is neither iodine nor a fatty acid. It is not caustic as the halogens are, nor as irritating as olive oil. It is bland and one is inclined to believe that it has an analgesic property. This viscid substance is usually warmed before being injected, so that it may flow more readily through the needle. The amount required to distend the pterygium is small. Once having accomplished the infiltration, a skiagraph may be obtained.

The skiagraphs (Fig 1-4) reveal that the oil spreads throughout the growth and becomes limited by the side walls and at the nasal end by the third lid. There are no opaque lines extending from the growth in any direction that would indicate channels.

Modus Operandi

An injection is made of iodized oil starting at about three millimeters in and three millimeters away from the corneoscleral margin. The injection of the iodized oil will produce a ballooning of the pterygium from the head down to its base, as shown in Fig 1. This clearly shows the pterygium in its full outline and with elevation as before mentioned.

A Wheeler knife is then introduced beneath the pterygium about three millimeters from the corneoscleral margin, cutting same in a see-saw movement from behind forward, as in Fig 2, thus severing the head from the body of the pterygium.

With a fixation forcep, the head can now be pulled or stripped from the cornea, from the limbus to the apex. If some fibers or tissue remain, it is well to curette the entire surface occupied by the head as in Fig 3.

The author has on different occasions permitted the head to remain undisturbed other than to make certain that the oil had infiltrated into its loose tissue to determine if it would flatten by the oil's action, and if delicate corneal tissue would suffer. It does not irritate the corneal tissue and the head flattens, although very slowly.

When the head of the pterygium is severed at the neck, little or no bleeding occurs and the distention offers assistance in permitting the extraction from the cornea. Only the epithelial covering offers resistance to the pulling and there is left a surface which is quite smooth. A knife should not be used, the desire being to leave the stroma of the cornea undisturbed preventing thereby a macula cornea.

After the neck has been severed and the head torn from the cornea, there is left purposely and without any desire to transplant the body or close the wound, the opening into the pterygium's body. Oil can be seen oozing from the opening and is to be encouraged by pressure upon the distended growth, for such procedure removes excess oil. There is a disadvantage in leaving excess oil remain, for it is slow to be absorbed and may even become fixed for a long period of time in the tissue.

The bandage is then applied and after a few days, is removed, the corneal wound is observed to be covered with epithelium and the body flattened.

It is not quite certain to the author that a particular iodized oil is required though he is partial to lipiodol. The objection to the iodized oil is the protracted period that is sometimes required for its absorption. This is easily overcome if excess oil is pressed from the growth. However, there can be no harm if it remains for it is ultimately to become absorbed. It is to be seen that breaking up and rubbing will hasten its absorption.

When adopting the use of the oil, it is more economical to make purchase in small ampule packages for there is greater certainty of the purity and that oxidation of its fatty acids have not come about. Fig 1-4 reveal the surgical procedure and the description of the plates readily carries the story.

SERUM THERAPY FOR PNEUMOCOCCUS TYPE I PNEUMONIA

JESSE G M BULLOWA, M.D, *New York City* and MURRAY J HANIGSBURG,
M.D, *Brooklyn*

If only the patients suffering from pneumonia due to pneumococcus Type I were treated with specific serum, there would be a very definite saving of illness and of lives. Despite convincing statistics and dramatic experiences demonstrating the efficacy of specific antipneumococcus serum therapy, many physicians still hesitate to employ it. The reasons for this attitude may be

- 1 The belief that determination of the type of pneumococcus responsible for the pneumonia is a complicated procedure and requires the aid of a very experienced bacteriologist.

- 2 The costliness of serum

- 3 The supposed great hazard of intravenous therapy

- 4 General ignorance of the details of administration of the serum

We wish to present concisely the method of serum treatment employed at Harlem Hospital and correct misunderstandings concerning serotherapy in pneumonia.

Pneumococcus typing and the determination of agglutinins in the blood may be performed without elaborate equipment. As demonstrated at the Atlantic City Convention of the A M A, and at the recent Graduate Fortnight of the New York Academy of Medicine the Neufeld swelling reaction and the test for the determination of the agglutinins may become office procedures performed as simply and as rapidly as a white blood cell count. For the efficient use of serum in pneumonia, these two laboratory procedures are required, one for prompt typing, the other for control of serum dosage

1 Neufeld swelling reaction for Pneumococcus Type I A tiny fleck of sputum is mixed on a glass slide with undiluted

These studies receive support in part from the Metropolitan Life Insurance Company and the Maurice Levin Fund.

From the Littauer Pneumonia Research Fund New York University College of Medicine and the Medical Service, Harlem Hospital (Department of Hospitals)

Pn I rabbit serum containing standard methylene blue solution (The dye stained rabbit serum is supplied in a convenient capillary tube) When the reaction is positive, there is visible under the oil immersion lens, swelling and a definite outline of the capsule. In pneumococci showing a negative reaction, the capsule will appear as a narrow halo without definite outline. The reaction is so specific that the diagnosis of the type may be made if a single swollen capsule is seen. A positive reaction usually occurs within a few minutes, though sometimes it may require twenty to thirty minutes to appear.

The great source of error is the use of too much sputum and too little typing serum. Seventy-five per cent of the cases which can be typed from the sputum may be typed directly by the Neufeld reaction.

2 Determination of agglutinins for pneumococcus Type I (as a marker for excess antibody in the patient's blood)

- (a) Prick patient's finger as for a blood count, and collect blood in a capillary tube, two and one half inches long

- (b) Permit blood to clot, to separate serum (this may require twenty minutes)

- (c) Mix a drop of the patient's serum with a drop of pure formalized suspension of pneumococci Type I (the latter may be purchased in capillary tubes for individual tests)

- (d) The formalized organisms of a different type are mixed with a drop of serum on the same slide as a control

- (e) Air dry the slide

- (f) Pass through dehemoglobinizing solution to dissolve any red blood cells present. (water, 94 c.c. glacial acetic acid, 1 c.c. formaldehyde, forty per cent, 5 c.c.)

- (g) Then stain for one minute with alkaline methylene blue or diluted carbol fuchsin

- (h) Blot and observe under oil immersion lens

The degree of agglutination is indicated as follows (See accompanying figure)

+ Strong agglutination (all organisms tightly clumped)

± Moderately strong agglutination (most organisms clumped but in loose aggregates)

≡ Slight agglutination (most organisms unclumped)

— No agglutination

The presence of agglutination is evidence of protective antibodies in the blood. If there is strong agglutination, ample protective antibodies have been supplied, and additional serum is useless.

An hour's practice may be sufficient for the acquisition of skill. Typing of sputum may be done by private hospitals or in state or municipal laboratories. For the agglutination tests, the capillaries of blood laboratory strapped to a wooden tongue blade.

Expense of Serum

The cost of serum depends on the amount of capsular substance to be neutralized and the number of organisms to be sensitized. The earlier treatment is instituted the less serum is required. There is no advantage in leisurely administration.

The primary mortality from pneumonia is far greater than from appendicitis. The complications are more frequent and severe. Hospitals do not deny patients surgical intervention because of expense. When administered early, the cost of serum is not greater than the usual cost of the operating room. Complications are more frequent without serum. Because the cost of surgical care may be averted if patients are treated on the first and second day, the treatment of pneumonia due to pneumococcus Type I without serum, is only an apparent economy. The value of the saved human lives in money may be computed with the help of Dublin's* "Money Value of a Man." The public hospital saves in overhead, nursing care, and oxygen. The individual is returned to work sooner at less expense.

New York City, through its Department of Health, New York State, the State of Massachusetts, the State of Connecticut, and the State of Maine

furnish serum without cost to those unable to purchase it.

Hazards of Intravenous Therapy

Serum reactions may be classified as (1) Immediate—which present themselves during the injection or within one half hour. They include dyspnea, cyanosis, low lumbar back pain, urticaria, restlessness, and severe coughing. These symptoms are usually controlled promptly by epinephrine, 0.5 cc.

(2) Chill reactions are less frequent with refined and concentrated serum, when they occur they may be shortened by inhalations of amyl nitrite. (3) Late (serum sickness) usually occurs from three to eight days after the first dose of serum. These include joint pains, itching, urticaria, fever, and generalized enlargement of lymph nodes.

Sudden anaphylactic death following the initial dose of serum (in patients with negative skin and ophthalmic serum tests) is extremely infrequent. Deaths attributed to serum following serum injections in the course of treatment are rare and occur in severely ill patients with overwhelming bacteremia. *A syringe containing epinephrine should always be on hand when serum is administered.*

Serum should never be administered without intradermal skin and conjunctival tests*. If in the course of the serum therapy there has been a lapse of three days or more in the administration of serum, the sensitivity tests should be repeated. Slightly positive skin tests without pseudopodia do not necessitate withholding serum. Positive reactions (large wheal with pseudods) require either (1) the use of rabbit serum if available and the patient is insensitive to it and (2) production of antianaphylaxis by administering epinephrine ten minims and a dose of $\frac{1}{4}$ cc of serum slowly and very well diluted eight to ten minutes later. Afterwards subsequent doses should be given in great dilution and very slowly, preceded by epinephrine.

The incidence of serum sickness with refined serum was thirteen per cent in our Type I cases. These reactions, for the most part, have not been severe and

*By Louis H. Dublin and Alfred J. Lotka, New York: Ronald Press, 1930.

*This refers to horse serum administration. A blood pressure test is used for rabbit serum.

are easily controlled. Skin manifestations—e.g., wheals and itching—are adequately relieved by subcutaneous injections of epinephrine hydrochloride gm 0.5 to 1, and headaches are relieved by acetylsalicylic acid grains V-X q three to four hours, for twenty-four hours.

Administration of Serum— Dosage and Frequency

Insufficient serum given at infrequent intervals is the chief cause of failure in the use of antipneumococcus serum.

Because of this many physicians have not achieved results comparable to those seen in Type I pneumonias treated with serum, in the large pneumonia clinics.

Different lots of serum may contain from 1,000 to 4,000 units of antibody for Type I per c.c. When administering a less concentrated serum the doses should be larger or more frequently given. We rarely employ more than forty c.c. of serum at one dose. Serum should be given slowly, no faster than one c.c. per minute.

Control of Serum Dosage

Indications for stopping Serum

1 Sustained

Decrease of pulse rate — less than 90 per m. n.
 Reduction of temperature — fall below 100 F.

Time	Co. test
1 hr.	1 hr.

2 Agglutinins

(Absent in blood before first dose — present immediately afterwards)
After re-injection of (1) 3 hours after last dose and later.
Finger blood collected in capillary, mixed with homologous formalized bacterial emulsion (five 100 million organisms a fluid with formaldehyde 1%).
When bactericidal serum is given the mixing of agglutinin drops and more serum is needed like the standard emulsion, there being no reaction for pathogen agglutination and excretion and destruction of fellow.

No agglutination on
Allergens disc test

Most organisms clumped

Tight agglutination

3 Francis test (confirmatory) Inject specific soluble substance (1:1000) Emulsion: saline or lyophilized fraction

Saline

Francis +

Test Saline — with SSS + flare 20
Control Saline — without SSS = no flare
Size of reaction test is in sq. cm. usually not accompanied by any reaction with 1

Persistent rapid pulse or elevated temperature indicate

1 Continued infection Give additional serum

2 Complications may prevent appearance of agglutination Remove fluid from pleura pericardium or elsewhere

3 Incorrect type

a Laboratory or bedside error
b type from head discharge not from sputum
c Patient a carrier of type recovered all with different and traditional organisms

If suspected from failure of therapy Repeat

1. Sputum by direct specimen directly collected
2. Lung swabs
3. Blood culture

4 Serum sickness Elevated temperature and accelerated pulse may be side symptoms or with vague or transient evidence in skin joints or nodes. Skin becomes sensitive to horse serum (dilute on 1:10)

5 Invasion by additional type of pneumococcus or other organisms

Retype and do type exclusion test (Griffith)

The usual errors in therapy are (1) Size of the total and individual doses—We have found that the average early (1–3 days) non-bacteremic Type I case responds to a total of from 125,000 to 200,000 units of serum. A late case (3–6 days) may need 250,000 to 350,000 units. A bacteremic Type I case is given between 400,000 to 600,000 units of serum.

Except in the first two doses, the amount should be as large as possible, in order to terminate the case promptly. In bacteremic cases we frequently give forty c c at a dose. The unitage mentioned is that actually present. Trade packages may contain as much as fifty per cent more than is stated on the label. Manufacturers should state the unitage per c c. (2) Frequency of administration—Probably reasoning from their experience with meningococcus therapy, physicians frequently give ten to fifteen c c of serum at six to twelve hour intervals to acutely ill pneumonias. This accounts for their poor results. Recently we have been giving serum at two to three hour intervals, with excellent results.

A typical serum treated case due to *Pneumococcus* Type I pneumonia is managed as follows:

Immediately following the clinical diagnosis, the sputum is collected, and a blood culture is taken. If pneumococcus Type I is found by the Neufeld reaction, an intracutaneous skin and an ophthalmic test for sensitivity are performed. If negative after twenty minutes, the first dose of five c c of the serum is given intravenously but not more rapidly than at the rate of one c c per minute. During this time, the respiration is carefully watched and if there is dyspnea, marked weakness or complaint of sudden low lumbar pain, the needle is immediately withdrawn and five c c of epinephrine 1:1000 solution is given subcutaneously. If the first dose of serum causes no reaction, it is probable that subsequent doses will be well-tolerated.

An hour later a second dose is administered usually about fifteen c c. The following doses of serum from twenty to thirty c c in amount are then given at two to three hour intervals, depending on the size of the dose, the frequency of the injection, and the unitage of the serum. A total of 125,000–200,000 units can easily be given in a period of six to ten hours.

Five hours after the last dose of serum, the agglutinins in the blood are determined.

If negative, there may be either a bacteremia, a very virulent pneumococcus infection or a complication. The first two require additional serum. By this time the blood culture may have given information concerning bacteremia.

If, eight to twelve hours following the last dose of serum, the temperature drops to 100°F, and the pulse has not fallen, the serum should be continued unless there is plus agglutination. In that case serum is useless and another explanation for the temperature and pulse must be sought.

The first clinical indication of the patient's improvement is frequently subjective, usually there is the lowering of the pulse followed three to four hours later by a drop in the temperature, and still later a decrease in the respiratory rate. Even though the patient's pulse and temperature are high, if the agglutinins are plus or minus, serum is withheld and the patient is watched for the next eight to twelve hours for clinical improvement. If the agglutination becomes minus-plus, more serum is given. The test should be repeated at two to four hour intervals after the last agglutination determination, unless the temperature remains low.

Serum in Late Cases

The impression exists among physicians that Type I serum is of little value in late cases of pneumonia. (Cases due to pneumococcus Type I, after 4 days or later). This is not true. We have found that these cases may be terminated with serum and that the mortality is decreased. They frequently require more than 200,000 units of serum.

Bacteremia may appear early in the disease, though frequently it is not present until the third or fourth day. Bacteremias and complications may be prevented by sufficient serum given early in the disease.

Pneumonias of different etiology are distinct diseases, with distinctive habits and course. Nostrum vendors seek to perpetuate the outworn view that "pneumonia" is a complete and final diagnosis and urge physicians to use so-called general immunity stimulating substances (vaccines and immunogens and quinine derivatives). Those who have had the most experience know that these substances have no beneficial effect on the severe blood invaded cases, and that the others usually recover uninfluenced by

such treatment The effect of the newer para-aminosulphonamide dyes has not yet been evaluated in the pneumococcic pneumonias

The serum treatment of the pneumococcic pneumonias depends upon careful differentiation of the pneumococcus types Each serum has effect on its own type of pneumococcus and on no other No serum is potent against pneumococci

as a group Serums valent against two or three types of pneumococci have been manufactured but they are potent only against the types for which they have been prepared It is desirable to use sera of high unitage and those which do not produce chill reactions in patients

MEDICAL RADIO BROADCASTS

The following broadcasts have been scheduled by the New York Tuberculosis and Health Assn under the auspices of the Medical Information Bureau of the New York Academy of Medicine

Saturday, April 17, 8 30 P.M., Station WNEW—*Speaker* Mr Frank Kiernan Director, New York Tuberculosis & Health Association *Subject* "The Goal is in Sight"

Tuesday, April 20, 1 00 P.M. Station WOR and network of the Mutual Broadcasting Co.—*Speaker* Dr Israel Weinstein, Assistant Director, Bureau of Health Education, New York City Department of Health *Subject* "Is Your Child Safe?"

Tuesday, April 20, 4 00 P.M. Station WNYC—*Speaker* Dr Abraham E. Jaffin, Chief of Hudson County Tuberculosis Clinics *Subject* "Advances in Treatment of Tuberculosis"

Tuesday, April 20, 2 30 P.M., Station WHN—*Speaker* Mr Bernard S. Coleman, Secretary, Tuberculosis Committee, New York Tuberculosis & Health Association *Subject* "Fashions in Tuberculosis Control"

Thursday, April 22, 4 30 P.M., Station WJZ and blue network of National Broadcasting Co.,—*Speaker* Dr Kendall Emerson, Managing Director of National Tuberculosis Association *Subject* "How Long Will It Take?"

Friday, April 23, 11 00 A.M., Station WNYC—*Speaker* Dr Peyton F. Anderson, Attending Physician, Sea View Hospital *Subject* "Modern Methods in Treating Tuberculosis"

Saturday, April 24, 8 30 P.M. Station WNEW—*Speaker* Dr William J. Ryan, Medical Director, Summit Park Sanatorium, Pomona, New York *Subject* "Modern Treatment of Tuberculosis"

Tuesday, April 27, 1 00 P.M. Station WOR and network of the Mutual Broadcasting Co.—*Speaker* Dr Foster Murray, Director of Tuberculosis Service, Kingston Avenue Hospital, Brooklyn *Subject* "Pulmonary Tuberculosis—Important Diagnostic Points"

Tuesday, April 27, 4 00 P.M., Station WNYC—*Speaker* Dr Maurice Kovnat, Physician in Charge, Richmond Tuberculosis Clinic, St George, Staten Island *Subject* "Heed the Tired Signals in Tuberculosis"

Tuesday, April 27, 2 30 P.M., Station WHN—*Speaker* Miss Amelia Grant, Director, Bureau of Nursing New York City Department of Health *Subject* "The Child in a Tuberculosis Family"

Friday, April 30, 11 00 P.M., Station WNYC—*Speaker* Miss Mabel E. Grover, Supervisor, Henry Office, Henry Street Visiting Nurse Service *Subject* "The Public Health Nurse in a Tuberculosis Program"

EDITORIALS

American Medicine—"Expert Testimony Out of Court"

The American Foundation Studies in Government published on April 4 its report of its medical inquiry. We have previously commented on the character of this report. We stressed the fact that the Foundation had no preconceived idea or scheme to bolster up for which it collected the data and opinions which constitute the report. No idea contained in this report is the handiwork of any layman, except the putting together, the classification of the information, and the necessary editorship to accomplish these ends.

The report actually has been written by the profession itself. It is not written by the officially organized profession. No vote was taken on the views expressed. No one argued with anyone else and evolved an opinion which represented compromise in judgments. Many who hold official position in organized medicine gave their own personal, individual views. Likewise both general practitioner and specialist find full representation. The cross-section of professional opinions show evidence of coming from all sections of medicine—from medical teachers, deans of medical schools, laboratory and research workers, group practitioners, hospital administra-

tors as well as public health officials. Over 270 contributors are presented which came from the State of New York alone, to say nothing of the thousands from the rest of the country. The list of New York contributors will be found on page 831 of this JOURNAL. In other words, this is the first, and as far as we know, the only report written by the profession on pending medical questions which deeply concern not only the profession itself, but also the public.

Somewhat near 5,000 letters have been classified, analyzed, and their ideas correlated and presented—a very fair "sampling" of the predominant medical opinion of the country. The report is sponsored by 134 medical men associated in a Medical Advisory Committee who joined with the American Foundation in presenting the report to the public. The men who constitute the Medical Advisory Committee assume no responsibility either individually or collectively for any of the ideas quoted or presented. The Advisory Committee, on the other hand, does endorse the report as a fair summary of the views of those of their colleagues who replied to the Foundation's inquiry. They endorse the integrity of the work, and commend the

report to the study and consideration of medical men generally and the public particularly

Among the Medical Advisory Committee are the following New York men: Louis Casamajor, Russell L. Cecil, Walter T. Dannreuther, Cary Eggleston, Smith Ely Jelliffe, Samuel J. Kopetzky, William S. McCann, James H. Wyckoff, James A. Miller, Walter L. Niles, and Nathan B. Van Etten. The list of contributors reads like a medical "Who's Who."

We welcome the report and bespeak for it a considered judgment by organized medicine.

Dangerous Privilege

The Feld-Milmoe bill extends the privileges of osteopaths beyond the demands of osteopathic theory or the qualifications of osteopathic training. If the distinctions between medicine and osteopathy are to be broken down by an extension of osteopathic prerogatives, there should be a frank acknowledgment of the therapeutic limitations of osteopathy.

The osteopath, no more than any one else, can expect to have his cake and eat it. If osteopathy contains within itself the fundamental principle of healing, as its disciples claim, they should be satisfied with their system and not seek to employ alien methods. If, on the other hand, they acknowledge the superiority of medical catholicism, they should forswear narrow sectarianism and take the regular medical course.

There is an intellectual dishonesty about the whole method of the Feld-Milmoe bill. Its proponents defend it on the ground that osteopathic schools now approximate the medical course and their graduates will be required to take the same examination as physicians. They neglect to state that in order to qualify for the state board examinations physicians, unlike osteopaths, must have studied pharmacology and materia medica.

After graduation, moreover, the physi-

cian usually serves an internship, where he learns to perform surgery and employ drugs under strict supervision. What similar protection against inexperience do the osteopaths offer the public to justify their demands? Where can they acquire practical experience in the numerous surgical procedures, the delicate therapeutic technics, the Feld-Milmoe bill would permit them?

Suppose the osteopathic schools have stiffened their courses and future candidates for osteopathic license will have to pass the same examinations as physicians! Fully fifty per cent of the osteopaths in practice today were graduated from schools which referred to drugs only to deprecate them and which disputed the necessity or desirability of surgery. This fifty per cent, with no further preparation, without any pretense of adequate training, would be authorized by the Feld-Milmoe bill to perform a wide range of surgical operations, to employ powerful drugs, and to administer anesthetics that are highly dangerous in inexperienced hands.

In no field is unearned power more hazardous than healing. The prerogatives conferred on osteopaths by the Feld-Milmoe bill offer a serious threat to the public health by placing potentially dangerous instruments in the hands of a group unqualified by training or experience to use them safely.

Help Save the Lien Bill

The attack launched on the physicians' and nurses' lien bill by various bar associations shows more regard for technicalities than for justice. Not one of the hostile resolutions has been successful in impugning the purpose of the Kleinfeld-Fite Act or the fairness of its basic provision.

Under existing laws the physician who aids accident victims has little chance of recovering the value of his services. During the emergent period, financial questions remain in the background. Once the emergency has passed, it fre-

quently develops that the patient is unable or unwilling to pay for the care he has received

When an award is made in accident cases, the intent is to repay the victim for the medical expense he has sustained, among other damages. There is however nothing to enforce this purpose. All too often the recipient considers the grant a sort of bonus, to be used for his own enjoyment or profit without regard for the moral claims upon it. By the time a physician or nurse secures legal affirmation of his rights, the money may be spent or transferred to a third party, to prevent execution of the judgment.

A lien bill enacted last year protects the hospital in such cases. The Kleinfeld-Fite Act extends this protection to the physicians and nurses of the state, who are equally entitled to it.

All of the technicalities on which the bar associations base their opposition can be obviated by the correction of loose phraseology or the addition of clarifying provisions. None of them is important enough to warrant rejection of a basically sound bill. The physicians and nurses of the state are entitled to this safeguard and are in need of it. Let them make themselves heard in defense of a measure which guarantees them at least a measure of justice.

American Foundation Report

To any one who reads the voluminous report of the American Foundation on its medical inquiry, it becomes apparent at once that the solutions for the problems inherent in the easy availability and delivery of medical care to the American people, as well as the sustained maintenance of high general health standards (which of course must include extension of preventive medicine) cannot be obtained by any easily devised short-cuts.

It is also evident that organized medicine must revise a few of its hitherto strongly held conceptions. A clearer comprehension of the implications of the

doctor-patient relationship seems in order. The integration of the general practitioner with preventive palliatives seems warranted. The concept "that adequate medical care is, and always has been available to all the American people" needs further study and elucidation. Is it not true that we, as physicians have too little personal contact with the "medically indigent" because we usually are not wont to meet them individually as our patients, but rather meet them as a class-group in our clinics and wards, because financial barriers hinder them from reaching us personally? Does doctor-patient relationship come before, or only after we meet them in our wards and clinics? They too need and want the factors in medicine which we as individual physicians could give them, to handle an incipient illness and prevent its progression toward serious consequences. It is in just such instances, that the availability of adequate medical care is hampered and hindered by financial barriers, and perhaps this is gradually becoming more important than the actual restoration to health of those who are sick. Here then, is another problem—how to provide high quality, easily available medical care to the medically indigent. But why stress details now?

Elsewhere in this issue will be found (page 821) an abstract of the report. From the mass of evidence presented, there emerges an emphasis, as it were, *on ten outstanding principles*. To read these ten principles and comprehend their significant import is to sense the high quality of the contribution made by this report. We believe that it will evoke much discussion and provoke medical thought and perhaps action to the end that a start at least will be made toward solving some of the complexing questions of the instant problems.

We, of organized medicine, are now faced with an obligation to the profession as well as a duty to the public. We shall have to alter our general attitude. We cannot continue our hitherto "passive" position. We were fully justified to

remain either "passive" or "in opposition" when the *only solution* tendered us was one comprising *compulsory health insurance*. It must be apparent even to the casual reader of this report that the problem is much larger, has greater implications, and must reach elements and factors in our population not even touched upon by the most ambitious compulsory health insurance scheme ever devised. Compulsory health insurance only touches upon the economic barrier separating the lower wage-earning groups from medical aid. It does nothing for the actually indigent, nor does it encompass any solution to the medical problems inherent to the situation of the rural and farming communities. It is totally unconcerned with the *quality* of medical care, and the many facets of the general medical problems which the report illuminates are left entirely unapproached to say nothing of even making a crude attempt to solve them. The entire question of preventive medicine is not even envisaged in compulsory health insurance schemes.

As a unit of organized medicine there is another consideration to which we must give thought. This is the political implication of the present situation in Washington. Were we, unfortunately, to have compulsory health insurance foisted upon us at this time, while the other elements and factors of the larger and more widespread questions remain unprovided for, unanswered and unplanned for—this very much larger field—revealed by the report as demanding serious consideration—would remain for a long time uncorrected, without intelligent planning, and without even an honest effort at seeking solutions for its problems. This would happen because there would result a complete cessation of all further endeavors to meet the medical issues of larger and more significant import. *Compulsory health insurance must be stopped while we, the organized profession, take the necessary positive steps to meet squarely these greater issues.* We know that all further efforts aiming at health standards, and the delivery of a

high quality of medical care would cease because legislators, having enacted the health insurance laws with their inevitable tax burdens, would conceive that they had "done enough for health." Government instead of setting out to study and evolve solutions to the greater medical questions raised by this report, would be too busy and too concerned in establishing the necessary bureaucracy to make compulsory health insurance work, in the face of a recalcitrant medical profession only half-heartedly assisting to establish a scheme of delivering medical care which it knows beforehand will reduce its quality, and will actually sell the population a "gold brick" for the money paid in direct, indirect and hidden taxes. And what about the medical institutions which produce doctors—the laboratories, the wards, and the operating rooms—the workshops of the profession—their financial status rendered progressively more precarious because of the failure of private endowments and awards to support them, would find existence increasingly difficult. There is a very paramount issue therefore facing us now. We must perforce take a positive stand. The report of the American Foundation, spreads opinions before us on the many complexities of the problem. From the study of these opinions we must have proposals ready which must encompass the whole field now opened to our scrutiny. When we have further studied this report, let us formulate a proposal upon which government, the profession, and the enlightened public can unite.

As we study this report further it becomes evident that the health of the community, as a whole, is a more paramount issue of the state than it is a problem of physicians whose first concern is the individual. Organized medicine can determine standards, and decide qualifying conditions under which the best of medical care may be obtained. It naturally must be the concern of the State to see that this high quality of medical service is easily obtainable by the citizenry. We have consistently held that the indigent are

properly the charge and wards of the local communities. This report repeats this stress. We have contended that the medical care to these must necessarily be a charge against funds raised by taxes, and the physician treating these indigents be paid so that the doctor serving the indigents is not twice taxed while his lay neighbor pays only one tax for the same purpose.

Of the "medical indigent" we have already spoken above. They need education to teach them *how to reach the doctor* when financial barriers seem to bar the way. This too is a local community problem more than one confronting nationally organized medical units. The community must establish agencies to arrange the finances necessary to pay the charges incurred by the "medically indigent" to cover the physician's services and the hospital costs. Perhaps some variation of the so-called DeSanctis plan holds the answer to this problem. This entails the establishment of a locally supervised bureau to determine what these medically indigent shall pay toward the discharge of their obligation, and yet it seems to us, that the local community too must contribute toward the delivery of high quality medical care to this underprivileged class-group. The rate of fees which the physician shall charge, to make the best services available to this group is another problem facing organized medicine. In the cooperative era upon which we are entering, such planning is not only in proper order but urgently necessary.

Since taxation in the present era is depleting private philanthropy, state aid through Federal grants will soon become necessary if we are to maintain and sustain many existing fine medical institutions including hospitals and laboratories.

If we desire to meet the instant problem presented by the practitioners in rural and outlying areas, and in sparsely settled communities, laboratory and consultative services must be made available to the country general practitioner. Can

such laboratories and medical consultative service exist without governmental aid?

Finally, it is very evident that a large and more active evolutionary development of preventive medicine is impending. We would welcome this were we to see it worked out so that the private practitioner would actually become the health official who would deliver the palliatives which medical science has won for the benefit of better health for the community. In the evolution of this larger health program—a program which must envisage sanitation and hygiene and reduce health hazards in field, mine, factory, school, store, and home—it would seem almost axiomatic that there must be established a *Federal Department of Health*, under a competent physician, separate and apart from all other welfare agencies. This item is now pending in our national legislature.

Finally we conclude from our perusal of the report, as the problems are touched upon by our leading medical men, that the private practice of medicine shall continue, and that it is feasible, possible, and workable to integrate this private practice of medicine with the ideas and principles here but briefly sketched.

One Phase of Continence

The fate of the millions of spermatazoa which are produced in the testes of a continent male has been a matter for conjecture. Spontaneous ejaculation accounts for the release of some but the means whereby the seminal vesicles and the vas deferens guard against overstorage remained in the realm of theory.

Based upon studies made with lipiodol injected into the seminal vesicles by Wilhelm,¹ he and Selgmann² examined specimens of urine obtained from abstinent men and were able to demonstrate

¹ Wilhelm, S. F. Observations on the emptying of the vasa deferentia and seminal vesicles, *Jour. Urol.*, 34: 284, 1935.

² Idem. Spermatazoa in Urine, *Amer. Jour. Surg.*, 35: 572, 1937.

the presence of spermatazoa in approximately three-quarters of the specimens taken at frequent intervals. These findings were present independent of an ejaculation having taken place. It proves definitely Oslund's¹ belief that the seminiferous tract empties itself by means of a slow, constant flow into the urethra in addition to mass emission.

From these observations it would seem as if there is no appreciable amount of storage of spermatazoa in the genital tract and that continence *per se* does not lead to atrophic changes in the testes due to disuse.

The Conference on Fever Therapy

The use of induced fever as a therapeutic agent has made remarkable strides since Wagner-Jauregg first employed it in the treatment of general paralysis of the insane. At the First International Conference on Fever Therapy held recently in New York City in commemoration of his eightieth birthday, a galaxy of physicians, physicists, and physiologists famed the world over, presented data on all phases of fever therapy. Among the diseases benefited by artificial fever are rheumatic fever, arthritis, chorea, certain ophthalmological diseases, neurosyphilis, and gonorrheal infections. The results obtained in these conditions warrant further investigation into other fields and the Conference has furnished this stimulus.

It is a far cry from the earlier means of inducing fever by vaccines and malaria without accurate control, to the present exact method furnished by the short waves. In the development of this type of therapy, considerable credit must be given to the physicists who collaborated with the medical profession in the perfection of the mechanical devices utilized in its administration. The physician, however, was and is the only one capable of estimating its value, indicating its uses, and evaluating the effects.

Progress in Medicine through Photography in Rochester

We have repeatedly called attention to the unusual features which will mark the one hundred and thirty-first annual meeting of our State Society this year in Rochester. We cannot nevertheless forego adding another note calling attention to a program of events arranged by Dr. Leo Simpson. This will constitute a public forum on the "Progress of the Art and Science of Medicine through Photography" and will take place in the Eastman Theatre. It is a cooperative enterprise between the State Society, the University of Rochester, and the Eastman Kodak Company. Additionally the Eastman School of Music is contributing the services of Messrs. Leo Godowsky and Leopold Mannes, who are concert musicians of high merit and general recognition. Both these artists are also inventors of the Kodachrome process of color photography.

On the purely scientific side of this program there will be Dr. Arthur Bedell of Albany with color photography of the eye, Dr. Warren H. Lewis of the Carnegie Institute, who will show movie photography of cell growth, including also "stills" of various diseases such as leprosy, small-pox, and other skin irritations. Under the direction of the Strong Memorial Hospital, there will be shown a film called "Birth of Anesthesia." From the Department of Parasitology, Professor Oliver R. McCoy will give the life history of the Anopheles, a movie film, and Dr. James M. Flynn, Vice-Speaker of the State Society, will discuss normal and abnormal roentgenological findings.

Kodachrome pictures depicting the circulation of the blood, and a moving picture of the bacteria of the mouth, also moving pictures of types of pneumonia, sputum and the use of sera in pneumonia will be shown.

There is also to be shown a moving picture on milk pasteurization, and a sound-movie illustrating the heart-beat so that those in the audience will be en-

abled to hear what the doctor hears through his stethoscope

There are many to whom visualization leaves a deeper and sharper memory-picture than when hearing about it. To all, physicians and public alike, this program presents entertainment and education. You cannot afford to miss the sessions of the annual meeting this year at Rochester, from May 24 to 27.

The House of Delegates

As the season approaches when the delegates of our State Society again convene, it must be apparent to all who think at all upon our organization, that grave responsibilities lie here. The constitution of this governing body of medical legislators is truly democratic and representative. Their officers and officials have carried out the sundry mandates imposed on them, and now come back again to give an account of their stewardship. We hear less and less of the "medical trust" and the "dictatorship" of organized medicine. Likewise we see less and less of political log-rolling and political jockeying from the purely personal standpoint. Committees of major importance have carried on a great and heavy burden. The Committee on Economics, under the able leadership of Dr. Frederic Elliott who has almost made of his committee-ship a life-work, the fine and far-reaching work of the Committee on Public Health and Medical Education, under the guidance of Dr. Thomas P. Farmer, Dr. Augustus J. Hambrook's excellent handling of the Committee of Public Relations, and the important work and strategy by which the Committee on Legislative Work mastered and held the Society's viewpoint before our state legislators, and the masterly manner in which its chairman, Dr. Homer L. Nelms, interpreted state legislative trends to us, are but a few important items in pointing the tale.

The work of the newer Committee on Trends under Dr. Terry M. Townsend's

directing genius, and the work of Mr. Dwight Anderson are familiar enough because of the releases which come to us with singular regularity. Of Dr. William A. Groat's work we shall see visual evidence at the meeting.

In view of the smoothness, harmony, and team-work of Dr. Winslow's administration forces, it is hoped that the delegates will assemble in like harmony and accept the obligations which their professional colleagues place upon them. Let us have all topics fully and freely discussed, with little heat and much light, and let us face the future together, a fully united professional unit, not one of the weakest, but one of the strongest links in the nationwide chain constituting organized medicine.

Resolution for Action by the House of Delegates

Because a preview of the amount of work which confronts the next meeting of the House of Delegates shows that every effort must be made to conserve the delegates' time, so that full and considered deliberations may be accorded every topic brought before its sessions, the Executive Committee, at its regular March meeting, passed a resolution presented by the Speaker to facilitate the consideration of business.

Stripped of its parliamentary verbiage, the intent of the resolution is, that resolutions originating officially in county societies may be sent to the office of the Secretary and be assigned to reference committees by the Speaker before the House meets. Such reference committees, according to our present By-Laws are appointed one month prior to the meeting of the House of Delegates. The reference committees, which receive such resolutions prior to the assembly of the House, will meet on the Sunday prior to the meeting and thus will be able to study such topics and projects, and be ready to report promptly after the House convenes. Of course, the resolutions must be presented *pro forma* at the open-

ing session and then officially referred to make the matters legal and parliamentary. In other words, a procedure has been worked out, this year, to facilitate the transaction of business, in regard to resolutions emanating officially from component county societies. This is exactly analogous to what has heretofore been done in regard to the official reports of our officers and standing committees.

If your county society has any official resolutions to present, send them as soon as convenient to the Secretary.

CURRENT COMMENT

"IT IS AND WILL BE A SAD DAY for the intellectual life of a nation and society when creative and logical thinking in an unhampered atmosphere is destroyed. Equally sad will be the day when we do not listen to the tempering warning from those who are trying to 'get the job done.' Blending of the two is the deterrent to dogmatic slavery. * * * We can prove but one thing, that our problem will be solved by recognizing the absolute dependence of academic thinking and practical application upon one another. The closer we can draw these together in mutual understanding the sooner a real social democracy will flower."—A statement of opinion voiced by H. L. Wells, writing in *Commerce*, of recent issue.

"* * * OUR OPPORTUNITIES in organized medicine are obvious. One would scarcely qualify as a major prophet on the basis of the prediction that political effort will be made to extend the activities of government in the field of medicine. Medical men will do well to study the implications of the social theories which are being so freely aired today. * * * Politicians who perform the actual work of legislation frequently are not acquainted with either social or medical science and are not inclined to heed expert advice unsupported by political power. They are adepts at adjusting conflicting forces to make a temporary structure. In the important social changes which are impending we ourselves must see to it that the physician is not relegated to the role of the 'forgotten man' * * *"—From the Presidential Address delivered at the meeting of the Alumni Association of the Mayo Foundation by Dr. Stanley J. Seeger.

"* * * THE FIGHT WILL LAST LONG and will require both courage and patience. It must be a matter of personal responsibility undertaken willingly in memory of those who have suffered and for the protection of hundreds of thousands who need no longer do so. No one is so busy that he can afford to neglect his part in the united effort to check the silent inroads of a cruel killer. * * *"—Editorial comment on the National Cancer Campaign in the March issue of *Illinois Medical Journal*.

"REBEL SPANISH TROOPS who captured a hospital from Loyalists last month were surprised to find a Russian, his abdomen laid open, stretched out on an operating table. Apparently the surgeon had fled when bullets whined too close. Rebel operators finished the job, removing a sizable shell fragment."—The irony of war commented upon by *Medical Economics* of March 1937.

"THE JOB OF STAMPING OUT SYPHILIS will pay for itself and pay dividends. Our economic stresses are difficult enough without the extra load of a syphilis-ridden population. Syphilis cannot be downed in a year, or a decade, but we have already dragged the specter of the spiral death into the light, seen it to be conquerable and it will be strange indeed if we do not prevail against it."—Thomas Parran, M.D., writing in the April 1937 issue of *Readers Digest*, and stating that "Syphilis Can Be Stamped Out."

MEDICAL RADIO BROADCASTS

The Medical Information Bureau of the New York Academy of Medicine announces the following broadcast from Station WABC and the Columbia broadcasting system network.

Wednesday, April 21, 4 45 P.M.—
Speaker Dr. Robert L. Levy, Director of Cardiac Dept., Columbia Presbyterian Medical Center. *Subject* "The Symptoms of Heart Disease."

Annual Reports

MEDICAL SOCIETY OF THE STATE OF NEW YORK

1936-37

REPORT OF PRESIDENT

To the House of Delegates, Gentlemen

In conformance with established custom, as President of your Society, I hereby tender to you my annual report for the year 1936-7

General Activities of the Society

Developments of the past year have served to emphasize the changing order in medical society affairs throughout this country. The Autumn of 1936 saw this nation again locked in the throes of a national election. This election was especially significant because it saw the proponents of marked social changes in our fundamental system of government engaged in a struggle with their opponents. Probably never before has a national election presented issues so vital to the profession of medicine. Coincidentally there developed upon the profession the duty of placing before the doctor and before the public, the position which medicine should take with regard to the questions at issue. In the days gone by it was enough for the doctors to meet for the discussion of their problems distinct and separate from any other group. They were strictly a deliberative assembly and enough had been done when a resolution had been passed and every one went home to forget about it. In these days, however, with mass movements representative of various interests and causes, it is incumbent on medical societies to be organized for the active carrying out of the results of their deliberations. Part of this activity must be the persuasion of other individuals and groups, to our way of thinking, if the standards which have been continued throughout the years are to be maintained.

The officers and committees of your

society have actively participated in the discussions of the problems at issue, in the field of organized medicine and we have faithfully endeavored to set before the public, in spoken and in written word, the methods of maintaining professional ideals and in advancing the interests of the public and the doctor.

The result of the recent national election is well-known and can never be recalled. Whatever the ultimate settlement of the issues involved on this occasion may be, it is hoped that, as a result of the activities of the representatives of your society, the American public has an increased knowledge of and respect for the principles which underlie the practice of our profession.

District Branches

Your President attended all but two of the district branch meetings and in all instances an increased interest in the proceedings of these branches of the parent organization was experienced. Beyond question, the sentiment of our membership is strongly in favor of the preservation of the District Branch meetings together with an effort to make these meetings an increased source of scientific inspiration to the practicing physician.

County Societies

Your President has been particularly interested in the progress of the component county medical societies throughout the state and has made an effort to attend their meetings on every possible occasion. It becomes increasingly apparent that, everywhere throughout the field of medicine in America, the County Society is the most vitally important unit of that great structure which we recog-

nize as ORGANIZED MEDICINE. Your officers and your committees have vigorously directed their efforts toward building up these county societies during the past year throughout the state. We feel that the annual meeting of the secretaries of these societies is a valuable agency in advancing their work. We commend the efforts of the county society officers and bespeak their further constructive efforts in the conduct of their organizations.

Executive Committee

This year, for the first time, the Executive Committee has been favored by the attendance at its meetings of the members of the Board of Trustees and also by the attendance of the Chairman of the standing committees. These representatives have been invited to express their views on all questions involving the procedures of their particular subdivisions of the executive structure. They were, however, without vote. We feel that this has been a valuable method of procedure because at each meeting it gave the trustees opportunity to correctly evaluate the needs of the society in the way of budgetary appropriation. Furthermore, it gave an opportunity for the committee chairman to gain direct knowledge as to the desires of the Executive Committee in advancing the work of the society. A further notable advantage of this plan has been the fact that it furnished the opportunity to allocate the work of the different committees and to prevent the overlapping of committee work which has been apparent in the past. Publication of the proceedings of the Executive Committee in the JOURNAL has provided a satisfactory method of carrying promptly and directly to the membership an outline of the work being carried on by their representatives together with an indication of the stand taken by the Executive Committee on important current problems. This plan has also served to cut down the number of committee meetings.

Standing Committees

Scientific Work Under the capable leadership of Dr. William A. Groat, this

committee has carried on a year of steady, conscientious work in arranging the program for the oncoming annual meeting. As a result of this activity the program for this meeting will bring to our membership opportunities for improving their professional equipment hitherto not experienced.

Public Relations Dr. Hambrook and his committee have interested themselves in such problems as the examination of school children and the problem of the care of the deaf and hard of hearing of the State.

Economics Under the Chairmanship of Dr. Frederic E. Elliott, this committee during the past year has endeavored to carry the active discussion of economic matters to the local County Society meetings.

Among other issues prudently considered by this very active committee has been the problem of the possibility of the adoption within this state and by this society of some plan of Medical Expense Indemnity Insurance. While up to this time no plan has been found by the Executive Committee to be ideal or completely applicable to our needs, nevertheless the thoughtful consideration by this committee of the problems involved has placed our society in an advantageous position with regard to future action on this issue.

Public Health and Medical Education This committee, of which Dr. Thomas P. Farmer is Chairman, has promoted the health and well-being of the citizens of the State by the conduct of the following sub-divisions of its work:

- 1 Courses in Graduate Education
- 2 Pneumonia Control
- 3 Cancer control and investigation
- 4 Syphilis
- 5 Maternal Welfare
- 6 Child Hygiene
- 7 Nursing Education

These activities have increased our professional capacities and have also increased the popular acceptance of our capacities. Your attention is hereby called to the growing importance in the field of medicine of the subject of Cancer Control and Maternal Welfare. Leadership in the investigation and control of

these subjects is logically the responsibility of our society and the hope is hereby expressed that, profiting by the successful handling of these subjects in the past, our society, through its appropriate committees, will reach new heights of leadership in the future

Committee on Legislation Under the Chairmanship of Dr Homer L Nelms About six thousand bills are introduced into our State Legislature each year It is the duty of the Legislative Committee to scan each of these bills in order to protect the public against the passage of legislation providing for inferior medical care and so far as possible to further legislation favorable to the proper development of matters of public health The outstanding activities of this committee during the current year are as follows

- 1 Study of the Cancer situation in the State

- 2 Conferences with the State Board of Regents providing for rulings on the examination of foreign physicians

- 3 The Medical Lien Bill

- 4 An attempt at passage of amendment to the law so as to discontinue the licensure of physio-therapy technicians

- 5 Efforts to prevent medical advertising by licensed physicians who are not members of the county society

Committee on Arrangements Under the leadership of Dr Leo F Simpson, preparation of the plans for the annual meeting of the Society are rapidly being completed and we confidently believe that the 1937 meeting of the Society will be one of the most satisfactory ever held

Special Committees

Committee on the Revision and Reconstitution of By-Laws (Dr O W H Mitchell, Chairman) At the Annual Meeting of the House of Delegates in 1936 a measure was passed providing for the appointment of this committee This mandate of the society placed an imposing burden of responsibility upon the personnel of this committee However, in accepting this appointment for service, the members of this committee have demonstrated the very highest ideals of devotion to the interests of the society throughout this year of arduous effort As a result of their unremitting efforts

throughout the year, they currently present to the society a well thought out plan for simplifying and modernizing the rules of conduct of this society I commend them for their sincerity and their earnest efforts and bespeak your prudent consideration of their suggested plans

Bureau of Public Relations In the year 1935, during the administration of Dr A J Bedell, having for its chairman, Dr J F Rooney, this society established the Bureau of Public Relations This Bureau was placed under the charge of the Committee on Trends and since its inception has had as its director, Mr Dwight Anderson The purpose of this Bureau was to interpret the trend of public opinion on medical matters It inaugurated a policy of constructively placing before both the members of the State Society and the public, the facts in connection with various subjects affecting organized medicine Under the leadership of its present Chairman, Dr Terry M Townsend, and with the able support of its Director, Mr Dwight Anderson, this committee has completed a year of successful work This committee has numbered among its members the chairman of each of the standing committees and this construction of the committee has been a powerful element in the advancement of the work of this bureau and the society as a whole It has the following advantages

- 1 It has served as a means for providing the director of the Bureau with an exact knowledge of the current work of the standing committees

- 2 It has furnished an opportunity for each chairman to clearly outline his function

- 3 It has prevented overlapping of committee work

- 4 It has given opportunity for each chairman to keep abreast of the work of the Bureau

- 5 It has materially cut down the number of committee meetings and has thus been an economic asset to the society

Profiting from its inception through the leadership of Dr Rooney, Dr Townsend, and Mr Anderson, this committee has risen rapidly in its value and service to the society It is now able to place before an interested public the facts in-

volving the consideration of the medical profession. Furthermore, this Bureau furnished opportunity for a uniform expression of opinion among those who publicly speak for the society and to a large extent it eliminates the lack of conformity previously existing among the expressed views of the leaders of our society. Naturally, the conduct of such a bureau involves considerable expenditure and if our members expect to continue to reap the benefit of such a department of our organization they should expect to provide adequate financial support. Recently the formation of a speaker's bureau has been completed. This is another favorable asset to the society. From all over America and from both laymen and professional men I have had expressions of commendation for the work this bureau is doing in advancing the interest of organized medicine and I know of no other similar organization in existence of equal value.

Committee on Hospital Relations. A special committee of this society has held several conferences with a similar committee representing the State Hospital Association. Considerable advancement has been made toward the solution of the mutual problems of these two organizations and it is hoped that in the near future still further progress will be made.

Committee on Workmen's Compensation Procedure. This committee has consolidated the plans previously developed and has ably represented the society in the deliberations involving the other agencies interested in this problem, namely, Labor, the Employer, and the Insurance Carrier.

Finances

In common with other organizations and under the direction of our Treasurer, Dr. Kosmak, this society shows signs of steady recovery from the effects of the recent economic adversity. Dr. Kosmak's report shows our financial status to be sound.

Reading the JOURNAL since the changes in the methods of the publication of the JOURNAL were inaugurated in 1934, this publication has steadily improved in character. Two objectives were sought

and both have been reached, viz, the cost of production has been reduced and professional interest in this publication has increased. Now attracting deserved attention from the profession both within and without the State, it is hoped that this publication will continue to still further reflect the scientific advancement of our society. The editorial department of the JOURNAL has abandoned its former attitude of "passive resistance." It has adopted a positive attitude in its expression of the position of this Society on medical matters. I believe the time has come when everybody will accept a positive program in this respect if organized medicine will have the courage to evolve one.

Recommendation

Recently a bill was introduced in the Legislature of our state providing for an increase of one hundred beds in the State Institute of Malignant Diseases in Buffalo and also for the construction of two hospitals for the investigation and treatment of cancer. Naturally, our Society was approached with regard to their stand on this bill. Unfortunately, we did not have at our disposal adequate facts relative to this subject and therefore our ability to give constructive advice was greatly hampered. Other similar projects have further demonstrated their need along this line. Some of these projects are

- Hospital Insurance
- Tuberculosis Program
- Care of Crippled Children
- Administration of the TERA and Welfare Laws
- Nursing Problem

It is therefore my recommendation that this society take steps to place in the hands of one of our present committees or in the hands of some special Committee, the responsibility of, so far as is possible, looking ahead in matters of Public Health, thereby accumulating the necessary facts and being able to better cooperate with other agencies working toward the development of Public Health.

In closing, it now becomes my pleasant responsibility to express to the members of this Society, my appreciation of the

loyal support I have enjoyed from my Associates within the Society during the past year. No serious contention has arisen within our ranks. From each member of the Society, each committee member, each chairman and each officer I have received that degree of constant loyalty, support and inspiration which has made the memory of this year imperishable. Miss Baldwin, Executive Officer Lawrence, Secretary Irving, Director Anderson, their assistants, and all my fellow officers have applied themselves to the advancement of the interests of the Medical Society of the State

of New York with unwavering devotion. While other years may have seen greater advancement in the work of the Society, nevertheless, in turning the administration over to my successor, Dr. Goodrich, I know that I present to him a group of earnest, devoted workers adequately sensitized to the needs of the Society and anxious to yield to him the same degree of inspired support which I have enjoyed during the past year.

Respectfully submitted,
FLOYD S. WINSLOW, *President*

April 1, 1937

REPORT OF SECRETARY

To the House of Delegates, Gentlemen

It is the purpose of this report to place before you the main features of the secretarial work of the past year, the manner in which the office has met its calls, and to offer some personal comments by your present Secretary.

It was obvious in April 1936 that the mechanism of administration was meeting a demand for a gearing up adjustment to provide not only greater speed in operation but a far wider range of activity not only then and now but for the future. The membership has increased in the last two years by over 2,000 or about fifteen per cent. Changes in the Workmen's Compensation Laws have called upon the Society and its component County Societies to actually assist in the application of the laws as they involve the physicians of the State, not only the members but all non-members. The closer relationship of the Departments of Health and the State Society in efforts to promote public health in such fields as reduction of pneumonia mortality, syphilis control, cancer control, maternal and child welfare implies coordination of committee work through the Executive Committee and the Society's office along these lines. In the field of Public Relations between the Society and the public an extraordinary situation exists which has called for action plus foresight plus wisdom and always close attention on the part of all concerned as well as your Secretary through whose hands instructions of the administration pass. Consideration of medical trends

and social trends of today have led the Society to the conclusion that it could aid the people of the State by a skilful and faithful presentation to the public of the doctor's interest, of his desire and capacity to supply the service they need to get well and to keep well. All these activities, many of them well-known objectives of the medical profession for a long time, have recently grown in amazing fashion.

That the rapid increase in membership which began in 1935 continued in 1936 will be seen from the following table of

MEMBERSHIP STATISTICS

Membership December 31, 1935	13,536	
New Members, 1936	963	
Reinstated members, 1936	315	14,814
Deaths	152	
Resignations	76	228
		14,586
Dropped for nonpayment of dues December 31, 1936		378
		14,208
Elected and reinstated after October 1, 1936, and dues credited to 1937		454
		14,662

Honor Counties include Chemung, Clinton, Columbia, Fulton, Genesee, Jefferson, Madison, Orange, Otsego, Putnam, Rockland, Schenectady, Schoharie, Schuyler, Seneca, Tioga, Warren, Yates, and Saratoga.

With this enlargement of the Society roll in mind and with full knowledge of the other needs which cannot be expressed in figures the administration set forth immediately after your 1936 meeting to do its bigger job

Your President inspired the Executive Committee to take the first step toward more concerted action, and the event has proved him wise. He suggested bringing in to Executive Committee meetings the Chairmen of the Standing Committees, the Trustees, the Directors of Workmen's Compensation and Public Relations Bureau, and others. It has been found useful and time-saving to send the full minutes to each member of the Executive Committee. Agenda of all meetings of the Executive Committee have been sent not only to members but to all invited guests. These changes in method have meant some increase in travel expense, a great addition to the stenographic labor of the office, but, in the opinion of your Secretary, the effectiveness of the work of the administration has been enhanced to a degree far outweighing the extra cost and effort.

With this new gear ratio installed the car has gone faster and further. Compensation changes have gone into operation with astonishing rapidity. Public Health cooperation has achieved a notable success particularly in Pneumonia Control. The profession and the public have been educated in the imperfections of the system called compulsory health insurance. Finally, perhaps best of all, the public of the State—and indeed elsewhere—has been supplied through the press with a picture of the doctor as he really is in a way never done before.

Your Secretary begs to report on his own part in the work and craves your indulgence to make personal comment. He has attended over fifty meetings of the many committees, including conferences of county society secretaries and legislative chairmen, the eight district

branch meetings, the Annual Conference of State Secretaries and Editors in Chicago, etc., etc. He has been in constant supervision of the central office and the publication of the *STATE JOURNAL*, and has been in almost daily contact with the Bureau of Public Relations. He is fully aware of the size and importance of the work and the pressing need for more effort.

He begs to submit his opinion that the District Branches are of scientific and social value and is happy that the Revision Committee has retained them. He is convinced that the Secretary should be in closer contact with the officers of County Societies than has been possible this year.

He felt deeply honored to be selected as Secretary and has been happy to do the work. He has felt to the full the inspiration which comes from acting for an organization whose efforts are worth while because they help people to maintain health.

Your Secretary offers two comments. The first, is that the moment has come when the Society should employ a Secretary on full time. Private practice and the Secretaryship are, in his opinion, no longer compatible. The second is that the Society would do well to realize that for thirty-seven years its office has been managed by one of the most effectual, most responsible and most delightful personalities that it has been your Secretary's privilege to know, Miss Baldwin, who will retire on June 1 next. Your Secretary recommends that you make permanent the action of the Executive Committee in appointing Miss Baldwin to the position of Office Manager Emeritus with a salary of \$3,000 a year as long as she lives.

Respectfully submitted,

PETER IRVING, *Secretary*

April 1, 1937

REPORT OF COUNCIL

To the House of Delegates, Gentlemen

The Council has the honor to report on its conduct, as the executive and administrative body of the Society, of the

affairs and business of the Society during the year that has passed since your last meeting on April 27, 28, 1936.

The Council first decided to accept the

invitation of the Chamber of Commerce of Rochester to hold the next Annual Meeting in 1937 in Rochester

It proceeded to elect five members of the Council to complete its Executive Committee as provided in the By-Laws, Drs James M Flynn, Samuel J Kopetzky, John P J Cummins, H Wolcott Ingham, Thomas W Maloney The Executive Committee thus formed is

Dr Floyd S Winslow, Rochester, the President

Dr Charles S Goodrich, Brooklyn, the President-Elect

Dr Frederic E Sondern, New York, the immediate Past President

Dr Peter Irving, New York, the Secretary

Dr George W Kosmak, New York, the Treasurer

Dr Samuel J Kopetzky, New York, (also Speaker)

Dr James M Flynn, Rochester, (also Vice-Speaker)

Dr Thomas W Maloney, Geneva, (also Councillor Seventh District Branch)

Dr John P J Cummins, Ticonderoga, (also Councillor Fourth District Branch)

Dr H Wolcott Ingham, Jamestown, (also Councillor Eighth District Branch)

The Council held its two statutory meetings on April 28 and December 10, 1936, and its Executive Committee has carried on the work in the interim by monthly meetings, nine up to time of going to press (April 1) held in April, May, June, September, October and November, 1936 and January, February and March, 1937, with two yet to come in April and May

Most of the work of the year has been done by the Executive Committee as will appear below The Council itself on December 10, 1936, took definite action in a matter of more than ordinary importance to the hospitals and the medical profession of New York State, namely *Limitation of Administration of Anesthesia to Licensed Physicians and Dentists*

The House of Delegates in 1936 issued a mandate for introduction of a bill in the 1937 session of the State Legislature to prevent others than licensed physicians and dentists from administering anesthesia except in emergency The Council

received reports from various sources, particularly from the Committee on Legislation, which carried conviction that it would be this year at least unwise to press for this desirable legislation The Council, therefore, formally resolved to rescind this mandate subject to a referendum vote by mail of the 1936 House of Delegates The following ballot with informative memorandum was sent to the members of the 1936 House of Delegates

EVENTS AND INFORMATION considered by the Council in deciding that it would be unwise to attempt in 1937 to effect legislation looking toward limitation of "administration of anesthesia to duly licensed physicians and dentists, except in cases of emergency"

I The mandate of the 1936 House was duly passed to the Committee on Legislation, and that Committee has been prepared to act in accordance—unless instructed to the contrary

II The Legislative Committee has at times since April 27, 1936 reported to the Executive Committee and finally to the Council certain facts of which it had been earlier aware and which it later learned It has found that there is much opposition to the passage of a law at this time because of these facts It has drawn up a memorandum which accurately states the present status of the matter in the following words

"In anticipating legislation on this subject, the Committee has encountered certain important facts which are of special interest at this time This matter was sponsored under the so-called 'Crawford Bill' and failed of enactment two years ago There are on file in the Legislative Bureau letters of protest from some of the most representative members of the State Society vigorously opposing legislation of this nature We also have protests unanimously adopted by the attending staff of representative hospitals throughout the State opposing this legislation

"The Committee has also interviewed many physicians at random throughout the State and finds that there is a general conflict of opinion as to the wisdom of this proposed legislation at this time The Legislative Committee undertook to consult with many leading anesthetists of this

State, who are members of the State Society, and who represent recognized state and national organizations on anesthesia, and found them to be of the unanimous opinion that this is not an opportune time to seek such legislation. These specialists in anesthesia asked that action be postponed for several reasons. First, that there is not now a sufficient number of medical men willing to take up anesthesia to take over the entire work, second, that there are still many prominent physicians, surgeons, and hospitals which prefer nurse anesthetists (of whom there are now about 700 in the State), and if given time they feel that they can remove a great portion of this opposition. We have a letter from the Chairman of the new Session on Anesthesia of the State Society, advising that action be postponed.

"From a practical standpoint we must conclude that the profession itself is divided as to the wisdom of this proposed legislation at this time. In this connection we can also anticipate the vigorous and sustained objections of certain hospital and nursing groups. Such militant and widespread opposition has a way of crystallizing itself in legislative halls, and with these hazards already facing such a bill, only the most visionary optimist could hope for its enactment into law at this time.

"The legislative Committee is in entire accord with the principle that anesthesia should be developed as a special branch of medicine. We believe that true progress in this field can come only through original observation and research by medical men. From a scientific standpoint we believe that progress is being retarded because this field has been taken over by others. We recommend that the State Society through all its agencies—educational, scientific, and publicity—stress the scientific phase of the practice of anesthesia, encourage and sponsor facilities through which physicians can equip themselves to assume the growing responsibilities which the administration of not only the older, but the newer anesthetic imposes upon us. This done effectively, the proposed legislation will then stand a better chance of enactment."

III On December 10, 1936, there appeared before the Council Dr T Drysdale Buchanan, representing the New York members of the American Society of Anesthetists, and Dr Paul Wood of the American

Society of Regional Anesthesia. These gentlemen counselled postponement of action for this year, at least—if not longer. Both were strongly in favor of limitation of anesthesia to physicians only, but both were of the opinion that no legislation to that effect should be supported this year, or until a sufficient time has passed to allow for training of sufficient physicians to replace the large number (700) of nurses now regularly giving anesthesia in the State.

IV With this gradually increasing information, culminating in the counsel of the anesthetists themselves, the Council, although in full sympathy with the idea of eventual limitation of anesthesia to physicians and dentists only, found itself wholly in favor of delay in pressing for legislation. It, therefore, took the action for 1937 indicated in its formal rescinding resolution.

FLOYD S WINSLOW, *President*
PETER IRVING, *Secretary*

January 11, 1937

Referendum Ballot

To Member of 1936 House of Delegates
From The Secretary of the Medical Society of the State of New York

As directed in Chapter IV, Section 5 of the By-Laws, a question is submitted below which requires your vote as a member of the 1936 House of Delegates.

The By-Laws state that the Council "shall also have power to legislate as a House of Delegates, when the latter is not in session, on all matters consistent with the Constitution and By-Laws. Such legislative action of the Council shall not become effective or binding on the Society until approved by a majority of a referendum vote of the House of Delegates, provided a majority of the House of Delegates vote thereon within fifteen days after the mailing of the question submitted for referendum. The Secretary shall send the question for referendum vote to all the members of the House of Delegates."

On April 27, 1936, the House of Delegates recorded a mandate "That the proper committee of the Medical Society of the State of New York be directed to draft and promote at the 1937 session of the New York State Legislature a bill to limit the administration of anesthesia to duly licensed

invitation of the Chamber of Commerce of Rochester to hold the next Annual Meeting in 1937 in Rochester

It proceeded to elect five members of the Council to complete its Executive Committee as provided in the By-Laws, Drs James M Flynn, Samuel J Kopetzky, John P J Cummins, H Wolcott Ingham, Thomas W Maloney The Executive Committee thus formed is

Dr Floyd S Winslow, Rochester, the President

physicians and dentists except in cases of emergency."

On December 10, 1936, the Council rescinded this mandate by the following resolution "That the action of the 1936 House of Delegates which gave the mandate to the Committee on Legislation to support a bill limiting the giving of anesthesia to physicians be rescinded—this action to be submitted (as provided in the Constitution and By-Laws) to a referendum vote of the 1936 House of Delegates, and that as an aid to voting, a circular be formulated and distributed to the members which shall set forth the reasons why the Anesthesia Societies advise delay."

THE QUESTION IS SHALL THE ACTION OF THE COUNCIL IN RESCINDING THE ABOVE MANDATE OF THE HOUSE OF DELEGATES BE APPROVED?

In order to aid you to make a decision as directed by the Council, there is attached a memorandum of the events and information which led the Council to its conclusion to rescind.

Please indicate your vote hereon, *sign*, and return at your earliest convenience to me, before January 26, 1937, (when the statutory fifteen days will have passed)

PETER IRVING, M D, Secretary

Memorandum

to

Members of 1936 House of Delegates

Of the 192 members of the House, 165 replied, eight disapproved rescinding the mandate, but 157, far more than the majority required by the By-Laws, approved the action of the Council. It was, therefore, ordered by the Council that no such legislation be sought during the period before the meeting of the House in 1937.

Information for New Licentiates

The Council, at its meeting on December 10, 1936, on recommendation of the

Committee on Public Health and Medical Education resolved

That the State Department of Education be asked to prepare a pamphlet for issuance to all new licentiates—the pamphlet to contain the essential information in regard to technicalities in the Education Law to be observed by all physicians, particularly in the matters of local registration and annual registration, and

That the State Department of Health be asked to issue to all new licentiates a revised pamphlet to contain information essential for every physician to know in regard to the Public Health Law and to obtain through proper authority a similar statement of the Sanitary Code of New York City

Executive Committee

The bulk of the Council's administrative work has been conducted by the Executive Committee as indicated in the following report

In addition to routine matters such as remission of dues on account of ill-health, approval or disapproval of changes in their Constitutions and By-Laws proposed by County Societies, communications of minor import, the Executive Committee of the Council has taken action within its province in various matters that have come to it either by recommendation of Standing and Special Committees or from other sources or from within its own membership. It has carried out its duty to supervise malpractice defense and the group plan for insurance against malpractice through its Insurance Committee. It has carried out its duty to supervise publication of the NEW YORK STATE JOURNAL OF MEDICINE and the Medical Directory of New York, New Jersey, and Connecticut. The report of the Journal Management Committee is presented herewith in full.

The obligation of the Executive Committee to select personnel of all committees other than elected Chairmen of Standing Committees resulted in appointment, on nomination by the President, of all the necessary members so that the working committees were finally constituted as follows

of possible legislation in the matter have been made by the Committee on Legislation as well as by the Committee on Economics. The Executive Committee has repeatedly discussed the matter during the year and adopted the following resolutions on Feb 11, 1937

1 We define Medical Expense Indemnity Insurance as a form of insurance whereby an individual, by making payments of stated premiums, purchases a definite sum of money *in cash*, which is thus made available to him for the payment of the individual's physician's charges for professional services. We recommend endorsement of such a form of insurance

2 We would add that in our opinion the physician's claims for his professional services should be a first lien on the cash indemnity

3 That the Medical Expense Indemnity Insurance Plan must be carried out on an actuarial basis

4 That philanthropy has no place in a Medical Expense Indemnity Insurance scheme or plan to deliver cash benefits to those who pay its premium requirements, so as to have funds to meet physicians' charges for services

Following this declaration of its belief the Executive Committee called for and received a proposed draft of an Enabling Act. At the time of writing this report (April 1, 1937) the matter is still pending before the Executive Committee

Group Practice

The Committee on Economics, after a study of the implications of what is called "group practice" made recommendation that the Society go on record as to behavior of such groups. The Executive Committee adopted the recommendation in the following words

That it be the expressed opinion of the Medical Society of the State of New York that groups of physicians, practicing as such, should remain within the same framework of restrictions as to their conduct as though the activity were that of an individual physician. In other words, we feel that a group may not obtain publicity, by any means, in lay publications, that it should not solicit or advertise, that it should not claim superior quality or service and it

should not practice competitive fees against the individual physician of the community. If the group conforms to this and relies solely upon the recognition of its service by the people of the community as its sole means of acquisition of patronage, it would seem to be a proper and fair activity. On the other hand, if the group by subterfuge courts the patronage of the community by enjoying any form of publicity, it would seem to us that each member physician should be considered personally guilty of misconduct

Workmen's Compensation

The Executive Committee, on recommendation of the Committee on Workmen's Compensation Procedures, went on record as favoring the promulgation of a state-wide fee schedule, the same as already set for the Metropolitan area. So far Commissioner Andrews has not seen fit to promulgate any fee schedule for the State outside the Metropolitan area.

In the matter of indicating in the Directory the qualifications of physicians for general and special work under the Compensation Act, as set by County Society Boards, the Executive Committee directed the JOURNAL Management Committee to arrange appropriate designations for the 1937 Directory. This instruction was carried out. Necessarily, in the first year there have occurred errors, but the JOURNAL Committee is perfecting the mechanism for future editions

New Session on Regional and General Anesthesia

The Executive Committee acted favorably on the suggestion presented to the House of Delegates and passed down through the Council for the creation of this new Session. There were appointed for the year 1936-1937

 Renewal of Contract.

At its first meeting on April 28, 1936, the Executive Committee decided, on suggestion of the President, Dr. Winslow, to invite to its meetings the five Trustees, the six Chairmen of Standing Committees, and later extended the invitation to the Executive Officer, Dr. Lawrence, the Assistant Secretary, Dr. Podvin—as had been customary in former years—and also as a new departure, to the First Vice-President, the Director of Workmen's Compensation, the Chairman of the Committee on Trends, the Director of the Bureau of Public Relations. All these guests received the privilege of the floor for discussion in the hope that the Executive Committee could thereby be aided in reaching conclusions on all matters before it for consideration. The Executive Committee, after eight meetings, is convinced that these guests have contributed largely

Health Education

On recommendation of the Committee on Public Relations, the Executive Committee resolved

That a survey by the State Education Department of health education programs through the State be endorsed, as well as the proposed selection of Dr. Cyrus H. Maxwell of Auburn, to direct the survey

Pneumonia Control Program

In connection with the extension in the summer of 1936 of the Pneumonia Control Program to New York City, a request was received from the Pneumonia Committee of the five Metropolitan County Societies for appointment of a representative to sit with that body. Dr. Peter Irving, New York, was designated. The Executive Committee signified its approval of the establishment of this Committee, which had been followed by the appointment by Dr. John L. Rice, Commissioner of the Department of Health of New York City, of an Advisory Council on Pneumonia Control for his Department in New York City. The entire State thus is now included in this public health effort which was initiated by the Medical Society of the State of New York, and the two large Departments of Health now have Advisory Councils on Pneumonia Control composed of members from the various organizations most concerned. Many of the members serve on both of these advisory councils so that a beneficial "interlocking directorate" can now advise both Health Departments.

Federal Department of Health

It was resolved that

The Medical Society of the State of New York urge that the reorganization of the Federal Government combine in one Department all medical and health activities, making this a separate and distinct Department, and urge especially the nomination as Chief Executive Officer of such a Department of a qualified physician with a record of achievement in administration.

Medical Expense Indemnity Insurance

Studies on this subject over a long period of time have been made by the Committee on Economics, and studies

(e) In each community under the supervision of its organized medical group there shall be developed the details of this plan so as to meet local conditions and make it workable.

On recommendation of the Committee on Economics a *re-statement* was adopted which would rescind sub-sections (a), (b), (c), (d), (e) of Proposition No 3 above and substitute the following

(a) Hospital care shall mean provision of bed, board, general nurse service, customary surgical dressings and medicines, and other facilities of the institution not including medical care, as defined in (b)

(b) Medical care shall mean any procedure or service by a licensed physician acting under authority of Section 1250 of Article 48 of the Education Law of the State of New York.

(c) Hospitals making contracts with organizations, acting under Chapter 595 of the laws of 1934—the Insurance Law of the State of New York—shall not implicate themselves with conditions inconsistent with the principles and definitions herewith stated.

(d) The operation of such hospital insurance in any community shall not discriminate against any reputable institution, whether voluntary or proprietary

(e) Admission of patients for care under the benefits of such hospital insurance shall be only through reference by a private physician. Exemption to this provision shall be made for the exigency of any emergent need.

(f) Certificates of membership in such association shall specifically state that the insurance does not provide for any medical care as defined in (b). Actual wording of the certificate to be approved by the local County Medical Society or Societies

(g) Every hospital insurance plan operating under the egis of this Proposition shall develop the details of its operation to conform with such principles and policies as from time to time may be determined by the local County Medical Society or Societies

(h) When it is so desired by the local County Medical Society satisfactory representation from the membership of the local County Medical Society on the Board of Management of the hospital insurance shall be arranged

Protest on Walch Pamphlet

On March 11, 1937, the Executive Committee received and filed without action the following resolution

Whereas, the State Medical Society has recently distributed among the profession through its Public Relations Bureau a pamphlet entitled, "On the Witness Stand," and

Whereas, the said pamphlet is purported to be an impartial statement concerning socialized medicine, and compulsory health insurance, and

Whereas, this so-called impartiality is certified and attested to by the State Society insofar as the State machinery and funds made possible both the printing and distribution of said pamphlet, and

Whereas, so far from being impartial, this pamphlet contains numerous distortions of facts easily ascertainable, as well as statements that are almost untruths, thus giving it a decided and deliberate bias, and

Whereas, we, the members of the Bronx County Medical Society, were never informed beforehand of the intent to distribute such a pamphlet, be it therefore

Resolved, that the Bronx County Medical Society register its protest against the State Society's lending its prestige and endorsement to a campaign of misrepresentation, and be it

Further Resolved, that a copy of these resolutions be submitted to the State Medical Society

Licensing of Foreign Physicians

The Executive Committee heard with gratification that the Board of Regents had resolved

That on applications filed after October 15, 1936, no license of a legally constituted Board of Examiners in any foreign country shall be indorsed, pursuant to the provisions of Section 51 of the Education Law, until the applicant shall pass the licensing examination prescribed by law or Regents' rule

Malpractice Defense Insurance

Because frequently there is an interval of months between application for membership and election, it was thought wise to adopt the following resolution

That a temporary binder be issued to any

the Committee with Drs M J Fein, Nathan C Foot, and Ward J MacNeal, members of the New York State Committee on Economics of Pathology. The Executive Committee believes that pathology is fundamental in medicine and that such a Section or Session would be advantageous.

Nomination to Board of Psychiatric Examiners

In response to formal request by Dr Frederick W Parsons, Commissioner of the State Department of Mental Hygiene, there was nominated Dr Israel Strauss, New York, to serve under the new law on the newly created Board of Psychiatric Examiners. Dr Strauss later received formal appointment.

Nominations to Grievance Committee

In response to formal request by Dr Harold Rypins, Executive Secretary of the Grievance Committee, there were nominated to fill two vacancies on the Grievance Committee of the State Department of Education, created by conclusion of the terms of office of Drs Frederick H Flaherty and Austin G Morris.

To succeed themselves

Dr Frederick H Flaherty, Syracuse
Dr Austin G Morris, Rochester

Alternates

Dr Samuel J Kopetzky, New York
Dr Frederic E Sondern, New York
Dr George W Kosmak, New York
Dr Peter Irving, New York

Dr Flaherty and Dr Morris later received formal reappointments.

Nomination for Honorary Membership

The Executive Committee received the following nomination signed pursuant to the By-Laws by three members

December 22, 1936

Executive Committee
Medical Society of the State of New York
2 East 103rd Street
New York, N. Y.

Gentlemen —

The undersigned members desire to nominate for Honorary Membership in the

Medical Society of the State of New York
Dr Jose Arcé, Professor of Surgery,
University of Buenos Aires, Buenos
Aires, Argentina

We beg that you present this at the meeting of the House of Delegates in May, 1937, as prescribed by the By-Laws, Chapter I, Section 4.

Very truly yours,
FLOYD S WINSLOW
JOSEPH J ELLER
CHAS GORDON HEYD

The Committee *recommends* that the By-Law requiring a wait of one year be suspended so that the House may proceed to elect Dr José Arcé to Honorary Membership at its 1937 meeting.

Re-Statement of Proposition No 3 of the Booth Report

This part of the Booth Report, which was adopted by the House of Delegates in April 1933, reads as follows:

Proposition No 3

There is in every community a group of people below the "comfort level," on whom the costs of medical care impose a heavy burden. These are self-respecting people of the salaried class in most instances, whose living expenses are met from their weekly earnings. For them the greater part of medical costs comprise charges for hospital and nursing care.

To lessen the burden of hospital and nursing care for this wage-earning group, *your Committee recommends* the adoption generally of a plan of hospital insurance, whose principles may be stated as follows:

(a) Members of employed groups may receive for the payment of a small annual sum hospital care in semi-private accommodations for a period of 21 days in any one year, such care to include bed and board, general nursing service, x-ray and laboratory examinations.

(b) All reputable voluntary hospitals and some proprietary hospitals be entitled to participate in this plan.

(c) Except in emergencies, all admissions of patients cared for under this plan must be made through the patient's personal physician.

(d) Certificates of membership issued to subscribers shall state specifically that the service does not cover the fee of the patient's physician.

the new Workmen's Compensation Law. Necessarily, there have been mistakes in these data in the first year. Next year these errors should not occur, because the yearly card sent to each doctor will carry a blank space where he can insert his own letters and numerals.

In the matter of listing certification by National Boards of Specialties new designations have been inserted. Next year each member can indicate his status on the card.

The Committee has carefully considered many suggestions from members for listing of membership in various organizations, of past hospital affiliations, etc. The Committee has deemed it wise to record membership only in scientific medical organizations, local or national, but not foreign. Past hospital positions would, it is thought, make very interesting reading on the order of "Who's Who", but such inclusions would make an unwieldy book. After all, the Committee thinks, the purpose of the Directory is to supply information of assistance to physicians in reference work for traveling patients.

Respectfully submitted,

GEORGE W. KOSMAK, *Chairman*

SAMUEL J. KOPETZKY

THOMAS M. BRENNAN

WILLIAM A. GROAT

NATHAN P. SEARS

PETER IRVING, *Secretary*

Retirement of Miss Baldwin to the Position of Office Manager Emeritus

At the meeting of the Executive Committee on June 11, 1936, Dr. Nathan B. Van Etten, Trustee, asked and was granted the privilege of the floor. He said:

"I have been in the active work of organized medicine for a great many years and in the work of the State Society, directly or indirectly, for thirty years. I have seen the State Society grow until it has become a great powerful organization. I suppose this is one of the best organized Societies in the world, except the American Medical Association, which is the largest Medical Society in the world. I have seen this Society develop through the work of a good many people, I have seen it especially develop

through the work of one person. When I first became acquainted with the Society I felt, as most of us did, that one person was very largely responsible for the supervision, for the faithful attention to every detail in this Society, for the conservation of our resources, as well as the conservation of our ideals. This was due to one person—Presidents, Secretaries, Treasurers—officers of all kinds have come and gone during the time that I have been connected with organized medicine in the State of New York. This one person is Miss Baldwin.

"It is with considerable emotion that I speak at this time, and I had hoped to live long enough to be able to make the suggestion that I am going to make to you gentlemen today. It is very nice to say 'Thank you' to people when they retire from office and that you are very glad they have accomplished so much for medicine—and we very often wait before we do these things until the person whom we think we are honoring is ill, incompetent to proceed, or perhaps has even passed away, when our thanks are expressed by a subscription to a wreath or a floral decoration. I think that in view of the long and marvelous services that have been given to the Medical Society of the State of New York by Miss Baldwin, it would be most fitting and appropriate to retire her, adding an Emeritus to her title. I, therefore, would suggest that someone make a motion to that effect, with recommendation to the Board of Trustees for a salary of \$3,000 per annum as long as she lives."

On motion by Dr. Kopetzky, seconded by Dr. Goodrich, and unanimously carried, it was decided that Miss Baldwin be retired with the title "Office Manager Emeritus" at such time as may be set by a Committee consisting of the President, the Treasurer and the Secretary, and that recommendation be made to the Board of Trustees that from the date of retirement she receive, as long as she lives, a salary at the rate of \$3,000 per annum.

* * *

The Executive Committee *recommends* that the House make permanent this action of the Executive Committee.

applicant for membership in the Medical Society of the State of New York as soon as the Secretary of the County Society advises the Secretary of the State Society that his application for membership, together with his check for dues has been received and placed on file with the County Society, provided that when the applicant is finally elected the binder is to be closed by the issuance of a certificate of insurance dated as of the date of issue of the binder, provided that if the applicant fails of election the binder will be cancelled as of the date of the issuance of the application, and the applicant would enjoy no protection thereunder

Journal Management Committee

Expansion of both publications—the NEW YORK STATE JOURNAL OF MEDICINE and the Medical Directory of New York, New Jersey, and Connecticut—was achieved in 1936

THE JOURNAL

The page content for the last three years has been as follows

	1934	1935	1936
Total text	1104	1296	2036
Advertising	554	757	1076

On October 1, 1936, a magazine size of 160 pages became possible. Not only has more scientific material been published, but more news about various subjects relating to the practice of medicine, public health, Society activities, medical economics, comment in the section "Across the Desk," medical news from counties, book reviews, medicolegal comment, and recently there has been added a new section on "Hospital News." It is planned to record events in the field of maternal and child welfare as time goes on. It is hoped eventually that the magazine may reach a size of 192 pages and cover

Last November the Secretary, with Dr Kopetzky representing the Editorial Board, attended the Annual Meeting held by the American Medical Association of State Society Secretaries and Editors, and they were accompanied by Thomas R Gardiner, Business Manager of the JOURNAL, William Seaver Woods, writer for the JOURNAL, and Dwight Anderson

of the Bureau of Public Relations of the State Society. The group was welcomed at the headquarters of the American Medical Association in Chicago by Dr West and Dr Fishbein, and was conducted through the plant—particularly the editorial and printing offices. This experience led to formulation of plans that will contribute, it is thought, to further improvements in the JOURNAL.

In the field of scientific writings the JOURNAL seeks original material concerning all phases of medicine, scientific and clinical, for attention of both general practitioners and specialists of all kinds. In 1936 there were submitted 368 scientific articles of which 211 were selected to fill space available.

The cost of production to the Society remained in 1936 below the budgetary \$1.00 per member. In 1934 it was 70 cents per member, in 1935 it was 90 cents, and it rose in 1936 slightly to 95 cents. This increase is trifling when it is compared with the enlargement of the JOURNAL.

The members of the Committee find the work of supervision of steadily increasing interest and wish to extend their thanks to the membership for the growing attention that the magazine is receiving. It is gratifying to be able to report that references to editorials and other text by other medical journals are more and more frequent.

THE DIRECTORY

The Committee was able to arrange with the State Societies of New Jersey and Connecticut to provide full data about their members along the same lines as appear for physicians in New York State. The two other Societies have done this at their own expense, and the Committee extends its sincere thanks to Dr LeRoy A Wilkes, Executive Secretary of the Medical Society of New Jersey, and to Dr Creighton Barker, Administrative Secretary of the Connecticut State Medical Society. The book has been made with their help far more valuable to everyone.

There have been, for the physicians in New York State, designations devised which indicate general and special qualifications for each physician listed under

the general financial condition of the country more or less uncertain and future returns from the sources of our income possibly affected by changing conditions, it remains essential to conserve to the highest degree the principal of your assets. This may demand for the time being larger cash holdings without attempting investments at higher but more doubtful interest returns. Possibly lower returns must therefore be compensated by a carefully prepared budget and adherence to its allotments. An additional and extraordinary item of expense during the present year, which will increase annually, is the payment of Social Security

taxes for the unemployed and for the employees of your Society.

Your Treasurer desires to express his obligations to the Board of Trustees for their faithful supervision of the Society's funds and constant cooperation, likewise to the certified accountants, Messrs Wolf & Company, whose annual statement is attached to this report, as well as to Miss Baldwin and the office staff for their efficient handling of the details of his office.

Respectfully submitted,

GEORGE W KOSMAK, *Treasurer*

April 1, 1937

REPORT OF BOARD OF TRUSTEES

To The House of Delegates, Gentlemen

During the course of the year following the last previous meeting of the House your Board has carried out the duties imposed upon it by the Constitution and By-Laws. The manner in which they have been performed and the results of their policies as regards the investments of the Society will be adequately shown in the report of the Treasurer and need not be duplicated here.

There is no need to inform the House concerning the period of financial uncertainty through which this country—and indeed the whole world—is passing, it is mentioned merely as a foreword to some of the statements which follow. In relation to investments the most serious consideration must be given to the recent rapid change in the governmental attitude to the status of private ownership of property, the condition of its own budget with the resultant threat of, if not actually the presence of inflation, the inevitable effect of these policies on investments and finally the credit situation due to the government's continuing policy of large borrowings upon its own securities which are held in the main by the banks of the country, which bonds constitute a large if not a major part of the banking reserves. For these reasons especially, the task of investment and re-investment of funds accruing to the Society has been an onerous and difficult one, and for the present at least, your Board believing that their most important function is the

protection of the safety of the principal of the Society, has deposited in a number of savings banks at a low rate of interest in the neighborhood of twenty per cent of its total investment funds. The remainder in accordance with the will of the House has been invested in bonds and mortgages and not to exceed twenty-five per cent of the total in corporate stocks. As may be noted from the Treasurer's report some of the earlier bond purchases are in default and have been so from the early or later years of the depression, fortunately these bonds are in small amounts and some of them will probably be redeemed. At any rate the total loss to the Society if none are redeemed will not exceed six or seven per cent of the amount invested prior to 1929. The investment in industrial securities authorized last year has already shown a satisfactory increment both in value and dividends.

The expenditures of the Society have increased in the neighborhood of thirty per cent in the past eight years, its normal income from dues and other sources not including investments has increased a little less than ten per cent. Until this year we have lived within our income, it is quite doubtful that we will maintain that record, and unless it be maintained by careful limitation of expenditures proportioned to their actual value to the Society, by the Executive Committee and the Council whose duty it is, subordinate to the orders of the House, to adopt and approve policies in-

Conferences with State Hospital Association

Present hospital customs having been the subject of much study by the Committee on Economics and consideration by the Executive Committee, it was deemed wise to enter in conference with the State Hospital Association on such matters as affect both hospital and physician. For this purpose the following Committee was appointed

For the State Society

Floyd S Winslow, <i>Chairman</i>	Rochester
Frederic E Elliott	Brooklyn
Thomas P Farmer	Syracuse
William A Groat	Syracuse
Augustus J Hambrook	Troy
Leo F Simpson	Rochester
Homer L Nelms	Albany
David J Kaliski	New York
Peter Irving—(<i>ex-officio</i>)	New York

For the State Hospital Association

Frederick MacCurdy, Supt. Vanderbilt Clinic	New York
---	----------

Sigmund S Goldwater, Commissioner Department of Hospitals	New York
Basil C MacLean, Director Strong Memorial Hospital	Rochester
John H Hayes, Supt. Lenox Hill Hospital	New York
P G Savage, Supt. Niagara Falls Memorial Hospital	Niagara Falls
Carl P Wright, Supt. General Hospital of Syracuse	Syracuse
Ernest McKay, Supt. Arnot-Ogden Memorial Hospital	Elmira
James U Norris, Supt. Woman's Hospital	New York
Mabel Davies, Supt. Beekman Street Hospital	New York

Two conferences have been successfully held and progress made in phrasing advice in various matters for presentation to both organizations when completed.

Respectfully submitted,

PETER IRVING, *Secretary*

April 1, 1937

REPORT OF THE TREASURER

To the House of Delegates, Gentlemen

In accordance with the provisions of the By-laws, there is presented to you herewith the report of the Treasurer of your Society for the current year as well as the auditor's statement for the twelve months ending December 31, 1936. The details of this carefully prepared statement should be given earnest consideration by the members of the Society. Attention may be called to the following items. The income of the Society is based on dues and interest payments. The former show an increase during 1936 of \$3,373. The income from invested funds was \$9,679.66, in comparison with a similar item of \$3,075.75 in 1935.

The security holdings of your Society have undergone considerable change during the past year owing to the necessity for reinvesting the proceeds from the bonds called for redemption. Of the latter proceeds, some \$33,000 have been placed in savings banks for lack of suitable investment opportunities and about

\$50,000 have been used for the purchase of high grade preferred and common stocks. Bonds of a par value of \$23,000 have defaulted in interest since 1932 but none since December 1, 1935. The total interest lost up to December 31, 1936, is \$4,220 but the bonds themselves have a market value.

For the purpose of simplification, the various fund divisions in previous balance sheets have been eliminated and have been consolidated with the General Fund which, with other current assets, constitutes a grand total of \$266,792.48. While the stocks purchased during the year show an increase of \$1,910, the bond holdings disclose a gross depreciation of \$3,614.87 when comparing costs with market values as of December 31, 1936. This net depreciation of \$1,714 (omitting cents) may be compared with a similar figure of \$10,440 as of December 31, 1936, and indicates an increase in market value during this period of \$8,725.

The status of your Society's treasury may be termed as satisfactory but with

izing their work in refraction only. It cannot discriminate against the optometrists in refraction work. Where disease conditions exist, however, it is a matter for the medical specialist, and we feel that a change in the law is advisable by the amendment that any child whose central visual acuity cannot be corrected better than 20/30 by lenses, be referred to his physician for examination and treatment. We feel this is sound in principle, and recommend its adoption.

Formation of Community Health Relations Councils. This was recommended by the House of Delegates for study, and after extensive investigation by the members of the Committee, it was found that in many counties of the state coordination of health activities was in the hands of a council of Social Agencies, and through its division on health, the medical work, both preventive and curative, was undertaken with the consent and approval of the County Medical Society. It is the opinion of the Committee that leadership in all health activities should be in the County Medical Society, that it is a matter that rightfully belongs to the Public Relations Committee of each County Medical Society, and where no such coordination is now in effect that it is strongly suggested for local consideration.

Joint Meeting of Legal and Medical Professions by County Associates Once a Year. This was recommended by the House for study. The Committee is in entire accord with the idea that agreeable contacts be made with members of the legal profession in each county. It has suggested that at least one meeting a year be held to which members of the legal profession are invited to attend and to discuss problems of mutual interest to both the medical and legal professions. In this way, a better understanding of the problems of the medical profession will undoubtedly be engendered in the minds of our associates in the legal profession. Many of the County Medical Societies have held such meetings for several years, and have found them not only of friendly interest, but productive of much better understanding. We recommend each County Society to arrange for at least one meeting each year with

the members of the legal profession in that county.

Relationship Between Grievance Committee, Legal Department of the State Medical Society, and Public Relations Committee. This matter was referred by the House of Delegates and applies principally to malpractice cases and the need for classified material, most usual causes for malpractice actions, and the dissemination of such information to the members of the Medical Societies of the State for their guidance and information. The Committee, after considering this very thoroughly, recommended to the Executive Committee the data be assembled with the assistance of the Grievance Committee and the legal division of the Medical Society, and that after approval, it be collated, printed, and sent to members of the State Medical Society. Because of the extreme difficulty in obtaining accurate information on this all-important matter, and having to depend on records of insurance companies, briefs in the Grievance Committee and in the legal department it has proven a very difficult assignment. To be right and informative, it must be thoroughly done, and your Committee feels that further time will be required for actual statistical figures.

Examination of School Children. This matter was referred by the House of Delegates, and was the result of a recommendation that a special committee be appointed to investigate the entire matter of school inspection and in particular to determine whether health matters in the school would be best served by remaining in the Department of Education or whether they should be transferred to the Department of Health. Within the Department of Education, there is a health and physical education division. Under it, some 1,500 school physicians undertake to care for over one million school children. The section on medical inspection is in charge of a physician. The section on physical education has as its function the teaching of dances, games, drills, athletics, and other body-building activities. We recognize the great importance of these latter activities for growing and developing children, but feel that the thorough physical examination either by the school doctor or the family

volving the expenditure of funds and recommend to the Board of Trustees such expenditure, your Board feels that a serious danger threatens. Most of these expenditures have been extra-budgetary and have been in the main due to Committees either exceeding the appropriation made in the budget or demanding an increase over that appropriated because of a presumed emergency. In a large part this has been due to the necessarily hasty preparation of the budget between the end of each annual meeting and the last week in June in order to render funds available to the incoming administration with the beginning of the fiscal year. To avoid this contingency your Board has recommended to the Executive Committee that a tentative budget which will require only minor changes be prepared for submission to the Board of Trustees in April of each year so that a more careful study can be made of the needs and propriety of the expenditures recommended. Your Board believes that the Society can maintain its efficiency and perhaps add to it as well as live within its ordinary income by a more careful scrutiny of the value either actual or potential it derives from certain of its ex-

penditures, not alone to itself as a corporate body of the whole profession but also to its individual members, for whose benefit and that of the public, in the end, lies the sole reason for its existence.

With one exception we refrain from making recommendations to accompany this report, the power does not rest with us. It rests in the House and its derivatives the Council and the Executive Committee to whom we have from time to time made recommendations concerning the matter discussed in this report, the exception we recommend is that

The House of Delegates direct that the Society maintain its expenditures within its ordinary income exclusive of the principal or income from its investments and that this policy be not departed from except by resolution of the House either in regular or special meeting assembled or by referendum vote.

Respectfully submitted,

JAMES F. ROONEY, *Chairman*

REPORT OF THE COMMITTEE ON PUBLIC RELATIONS

To the House of Delegates, Gentlemen

The Committee on Public Relations has met monthly during the present fiscal year in an endeavor to properly plan its activities and to care for the various matter brought to it for consideration and adjustment. All members of the Committee have given liberally of their time and effort, and have shown marked enthusiasm in developing the various plans and policies of the Committee. Its sole endeavor has been at all times to place organized medicine in the position of leadership in all matters pertaining to the health of the people of this state. The work of the Committee consists of the regular monthly meetings, conferences with other state committees and groups, specific detailed work for sub-committees, and this year for the first time the Chairman meeting with the Executive Committee monthly at New

York. This latter, I believe, has brought about a better understanding of the problems confronting the Medical Society in the state, it has made for more cooperation between committees, and has prevented duplication of efforts. I think the President should be commended for bringing about this better adjustment of Committee activities.

At the last meeting of the House of Delegates, several matters were referred to the Public Relations Committee.

Care of Children with Defective Eye Sight It would appear, after a careful study on the part of your Committee, that this matter was referred because of objections made on the floor of the House of Delegates to the Reference Committee's report. Optometrists are recognized by the regents of the State of New York, and are licensed after an examination, and given certificates legal-

under this law. The Executive Committee of the Medical Society empowered the Public Relations Committee to continue its good offices in the proper working out of the Crippled Children's Act. An opinion by the Attorney General of the State of New York allows that the Children's Court Act may be construed to include children who are partially deaf on the ground that such a child may be regarded as a physically handicapped child, and may receive the benefits which the state requires to be given to such afflicted children. The Revision Subcommittee has not completed its work. We realize some changes are required to bring it up to date. Some operations are unpopular or not generally used at the present time, and some new ones should be added. Meetings with the State Health and Educational Departments and the Subcommittee are being held. Harmonious relations exist between the Departments and the State Medical Society, and satisfactory agreements are anticipated.

License for Psychologists. The President referred to the Public Relations Committee proposed legislation to license properly trained psychologists as certified psychologists, and on invitation of this Committee several outstanding representatives of the Association were invited to present their claims for licensure. It was brought out they were desirous of securing the good will and friendship of other groups who might be interested, particularly the medical group, before approaching the legislature. The organization has 297 highly trained and experienced members of whom 187 are residents of New York State. Many undertrained, inexperienced individuals are practicing and set themselves up as psychologists. The public has no way of distinguishing between the real and the imitation or untrained and deserves protection. Most of their activities are in schools, hospitals, clinics, and institutions, particularly child guidance clinics. At a later meeting were present by invitation Commissioner Parsons of the Mental Hygiene Department of the State of New York, Dr Israel Strauss, and Dr Lloyd Ziegler—both members of the National Board of Neurologists and Psychiatrists. It was felt by the medical men present

that the proposed bill would encroach upon the Medical Practice Act. After careful study by the members and reviewing the opinions of those present, it was voted not to recommend the bill, and was so accepted by the Executive Committee.

Reports on Patients in State Institutions. It was brought to the attention of the Committee that frequently patients being treated at the State Institute for the Study of Malignant Diseases, Mental Hygiene Hospitals, and in State Tuberculosis Hospitals are sent home and receive little or no care because the physician is unaware of their return, and is not notified by the family. After conferences with Department heads, the Public Relations Committee offered to its Executive Committee the suggestion that for the better and continued care of patients in these state institutions, notice of discharge or parole be given to the family physician or the committing examiners. This will insure continued and correct care for the patient.

Proposed Revision of Rules of the State Welfare Governing Dispensaries. The Public Relations Committee was asked by the State Welfare Department to review proposed new rules governing dispensaries. After thorough discussion, several matters were brought up. The present rules governing the admission of the patient to a dispensary are not stringent enough. The patients need only to be recognized by the person in charge of the dispensary to be admitted. Many times, this admitting person is not competent and it was generally agreed that some principal officer with experience should be in charge of a dispensary. The present law does not permit the entrance of veterans as dispensary patients, but this is not clearly understood, and the following rules governing veterans and their families are for the guidance of all. A veteran according to State Law is not classed as an indigent, and to quote from Public Welfare Law, Art. 14, Sec 117, in part, "Such person when in need of relief and care shall be eligible for Veteran relief, and shall be given relief and care in their home, or if it is not practicable to care for such persons in their own home, they may be committed to a soldiers' home or institution or to

physician is infinitely more important. A new program and bulletin on the administration of school health service has been reviewed by the Public Relations Committee. Many suggestions were made regarding the new bulletin, all, we feel, in the interest of the school child. It is our opinion that more careful and complete physical examinations be made, and as many as possible by the family physician. In this way, physical defects will be found, more corrections made, the child will be enabled to use his school years more fruitfully, and less failures in school grades will occur. It is not always possible or practical for the school child to be examined by the family physician, and in many such instances regularly employed school physicians are doing the work thoroughly and conscientiously and with very satisfactory cooperation from school officials. It is to be hoped that proper and adequate facilities will be furnished for making these examinations in the schools. Many physical defects found will be corrected by cooperation between the physician and parent. The active cooperation of all interested in the welfare of the child is necessary to obtain the best results.

Studies Regarding Hospitals Interns
This was up for study last year, and we found that some hospitals carried men as interns for three and four years, thus preventing many young physicians from taking advantage of this very valuable form of postgraduate education. To quote Dr. Warren, past Chairman of this Committee: "In Massachusetts under the law, graduates of certain schools are licensed but cannot be interns in that state, and that is why they are over here where they can be interns but cannot be licensed."

The studies this committee made of the licensing of foreign graduates in medicine showed they were made up of three groups

- 1 Physicians educated in their native lands who come here and are admitted to the regular medical licensing examinations
- 2 Native foreign physicians who have been in practice for a certain number of years and come here and apply for licenses without any examination
- 3 American students who go to foreign countries for medical education, are licensed

in foreign countries and then return to this country to practice their profession.

The percentage of failures of the first group is very large or about thirty-five per cent.

Regarding the second group, we are informed that after the fifteenth of October, 1936, all have had to take an examination before a license is issued to practice medicine in this State.

Those in the third group are very small in number and rapidly falling off. This speaks well for our American Colleges of Medicine. Our main objection was against the second group and the decree of the Board of Regents has settled the disputed matter.

Physically Handicapped Children's Act
The Public Relations Committee has under consideration a revision of the compensation features of this law because of two important objections: *first*, the lack of uniformity of handling cases in many counties, and *second*, the inappropriateness of the schedule. About eight years ago, the Public Relations Committee was asked by the State Health and Educational Departments to set up a state-wide fee schedule as a guide to the county judges or judges of the children's courts for medical care under the Crippled Children's Law. After exhaustive study, the following principles were established: *first*, that physician should be compensated for the care of the indigent child under the Crippled Children's Law, *second*, that it is the duty of the state to determine who are permitted to receive state care, *third*, that it is recognized that professional work will be done on a minimum basis for care of the indigent, handicapped child, and *fourth*, since no two cases of sickness or injury are alike, fees may only be arranged for immediate conditions, and future compensation must be based on the time and effort expended by the physician. The schedule as arranged was intended as a guide rather than a fee regulation so as to promote a more harmonious administration of the Crippled Children's Act and yet protect the physicians of the state in doing work under this law. It was never adopted by the House of Delegates, and has been used as a guide by the state departments of Health and Education in approval of state aid for medical and surgical care.

Committee, has directed considerable attention to community control and early diagnosis of cancer. The program as outlined by the State Charities Aid Association had no reference to organized medicine, and was discontinued because of opposition of different cancer societies. Regarding the bill introduced in the legislature for the erection of three new state hospitals for the care of cancer, it was the opinion of members of the Committee that while this is a matter particularly for the Health Committee, it had a direct bearing on all members of the medical profession in the state. The Committee felt that the cancer problem is a grave one in this state, that there is extreme lack of coordination on the part of the different agencies working in the cancer field, but with a state budget of 365 millions this year, it did not seem wise or advisable to build three state hospitals for cancer patients when present hospitals could be utilized for their care. A subcommittee was appointed to study this bill, and later were invited by the Health Commissioner to attend a meeting at Albany. Present at the meeting were the Health Commissioner, Dr. Simpson, Director of the Buffalo Institute, Drs. Farmer and Mitchell of the Health Committee, and Drs. Cunningham and Hambrook of the Public Relations Committee. The bill was studied in detail, and some plans were discussed whereby state cancer clinics might be formed in different parts of the state providing, if necessary, radium and x-ray equipment. It was suggested that the cancer institute might be used for postgraduate instruction. This plan would save expensive duplication of hospital facilities. The family doctor would be utilized as he should be in the early diagnosis of cancer cases, and the patient would not have to travel long distances to hospitals for treatment. A commission was suggested to supervise the carrying out of details.

We wish to express to our Executive Officer, Dr. Joseph S. Lawrence, our sincere appreciation for his untiring efforts on behalf of the Committee, and his help and advice on many of the problems discussed by the Committee. To our President, Dr. Floyd S. Winslow and our Secretary, Dr. Peter Irving, we are indebted for wise counsel and advice. The

Subcommittee on the Deaf and Hard of Hearing wishes to express its sincere appreciation to Miss Estelle E. Samuelson whose loyalty and devotion to the work of this Subcommittee has made possible marked improvement in the care of the Deaf and Hard-of-Hearing children. To the chairman of the other standing committees, who have been most cooperative and helpful, the Committee desires to extend its gratitude and appreciation. Finally, the Chairman wishes to express his personal appreciation for the splendid cooperation and untiring effort on the part of each member of the Public Relations Committee. They have been loyal, worked diligently, and have aided in the constructive work of the Public Relations Committee.

Respectfully submitted,

A. J. HAMBROOK, *Chairman*
WILLIAM H. ROSS,
HERBERT H. BACKUS,
ARTHUR F. HEYL,

FREDERIC W. HOLCOMB,
THOMAS H. CUNNINGHAM

April 1, 1937

In Memoriam

The Public Relations Committee of the Medical Society of the State of New York wishes to express its profound sympathy on the death of Dr. Luther Fiske Warren who died in Brooklyn, January 18, 1937. Dr. Warren was the immediate past chairman of the Public Relations Committee, and gave unsparingly of his time and talents to further better relations between the Medical Society and other organizations working in the field of preventive and curative medicine. A former president of the Medical Society of Kings County, he was physician in chief of the Long Island College Hospital and St. John's Hospital, medical director of the Brooklyn Home for Consumptives, and consulting physician at Methodist Episcopal Hospital, Coney Island Hospital, Harbor Hospital, Brunswick General Hospital, and Lutheran Hospital. He was professor of Medicine at Long Island College of Medicine and Chairman of the Board of Medical Ex-

another home or hospital, but no Veteran eligible for relief shall be committed to a public home as defined in this chapter." This has been interpreted to include dispensaries. Patients requesting care in dispensaries or clinics are governed by Sec 296, Chap 55 of the Consolidated State Laws which provide that "Any person who obtains medical or surgical treatment on false representations from any dispensary licensed under the provisions of this article shall be guilty of a misdemeanor, and on conviction thereof shall be punished by a fine of not less than ten dollars and not more than two hundred fifty dollars." Imprisonment until fine be paid may be imposed. No specific cases are known where such has been enforced. It was also suggested by the Committee that the card given to each patient at the first visit should include not only a copy of this law, but also have the signature of the patient on it. Some other minor changes in the rules were suggested, and we feel that with a careful investigation of each case and carrying out the provisions as outlined, many will be prevented from seeking free care at dispensaries or clinics who are able to pay a private doctor for similar services.

Care of the Deaf and Hard of Hearing
The Subcommittee on the Deaf and Hard of Hearing has carried on its work to provide better care for these crippled children. Dr Hambrook representing the Public Relations Committee is Chairman, Dr Leo F Schiff is the other member representing the Public Health Committee. Miss Estelle E Samuelson has been secretary for the four years this Subcommittee has been active. Many problems concerning the Deaf and Hard of Hearing have been studied by this Subcommittee. During the past year, two laws were passed and signed by the Governor which provide for the annual examination of the hearing of all children by scientific methods and under supervision of the State Department of Education. Another law provides an amendment to the health laws of the state requiring the reporting of all Deaf or Hard-of-Hearing children by parent, guardian, teacher, physician, or other interested party to the health officer of the city, town, or village. Suitable instruc-

tion is given by said officer for the proper care of the crippled child. Legislation is being asked this year to provide for lip-reading instruction in the regular schools for children who need this additional aid in order to keep up with their grades, and special classes in the regular schools for children with hearing losses too great to profit by grade instruction unless aided by lip reading, hearing aids, and voice and speech training. The Governor has been petitioned to appoint a commission to study the care of the Deaf and Hard of Hearing and to coordinate and make more active present laws and to formulate such necessary legislation as may seem wise and practicable.

Motor Vehicle Accidents and What the Medical Profession can do to Improve Existing Conditions
Mr T J Fox of the State Motor Vehicle Department was present on invitation to discuss increasing number of deaths caused by motor accidents, and to obtain the advice and opinion of the Medical Society as to how they could cooperate. Some 3,600,000 drivers are licensed yearly in the State of New York. A very cursory physical examination is required. It is generally understood that a relatively large percentage of accidents is caused by a small percentage of drivers. They are the persistently careless or incapable, and are a menace to normally minded individuals. A classification of physical conditions sufficient to exclude from licensure was suggested. It naturally included severe types of blindness, or deaf or hard of hearing, mental conditions, such as, morons, some types of heart disease, and extreme nervousness. More practical eye tests are necessary. No accurate hearing tests are required. Color blindness is often times overlooked. Many accidents are due to the fact that the driver is unable to think and act quickly. A complete physical examination would require additional fees, and might prevent some from obtaining a license.

Legislation to Care for Cancer Patients
In September of the present fiscal year a proposed program for cancer as outlined by the State Charities Aid Association was discussed by the Public Relations Committee. The State Medical Society, through its Public Health

(b) The relations between the Society and the official agencies of Public Health and Social Welfare grow more cordial and cooperative. This condition is fundamental to the development of (a)

(c) We continue to observe the operation of such experiments as the Medical Economic Security Administration for the District of Columbia, at Washington, and the Medical Service Bureau of the Wayne County Medical Society, Detroit, Mich. They are proving their value for the solution of certain factors of the problem

(d) There is also evidence of an increasing number of patients who meet their medical care expenses thru "financed credit" and periodic budgeted payments to banks (The full development of the ideas (c and d) awaits "law revision" (a) to make full accomplishments possible and practicable.)

(e) Voluntary Insurance The Committee has prepared a proposed amendment to the Insurance Law. A similar amendment passed the Assembly and failed in the Senate last year (1936). The Committee has circulated "A Comparison of Compulsory Health Insurance and Medical Expense Indemnity Insurance" which sets forth the general idea of medical expense indemnity insurance and its application to the problem before us. Specific recommendations on this subject have been laid before the Executive Committee

(f) We have not had the time to devote to discussion with proper authorities the proposal of substituting "national health saving" for "Christmas Club Saving." We believe that such change can be accomplished.

4 It is gratifying to observe a trend of retreat by the Foundations from the activities in the propagandizing of undesirable types of "organized medical care"

5 The hazards of a politically controlled "compulsory health insurance system" still hang in the clouds which overcast the future. We hold to the hope that true statesmanship in high places will see the light and not plunge this country's medical service into general demoralization

6 The consideration of the deteriorating influence of institutionalism upon the field of private practice is now in the hands of a special committee. We feel there should be no change in the attitude of organized medicine on this question

7 The Committee finds great satisfac-

tion in the cooperative cordial relations with the United States Employees' Compensation Commission relative to the care of injured workmen. A broad-minded interpretation of their rules and regulations made this field of opportunity open to the profession of our State under terms practically identical to our State Workmen's Compensation Law and to those who have enrolled upon the various County Medical Society lists. This relation became operative early in 1936 for the State except the five metropolitan counties. Within the past two months arrangements have been made to extend this relationship to the entire state. We acknowledge with due appreciation the personal, cordial cooperation of Dr. Paul Stewart, Medical Director of the United States Employees' Compensation Commission at Washington, D C, Mr. C. M. Whipple, State Compensation Officer of Works Progress Administration of New York State, at Albany, and Mr. John F. Overend, State Compensation Officer of U. S. Works Progress Administration for the City of New York. No instance has been brought to our attention where any physician has been unjustly treated, and we are happy to report that in every case where a question has arisen between any physician and this public agency, the settlement has been prompt and satisfactory.

8 This Committee, by instruction of the Executive Committee, considered "Proposition No. 3" of the Booth Committee report. Our recommendations and the action of the Executive Committee thereon will be found in the *NEW YORK STATE JOURNAL OF MEDICINE*, January 1, 1937, page 75. We report here, that, to the best of our knowledge, none of the "hospital insurance" associations have corrected their methods and contracts to conform to this re-statement of Medical Society opinion.

9 By instruction of the Executive Committee, this Committee considered the question of "group practice" by physicians of our Society. Our recommendations to the Executive Committee thereon are herewith quoted: "That it be the expressed opinion of the Medical Society of the State of New York that groups of physicians, practicing as such, should

aminers of the Regents of New York State. He was intensely devoted to his work and to his family. He was a great man not only in his professional career as a physician, but in all the activities of his busy and useful life. By those who knew him best through years of in-

timate association, he was classed as a man of extraordinary brain power and strength of character. His death is a great loss to his family, to the city in which he lived, to the institutions he served so faithfully, and to the Medical Society of the State of New York.

REPORT OF COMMITTEE ON ECONOMICS

To the House of Delegates, Gentlemen

1 The principal feature of our program for the past year has been the effort to carry the active discussion of matters of economic import to the local County Medical Society meetings. This Committee has reached the conclusion that the economic salvation of the profession of medicine will rest upon one of two conditions. Either the whole of the profession must become familiar with medical economics and thus make a general concurrence of opinion possible, or, there must be a delegation of authority to and confidence in a small group which shall have the power to handle our economic relations with other social and organized groups. The following points have contributed to this opinion:

(a) The continued extension of the dole of free medical care to persons and families who are capable of self-reliance is unsound social economy.

(b) The creation of revenues for the financial support of hospitals thru charges for physicians' donated services is inimical to the public welfare.

(c) Medical care has a cost which must be met. Something cannot be created from nothing. Knowledge, training, and experience are not acquired without a cost in money, time, and effort. During the past half century medical standards of education, training, and practice have been increased and consequently costs have been multiplied and must be met. In spite of these difficulties the profession of America has met its obligations.

(d) The vital statistics of our State and Nation demonstrate the abatement of all major causes of death in the young and middle aged groups and our population statistics show an ever-increasing ratio of persons who are in the advanced age group. These mute figures constitute proof of the contribution of the medical profession to American life.

(e) Our profession cannot close its eyes to the fact that our socio-economic environment is changing. Vocationally the people whom we serve are becoming less agricultural, less individualistic, and more industrial and more mutually dependent and regimented. Individually and collectively we must adjust ourselves to these changes. And these adjustments must be made in such fashion that the past achievements will be retained and the progress of our service assured.

(f) The problem is to find a way to retain the quality of medical care and to pay the cost of it. And no solution of the problem can be worked out until and unless all official and other "survey" and "study" boards and committees are staffed with members of the medical profession, proportional to their knowledge, understanding, and interest in the scientific and economic aspects of medical care.

(g) Because of the trends cited above, the financial support of the medical profession has devolved progressively upon a smaller portion of the people, while the burden of such support has continuously increased.

2 In the report of this Committee on Economics for 1935 (NEW YORK STATE JOURNAL OF MEDICINE, April 15, 1935, page 357, section 4) we discussed the development of a program for the solution of this very complex problem. By instruction of the House of Delegates (NEW YORK STATE JOURNAL OF MEDICINE, June 15, 1936, page 953, item 84) we have continued the study of the development of the program outlined.

3 *The Program*

(a) The project of law revision in New York State is essential to a complete correction of wrongs and solution of the problem of maintenance of quality of medical care and proper financial support thereof. Informal discussions have been continued with satisfactory encouragement but the time has not been right for pressing this issue to legislative action.

REPORT OF COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

To the House of Delegates Gentlemen

Your Committee on Public Health and Medical Education begs leave to submit the following report for the current year, 1936-37

In the files of the Committee are the annual reports for the last seventeen years, excepting that of 1925. A perusal of these reports shows that the Committee on Public Health and Medical Education has made definite progress each year. Important activities at present include (a) the initiation of health activities, (b) cooperation with county societies in expanding health programs, (c) cooperation with governmental and other health groups, (d) improvement of medical practice through postgraduate education.

Graduate Education

As has been frequently mentioned in former reports, graduate education of the practicing physician constitutes the greatest single contribution which the medical profession can make to public health. Postgraduate education is a necessary activity in public health work, and it has received special emphasis in the Committee's work this year.

The following is a report of the graduate courses which either have been given, or will be given by the State Society for county medical societies during the current year.

* Cayuga	Internal medicine
Cattaraugus	Obstetrics
Chemung	Syphilis
Clinton	Internal Medicine
Columbia	Subject not determined
Franklin	"
Greene	"
Jefferson	Obstetrics
Madison	Subject not determined
* Monroe	Internal Medicine
* Rockland	Obstetrics
St. Lawrence	Subject not determined
Steuben	"
Sullivan	Orthopedics
Tioga	Internal Medicine
* Wayne	Internal Medicine

* Course has been completed

Owing to the early date at which time this report must be submitted, no detailed report can be given on these courses. Many of the courses will not start until shortly before the time of the State Society meeting, and it is probable that others will be arranged which will not be completed until after the annual meeting. There are no features regarding the Committee's program of graduate education for the current year which require particular comment. The list of courses available to county medical societies has been revised somewhat, some of the older courses being eliminated, others changed, and new courses added. It should be noted that most of the county societies continue from year to year to have courses. It can readily be seen from this statement that graduate education is a prominent feature of the work of these societies. The courses have been universally well-received and the work has progressed harmoniously. There has been excellent cooperation on the part of the county medical societies, and the lecturers have been most capable and kind in their willingness to serve.

Public Health

It has already been emphasized that the Committee is interested in expanding present activities and initiating new ones in public health work. This attitude has been praised by governmental health officials. The Committee has received assurances from county medical societies that its efforts and harmonious cooperation with other health groups have been approved.

The Committee has centered its major attention on the problems of Pneumonia, Maternal Welfare, Child Hygiene, Cancer, and Syphilis. As in the past, sub-committees have been created within the Committee for each of these subjects, excepting Syphilis Control. The personnel of these sub-committees has continued largely the same, with the principal exception of the sub-committee on Child Hygiene, where Dr. Edward J. Wynkoop, a new member of the Committee,

remain within the same framework of restrictions as to their conduct as though the activity were that of an individual physician. In other words, we feel that a group may not obtain publicity, by any means, in lay publications, that it should not solicit or advertise, that it should not claim superior quality of service and it should not practice competitive fees against the individual physicians of the community. If the group conforms to this and relies solely upon the recognition of its service by the people of the community as its sole means of acquisition of patronage it would seem to be a proper and fair activity. On the other hand, if the group by subterfuge courts the patronage of the community by enjoying any form of publicity, it would seem to us that each member physician should be considered personally guilty of misconduct." This expression of ethical principles was adopted by the Executive Committee at its meeting, January 14, 1937.

10 We now recommend that such statement of principle be adopted by the House of Delegates and that it be extended to apply to all hospitals and other institutions where medical treatment and/or diagnosis is rendered.

11 In compliance with the expressed and implied instructions of the House of Delegates, and responsible officials of the Society, this Committee has refrained, during the past year, from issuing periodic bulletins, etc., to the officers and committees of the County Medical Societies.

12 The Committee has wholeheartedly cooperated with the administrative officers in the promotion of their objectives. We now have in preparation a review of the past six years of work by this Committee. When this manuscript is properly assembled and indexed it will be submitted to the administrative office of the State Medical Society.

13 We conclude this report with an unqualified endorsement of the report of the special committee on revision of Constitution and By-Laws. The need of revision of the administrative machinery of the Society has been outstandingly evident to this Committee since its first meeting in 1931. At that time we were without guidance as to scope and range

of our proper activities, and without reasonable cooperative contact with other committees of the Society. Group concerns cannot be successfully and fully served by segregated autonomous committees independently engaged. There must be greater unity of thought and action.

14 The organized medical profession cannot retain its place in the present changing social environment without some adjustment of its administrative machinery to present conditions. Granted, for the sake of argument, that some details have not been thought through to perfection, we still feel that the recommendations of the Special Committee on Revision of the Constitution and By-Laws could well be adopted without essential change. This would represent such a definite improvement over the present structure of administration. Experience may well be the guide to the further development or correction of details. We believe that the "balances and checks" have been well designed. Under the plan proposed, we are sure that our collective or group interests will be served better than ever before. We urge support of the recommendations of Dr. Mitchell's special committee.

15 Again, we acknowledge with sincere thanks, the receipt of great encouragement and help from our friends in neighboring states who have provided this Committee with their bulletins, publications, and personal letters of comment on economic matters.

16 We conclude with sincere thanks to the officers and members of the other committees of the Society whose friendly cooperation we have enjoyed.

Respectfully submitted,

FREDERIC E. ELLIOTT, *Chairman*
 CHESTER O. DAVISON

April 1, 1937

monia Control of the State Department of Health calls for particular acknowledgment. Summing up the Committee's activities in the field of pneumonia control, it is apparent that the greatest need from the standpoint of the State Medical Society at the present time is the participation in this work of active public health committees in county medical societies.

Maternal welfare Twenty-nine county medical societies have appointed maternal welfare committees. While this represents only about half of the county medical societies, and only a small increase over the number as reported last year, nevertheless there has been a decided increase in the effectiveness of the committees of some county societies which should prove stimulating to other county societies. Maternal mortality studies have been made in Erie, Monroe, and Westchester Counties, and a similar study is being made in Onondaga County. Reports of the studies in Erie and Monroe Counties have been published in their respective bulletins. Postgraduate courses in Obstetrics have been given in Cattaraugus, Jefferson, Rockland and Onondaga Counties. The latter course was sponsored by the local county society. In order to hasten the organization of maternal welfare committees in all county societies, and to make them active a group of obstetricians have been asked to act as advisors to the Committee and aid in the organization of this work in their districts. This group has met once with the sub-committee on Maternal Welfare. As a suggested program for county medical societies, the State Committee is prepared to offer postgraduate lectures in obstetrics, a supply of proper forms for the study of maternal deaths and pamphlets outlining the minimum standards of prenatal care for lay distribution. It is felt that the committees of county societies should study the need for prenatal care within its own county and the methods for conducting these clinics as well as the proper organization of obstetrical services in hospitals. The State Department of Health has promised to finance at least part of the work in postgraduate education, in obstetrics, and has offered statistical service in connection with maternal mortality studies. It is hoped that the Department will also undertake the publication of pamphlets for lay distribution, either formulated or approved by this Committee. A conference of the chairmen of maternal welfare committees of county medical societies will be held in connection with the annual meeting of the State Society. Representatives from the above men-

tioned counties will report on their maternal mortality studies and welfare programs at this conference. These reports will be included in a more detailed supplementary report from our Committee, similar to that on Pneumonia Control which was published last year. It is again emphasized that the most apparent need in connection with our work in maternal welfare is the organization of active committees in county medical societies.

Child hygiene Every county society has been informed of the increased governmental funds made available in the State Department of Health, through the Social Security Act for use in Child Hygiene work. This information was announced in a letter of October 26, 1936, and each society was urged to make plans for directing this work in its own county. A letter to the sub-committee from Commissioner Godfrey of the State Department of Health, outlining the Social Security Act as it affected New York State, was published in the February 15 issue (p 435) of the NEW YORK STATE JOURNAL. A copy of this letter was also sent to every county society by the sub-committee on January 27, 1937. Acknowledgements have been received from the following counties: Clinton, Kings, Nassau, Oneida, Onondaga, Queens, Richmond, Rockland, St. Lawrence, Tompkins, Westchester, and Wyoming. It is difficult to develop a definite program on Child Hygiene suitable for all counties. Consequently the sub-committee has planned to hold regional meetings in order to discuss these matters with representative physicians in the various districts. The sub-committee has had one meeting in Albany and is planning for future meetings in other districts of the State. Again the most important need for effective work in Child Hygiene is organization of effective committees in county societies.

Cancer control This sub-committee has been organized during the present year. Cancer control was reported on by a special committee of the House of Delegates at the 1931 annual meeting, after which time, this activity was delegated to the Committee on Public Health and Medical Education. The policies and plans embodied in that report have formed the basis of activity for the Committee since that time. The sub-committee is continuing its activities from that point. The sub-committee has held three meetings, to one of which a group of physicians particularly interested in this subject were invited. In addition officials from the State Institute for the Study of Malignant

replaced Dr Fairfax Hall, who found it impossible to serve on the Committee. This plan of having sub-committees has proven efficient and economical. The sub-committees have met as occasions required. Physicians, not Committee members, who, because of their particular activities, are qualified to advise on particular problems, have attended the sub-committee meetings. The sub-committees have reported their activities to the whole Committee for final approval. Thus, it has been necessary for the entire Committee to meet only twice, once before the Council meeting, and once recently before the annual meeting. Dr Schiff has been delegated to represent this Committee on the Joint sub-committee on the Deaf and Hard-of-Hearing. The sub-committee on Preventive Medicine, consisting of Dr O W H Mitchell, chairman and Dr Greene and Dr Whipple has been continued.

Pneumonia Control. The Pneumonia Control program sponsored by the State Department of Health, the State Association of Public Health Laboratories, the Metropolitan Life Insurance Company, the Commonwealth Fund, as well as the State Medical Society has progressed most satisfactorily. Our Committee published a detailed and informative report on this subject in the *NEW YORK STATE JOURNAL OF MEDICINE* (July 15, 1936, pages 1053-63). This activity of the State Society has elicited much commendation. In his address before the annual conference of the Secretaries of Constituent State Medical Associations of the American Medical Association, in Chicago, in November 1936, Dr Thomas Parran, Jr, the Surgeon-General of the United States Public Health Service described how this work in the State of New York was started by the State Medical Society, and described the liaison between the State Medical Society and the State Department of Health as "a fine example of mutual cooperation in the solution of a problem which could not be handled by the doctors working alone or by the health department working alone." The Pneumonia Control Program is being extended to the City of New York, under the direction of a local committee of which Dr Russell Cecil is chairman. This program has received the hearty endorsement of the New York County Medical Society and the New York Academy of Medicine.

Because of differences between New York City and the rest of the State, this is, ap-

parently, the best method of dealing with this situation. On January 1 of this year, the State Department of Health began to supply gratuitously to physicians anti-pneumococcus serum for Type II pneumonia. Only Type I serum had been supplied before. A program on pneumonia control has been formulated and sent to county medical societies. Briefly this program included suggestions as to topics for medical meetings, availability of laboratory service, cooperation of hospital staffs, reports from physicians of cases where serum has been used, reports of interesting cases treated with serum, consideration of nursing service, education of the public. A letter has been sent to the State Hospital Association requesting the cooperation of the management of hospitals in this program. Five county medical societies have arranged scientific programs dealing with pneumonia during the current year, bringing the total up to date to thirty-seven. It is hoped that before the end of the current year all county medical societies will have had at least one program dealing with this subject. A hand book on the "Nursing Care of Pneumonia" has been prepared under the joint auspices of the New York State Nurses' Association, the New York State Department of Health, the General Advisory Committee on Pneumonia Control of the New York State Department of Health, the Nursing Advisory Committee to the Bureau of Pneumonia Control of the New York State Department of Health and the Committee on Public Health and Medical Education of the State Medical Society. This hand-book has been distributed to every Registered Nurse in the State. The interest manifested by various nursing organizations and departments has been greatly appreciated. Attention is directed to the prize of one hundred dollars offered through the Advisory Committee on Pneumonia Control of the State Department of Health for the best report of a series of cases on pneumonia. Announcement of this prize was made in the February 15, and March 1 issues of the *NEW YORK STATE JOURNAL OF MEDICINE*. Frequent references to the Pneumonia Control Program have appeared in our *NEW YORK STATE JOURNAL*. It is realized that so far our work has only been a beginning and there is still much to be done in this program. During the year 1936, only fifty per cent of hospitalized cases of pneumonia had bacteriological examinations. It is evident that there must be some cases suitable for serum treatment where this therapy is not carried out. The cooperation and aid of Dr Edward S Rogers, Director of the Bureau of Pneu-

The Committee wishes to acknowledge the cooperation received from the President and Secretary of the State Medical Society, the members of the Executive Committee and the other committees. It is also appreciative of the aid which has been given by the various physicians in

the way of advice and support. The chairman is deeply grateful to the members of the Committee for their continued and active service.

Respectfully submitted,

THOMAS P. FARMER, M.D., *Chairman*
April 1, 1937

REPORT OF COMMITTEE ON ARRANGEMENTS

To the House of Delegates, Gentlemen:

The Medical Society of the County of Monroe, the Rochester Academy of Medicine, and the City of Rochester welcome the opportunity to entertain the Medical Society of the State of New York at its annual meeting on May 24, 25, 26, and 27.

We consider ourselves most fortunate in having secured the magnificent Chamber of Commerce building which will be adequate to house our scientific meetings in exceptional comfort, as well as take care of all of the exhibits. It is centrally located at 55 St. Paul Street, just a few steps from Main Street, and in close proximity to all of the leading hotels.

The scientific program will be one of the finest that has ever been presented at an annual meeting. Both the general practitioner and the specialist will find plenty of new material here, thus compensating and justifying his attendance at the Rochester convention.

The scientific exhibits will be of their usual high quality, and great care has been exercised in the selection of the commercial exhibits.

Through the courtesy of the University of Rochester we will have the use of the Eastman Theatre for the Wednesday night public meeting. The theme of this meeting is "The Relation of Photography and Motion Pictures to the Science and Practice of Medicine." Our committee has developed a program that will be long remembered.

This year we have deviated slightly from the program of other years and have planned a fourth day of entertainment. For those interested in golf, the facilities of the Oak Hill Country Club will be available. This club has two of

the finest eighteen-hole golf courses in the United States. The Lilly trophy will be competed for by the various academies of medicine, and, in addition, many other individual prizes have been donated, and will be available in competitive matches of sundry types.

For those not interested in golf, arrangements are being made for visits to the research laboratories of the University of Rochester Medical School and to the five other Rochester hospitals. The executives of the many industrial concerns located in Rochester, famous throughout the world for their manufacture of scientific apparatus and materials so essential to the practice of medicine, are enthusiastic concerning the convention and extend a hearty welcome to the doctors to visit their plants.

The Ladies Entertainment Committee has arranged a program for the wives which is full of interest and promises to give them much pleasure. In addition, they are cooperating with the Woman's Auxiliary of the Medical Society of the State of New York, so that the only ladies we cannot guarantee a grand time during the convention will be those who remain at home and do not even give us a chance to demonstrate what Rochester hospitality really means.

Our banquet committee has secured speakers of prominence and of great appeal. The Chamber of Commerce has the largest and finest banquet hall in the city, and we expect to fill it to capacity. Spring flowers, soft music, fine cuisine, stimulating speakers—all to be followed later by dancing to music that will make one forget all care—leads us to believe you can't afford to remain away.

The hotel committee stands ready to give assistance to those who are not

Disease and officers of the State Committee of the American Society for the Control of Cancer were invited. The Committee has communicated with each county society, requesting that the subject of cancer control be delegated to some already existing committee, or a special committee appointed for this purpose. Such arrangements have been perfected in fifteen county societies. Subjects suggested for consideration by these committees include the following: One regular or special meeting of each society to be devoted each year to the subject of cancer, to which the members of the dental profession shall be invited, establishment of consultation clinics, by and under the auspices of the county society, for service to the indigent patient, as well as for the purpose of post-graduate education for the physician, organization of a list of speakers properly qualified to give talks on cancer. The sub-committee has invited the chairmen of county committees to seek special counsel when needed and to request periodic reports on the progress made in county societies. In any of these programs the cooperation of the New York State Committee of the American Society for the Control of Cancer should be requested, and maintained, as has been the custom in the past. At a meeting of the sub-committee with the group of advisors, it was suggested that instruction regarding cancer in medical colleges might be more effective by giving a course on neo-plastic diseases. The Committee expects to confer with the deans of the medical colleges of the state regarding this matter. The success of a program on the part of the State Society will depend upon the organization of active committees in county medical societies.

Syphilis control There are no special matters to be reported as regards Syphilis Control. A member of the Committee, Dr Mitchell was delegated to attend the conference called in Washington on December 28-30, by the Surgeon-General of the United States Public Health Service. Judging from the program adopted at the conference, apparently the work of the Committee a year ago had fulfilled all the purposes, so far as New York State was concerned. A questionnaire regarding this matter submitted by the Surgeon-General has been answered. A series of graduate lectures on Syphilis has been arranged, to be given in Chemung County, and will be repeated in other counties when requested. The purpose of this course of lectures is to provide the general physician with information which will prepare him to participate in the present nationwide campaign to control this disease. It is advisable that the public

health committees of all county societies inform themselves of the program of the State Department of Health regarding syphilis control, and of the action taken by this Committee in regard to that program, which was approved by the council of the State Medical Society.

Nursing education The sub-committee on nursing education met in Albany on January 9 as guests of the directors of the New York State Nurses Association. The subject was the new bill about to be introduced to amend the nurse practice act in this State (the so-called Esquirol Bill, No 368). Present were Drs Peter Irving, Joseph Lawrence, Clayton Greene, and Homer L. Nelms, chairman of the Legislative Committee. The bill was read in its entirety and each portion was discussed. It was pointed out that a strict interpretation of the definition of nursing would prevent orderlies in hospitals from giving an enema and similar procedures. There was considerable discussion of the best term to use for the second grade of nurse. The bill proposes nurses' aide, but it was suggested that domestic nurse be considered as a substitute. In general the subcommittee felt that the bill was a proper one and designed to improve the character of nursing service provided for the people of New York State. This report was accepted by the Committee.

General Comment

The Committee has aided county medical societies in the preparation of their scientific programs, and has advised with societies regarding their local public health programs. During the current year, the Committee has again supplied information to other state medical societies regarding its work in graduate medical education. A questionnaire received from the American Medical Association requesting detailed information as to the activities of the New York State Medical Society in graduate education has been answered. The Committee has recommended to the Executive Committee that they request the State Department of Health to issue to each new licensee in medicine a circular of instruction regarding registration of new licenses and annual re-registration of physicians as well as the preparation of a pamphlet containing information essential for every physician regarding the Public Health Law and the Sanitary Code.

REPORT OF COMMITTEE ON LEGISLATION

To the House of Delegates, Gentlemen

As this is written the Legislature has not yet adjourned. The report, therefore, covers our activities, observations, and recommendations to date only and is subject to such further modifications as the changing panorama of legislative activities demand. A brief supplemental report will be issued at the close of the legislative session.

The present Legislative Committee came into existence before the 1936 session of the Legislature had actually closed. Adequate study and mature deliberations had already been given to pending bills by the previous Committee so that no change of policy was thought necessary nor desirable.

Our Committee has carefully reviewed the mandates of the House of Delegates and made an honest effort to follow not only the spirit but the letter of your instructions to us. We have also carefully studied the matters referred to us by the Executive Committee and rendered reports which we believe are in keeping with sound professional and public policy.

Licensing of Foreign Physicians

One of the first major problems to engage our attention was the excessive number of foreign physicians that were being licensed by endorsement in New York State. In anticipation of legislation correcting this evil, we made a study of the problem. During the five-year period, 1931 to 1936, 843 foreign physicians were licensed in New York State and 478 in thirty-six other states studied. Of the 843 licensed, 364 were licensed without examination by endorsement of their license under Section 51 of the Education Law. Without detailing the extent of our activities, let it suffice to say that the Board of Regents, in full appreciation of the problem, adopted the following ruling on September 21, 1936:

That on applications filed after October 15, 1936, no license issued by a legally con-

stituted board of examiners in any foreign country shall be endorsed, pursuant to the provisions of Section 51 of the Education Law, until the applicant shall pass the licensing examination prescribed by law or Regents' rule.

This ruling brings to an end the licensing of foreign physicians by endorsement without examination, therefore, it would seem that one phase of the foreign physician problem has been solved by administrative action and without the necessity of immediate additional legislation.

Basic Science Law

We have carefully considered the desirability of a so-called basic science law whereby all applicants for licensure to the healing art be required to pass examinations in certain fundamental sciences which are designated as basic. The Committee feels that the provisions of our Medical Practice Act should be considered the basic requirements for licensure to practice the healing art. However, in those states which license chiropractors, naturopaths, naprapaths, and other cults, basic science requirements are highly desirable and effective. There is no need of a basic science law in this State at this time.

Administration of Anesthesia

The last session of the House of Delegates adopted the following resolution on the subject of anesthesia:

That the proper committee of the Medical Society of the State of New York be directed to draft and promote at the 1937 session of the New York State Legislature a bill to limit the administration of anesthesia to duly licensed physicians and dentists, except in cases of emergency.

Mindful of the fact that a bill covering these features was introduced and failed of enactment two years ago, your Committee gave prolonged and serious consideration to this question with a view of crystallizing professional and lay support for its enactment. We interviewed leading anesthetists of the State who are

able to secure adequate accommodations. In this connection we urge physicians whose wives are members of the Woman's Auxiliary of the State Society to secure reservations at the Hotel Seneca as early as possible, as this hotel is to be the headquarters and meeting place of the Woman's Auxiliary.

We promise to leave nothing undone that will contribute to the enjoyment of our guests. We know that the State Society commands your loyalty, the scientific program and exhibits will have your respect and arouse your interest, the commercial exhibits will deserve your attention, and certainly a fourth day of

relaxation will bring joy to the hearts of all who participate.

The headquarters for the meeting will be the Hotel Seneca.

Again let me urge you to secure reservations as soon as possible. Rochester is going to have a great meeting. Put "May 24-25-26-27 ROCHESTER" on your schedule and plan now to let nothing interfere with your coming. *We are looking for you!*

Respectfully submitted,

LEO F. SIMPSON, *Chairman*

April 1, 1937

REPORT OF COMMITTEE ON SCIENTIFIC WORK

To the House of Delegates, Gentlemen

The Committee on Scientific Work has held two sessions at each of which the attendance was satisfactory.

The programs prepared by the various sections we believe to be of unusual merit and particularly to be commended for their well balanced character.

The Committee on Arrangements has provided rooms for all sections under one roof, the Rochester Chamber of Commerce Building, which will also house the general sessions, technical exhibits and the House of Delegates.

On account of the natural limitations in space giving a comparatively small area for the scientific exhibit, it was the decision of the Committee to invite the Rochester School of Medicine and Dentistry to take over the major portion of that space for a group of scientific educational exhibits which are of unusual value and will be found listed in the printed program.

The motion picture theatre exhibit with a continuous display of medical films in monochrome and in color, as arranged for the New York meeting and which aroused so much interest is being continued and expanded. Dr. Clarence V. Costello is in charge of the entire Scientific Exhibit and has been ably assisted in many of the details of the motion picture display by Dr. John Henderson, a member of the

Advisory Committee on Exhibits.

For the general sessions we are indebted to Dean George H. Whipple of Rochester for his activities and advice in the arrangement of the symposium on "The Blood," and to Dr. Byron Stookey for his assistance in arranging the symposium on "The Relief of Intractable Pain."

We are particularly indebted to the President of the Society, Dr. Floyd S. Winslow, for his invaluable assistance and remarkable ability to pour out the resources of his home city toward the making of a grand meeting.

On the evening of May 26 there will be a combined session of popular and scientific interest sponsored by the Committee on Arrangements and the Committee on Scientific Work which I am sure will prove interesting because of its novelty and excellency.

For the fourth day a recreational program has been arranged and opportunity will be given for visiting various hospitals and the industrial plants where the manufacture of apparatus and paraphernalia used in scientific work in the practice of medicine has reached such high development.

Respectfully submitted,

WILLIAM A. GROAT, *Chairman*

April 1, 1937

COMMITTEE ON LEGISLATION

April 15, 1937

That the Executive Committee rescind the action taken on February 20, 1936 that the Committee on Legislation be instructed to oppose the passage of Assembly bill Int. 919, by Mr. Moran, to amend the insurance law to permit operation of a non-profit indemnity service which will furnish money, on specified conditions, for the payment of expense of needed medical care, and instruct the Committee on Legislation to approve the bill as amended.

The Moran bill of 1936 failed of passage. Realizing that similar legislation would probably be introduced in 1937, Dr. Lawrence and your Chairman visited Brattleboro, Vermont on November 7, 1936, where such a system was said to have been in successful operation for a number of years. Details of this study were submitted to a special committee under date of February 1, 1937.

In view of the material before us, the Legislative Committee recommended the disapproval of enabling legislation that would permit the formation of a non-profit medical indemnity service in this State at this time.

Certain features of these proposals are commendable. The sponsors are no doubt actuated by the highest motives. However, their adoption carries with them certain inherent dangers which must be diligently kept in mind. There is always danger that a voluntary scheme of this type will ultimately become compulsory. We are reliably informed that many of the compulsory types of health insurance abroad began first as voluntary units. Such a transition may be made necessary by poor management of the local unit so that the state is ultimately compelled to take it over, or political parties seeking popular issues present it to the public under the caption of "Something for Nothing" and thus are carried to victory.

Any insurance scheme to survive must be on an actuarial basis unless its funds are supplemented by the state or by charity. Actuarial determinations mean rate fixing and in its final analysis fee regulations for services rendered, in other words, a fee schedule. Rather than vigorously support such hazardous proposals, would it not be far better to send out our cry for higher wages and a higher stand-

ard of living, so that the low income group can buy on their own volition not only needed medical service, but the other necessities and comforts of life as well? In view of the fact that additional legislation is necessary before any type of health insurance could operate in this State, whether sponsored by us or by other groups, we make the following specific recommendations:

1 We recommend that studies along the lines of voluntary health insurance be continued,

2 That in the future funds allotted be designated for study only and in no sense be used either directly or indirectly, or by implication, for the purposes of propaganda or in any way supporting, either openly or otherwise, any type of voluntary or compulsory health or indemnity insurance, by whatever name known, either within or without the profession, until the matter has been formally adopted by the House of Delegates, either in regular or special session, as the stated policy of this Society. We further recommend that all officers and committees be held to strict accountability for the faithful carrying out of these provisions.

Conference of County Society Legislative Chairmen

Our annual conference of legislative chairmen was held in Albany on February 12, 1937. Thirty-five County Societies were represented. We also had the members of our Advisory Committee at this conference. This was one of the largest conferences that was ever held and is indicative of the interest that our members have taken in legislative work. We carefully reviewed all the bills presented up to that time and were able to secure a good cross-section of opinion on legislative matters. It is recommended that these annual conferences be continued.

Legislative Bulletins

We have 339 persons on our bulletin list. These include officers of the State Society, members of County Society Legislative Committees, members of our Advisory Committee, the legislative chairman of the Women's Auxiliary in each county where these organizations exist. We also

members of the State Society and represent state and national associations on anesthesia. We consulted with the chairman of the new Session on Anesthesia of the State Society, and also many physicians at random throughout the State. We investigated the situation of the nurse anesthetist in California, especially the legal opinion carried to and sustained by their highest courts on this subject. A complete report of our findings was presented to the Council under date of December 7, 1936. You will recall that by referendum vote you have relieved us of sponsoring this type of legislation at this time.

We heartily approve the action of the House, but realize that it is based on a question of expediency and is not a true solution of the problem. The Legislative Committee is in entire accord with the principle that anesthesia should be developed as a special branch of medicine. We believe that true progress in this field can come only through original observations and research by medical men. From a scientific standpoint we believe that real progress is being retarded because this field has been taken over by others. We recommend that the Medical Society of the State of New York, through all its agencies—educational, scientific, and publicity—stress the scientific phase of the practice of anesthesia, encourage and sponsor facilities by which physicians can equip themselves to assume the growing responsibilities which the administration of not only the older, but also the newer anesthetics impose upon us. Thus done effectively, the proposed legislation will then stand a better chance of enactment.

Medical Expense Indemnity Insurance and Other Health Insurance Proposals

Second only to spiritual developments is the maintenance of health and the well-being of our people. Realizing this fact, it is but natural that attempts should be made from time to time to improve public health and relieve economic distress by changing the method by which medical service is rendered. Some of

these ideas have crystallized in the form of compulsory health insurance measures, and this year there have been in the National Congress and also in the New York State Legislature, compulsory health insurance bills. The Socialist Party had a plank in their 1936 platform favoring free medical service on the same basis as we now have free education supported by taxation. We recognize that health is not dependent entirely upon the quantity nor the quality of medical service rendered in time of sickness. Intimately associated with this problem is the question of hereditary and environmental factors, proper housing, adequate food, regulating the hours of labor, a better understanding of the fundamental rules of personal and public health, and the scientific application of a host of other commendable social and economic principles.

Insurance alone is not a panacea for these ills. We have the experience in certain quarters abroad whereby the profession has been demoralized and the quality of medical service lowered by excursions into the field of compulsory health insurance under political domination.

With these things in mind, we have consistently maintained the traditional professional opposition to all such proposals, and it is highly improbable that the bills introduced will even get out of committee this year. Fortunately, the groups sponsoring these proposals have not as yet been especially vocal in legislative halls.

Closely allied, and as part of the larger picture, are the various voluntary schemes devised to relieve the economic distress of the profession and spread the cost of medical care on a group basis to low income groups. Whether this be created as a mutual aid association, medical expense indemnity insurance, non-profit indemnity service, or by any other name that has been or will yet be devised, it is essentially a form of health insurance. The question came directly under the jurisdiction of the Legislative Committee by action of the Executive Committee under date of April 28, 1936, and which reads as follows:

COMMITTEE ON LEGISLATION

April 15, 1937

That the Executive Committee rescind the action taken on February 20, 1936 that the Committee on Legislation be instructed to oppose the passage of Assembly bill Int-19, by Mr Moran, to amend the insurance law to permit operation of a non-profit indemnity service which will furnish money, on specified conditions, for the payment of expense of needed medical care, and instruct the Committee on Legislation to approve the bill as amended

The Moran bill of 1936 failed of passage. Realizing that similar legislation would probably be introduced in 1937, Dr Lawrence and your Chairman visited Brattleboro, Vermont on November 7, 1936, where such a system was said to have been in successful operation for a number of years. Details of this study were submitted to a special committee under date of February 1, 1937

In view of the material before us, the Legislative Committee recommended the disapproval of enabling legislation that would permit the formation of a non-profit medical indemnity service in this State at this time

Certain features of these proposals are commendable. The sponsors are no doubt actuated by the highest of motives. However, their adoption carries with them certain inherent dangers which must be diligently kept in mind. There is always danger that a voluntary scheme of this type will ultimately become compulsory. We are reliably informed that many of the compulsory types of health insurance abroad began first as voluntary units. Such a transition may be made necessary by poor management of the local unit so that the state is ultimately compelled to take it over, or political parties seeking popular issues present it to the public under the caption of "Something for Nothing" and thus are carried to victory.

Any insurance scheme to survive must be on an actuarial basis unless its funds are supplemented by the state or by charity. Actuarial determinations mean rate fixing and in its final analysis fee regulations for services rendered, in other words, a fee schedule. Rather than vigorously support such hazardous proposals, would it not be far better to send out our cry for higher wages and a higher stand-

ard of living, so that the low income group can buy on their own volition not only needed medical service, but the other necessities and comforts of life as well? In view of the fact that additional legislation is necessary before any type of health insurance could operate in this State, whether sponsored by us or by other groups, we make the following specific recommendations

1 We recommend that studies along the lines of voluntary health insurance be continued,

2 That in the future funds allotted be designated for study only and in no sense be used either directly or indirectly, or by implication, for the purposes of propaganda or in any way supporting, either openly or otherwise, any type of voluntary or compulsory health or indemnity insurance, by whatever name known, either within or without the profession, until the matter has been formally adopted by the House of Delegates, either in regular or special session, as the stated policy of this Society. We further recommend that all officers and committees be held to strict accountability for the faithful carrying out of these provisions

Conference of County Society Legislative Chairmen

Our annual conference of legislative chairmen was held in Albany on February 12, 1937. Thirty-five County Societies were represented. We also had the members of our Advisory Committee at this conference. This was one of the largest conferences that was ever held and is indicative of the interest that our members have taken in legislative work. We carefully reviewed all the bills presented up to that time and were able to secure a good cross-section of opinion on legislative matters. It is recommended that these annual conferences be continued.

Legislative Bulletins

We have 339 persons on our bulletin list. These include officers of the State Society, members of County Society Legislative Committees, members of our Advisory Committee, the legislative chairman of the Women's Auxiliary in each county where these organizations exist. We also

send the bulletins to other interested groups. The bulletin gives a brief description of the bills, together with what relative comments we think necessary or advisable. To date ten regular and five special bulletins have been sent out. Printed copies of bills are sent to the legislative chairman in each county and also to members of our Advisory Committee and other interested persons. Individuals receiving the bills and bulletins are asked to comment and in this way we get additional information which materially assists us in determining policy. On particular questions involving special subjects, we call on distinguished members of the Society for their opinion and help in interpretation of pending or proposed legislation. We are very appreciative of the help received from these special sources, not only for its completeness, but for the readiness with which it is given.

To date 160 bills have been introduced affecting the profession either directly or indirectly. We have vigorously supported legislation which would make our Medical Practice Act consistent by removing provisions for any further licensure of physiotherapists. We have also sponsored a lien bill, an advertising bill, an injunction bill, a bill correcting certain evils in the field of radiology, and at the moment are vigorously opposing the osteopathic bill. This bill would considerably enlarge the scope of osteopathic practice, permitting major surgical procedures, the administration of anesthesia, narcotics, antiseptics, vaccines, and antitoxins, and on careful analysis would have far-reaching consequences. A detailed report on all the bills would be impractical at this time. Our action is recorded in the various

bulletins sent out from time to time and which are reported in the several issues of the JOURNAL.

Congressional Activity

We have made a special effort this year to keep in touch with legislative activities at the National Capital. This is done through the Legislative Bureau of the American Medical Association and by direct contact with individual Congressmen. It is hoped that our activities in this field can be continued and enlarged.

We can not conclude our report without paying special tribute to the help of Miss Briggs in the Legislative Bureau and our Executive Officer, Dr. Joseph S. Lawrence. Dr. Lawrence has learned much during his years of intimate contact with the Legislature and the profession, and has acquired a legislative background developed only by experience and unselfish devotion to his work. We are all better because of the service he has rendered.

This brief resume is but an inkling of the amount of work actually done by the Legislative Committee. Meetings have been held, telephone conferences arranged, work detailed by individual members of the Committee, much of it in the form of effort that can not be reduced to hours of time nor pages of a written report. If our activities have saved you from some of the bad laws you might have had, and given you even a few of the good ones you ought to have, we feel that our efforts will not have been in vain.

Respectfully submitted,

HOMER L. NELMS, *Chairman*

April 1, 1937

COMMITTEE ON REVISION OF CONSTITUTION AND BY-LAWS

To the House of Delegates, Gentlemen:

In compliance with your instructions, the Committee on Revision of the Constitution and By-Laws herewith submits its report for your consideration.

Relatively few members of the Medical Society of the State of New York will have the time for a detailed study of the proposed Constitution and By-Laws. Therefore the Committee on Re-

vision calls attention to some of the most important changes proposed with reasons for such changes.

The proposed change of most importance concerns the central governing body. At present there is a Council composed of the following: (a) officers of the Society, including the Presidents of the District Branches as Councilors, (b) chairmen of the standing committees, (c) the retiring President for a term of one

REVISION OF CONSTITUTION AND BY-LAWS

year after his term of office expires. Ordinarily the Council meets but twice a year and the constant changing of membership is most unfortunate. Regional representation is assured by Councilors (District Presidents), but short tenure terminates too soon the services of many valuable officers.

The Executive Committee is composed of five of its members chosen by the Council, three of whom must be Councilors (District Presidents), in addition to the President, President-elect, the Secretary, the Treasurer, and the immediate Past President. Again membership is constantly changing after short tenures of office.

In order to carry on the numerous activities of the Society there are many Committees. The present standing Committees total a membership of fifty-five and provision for them to coordinate their work as it should be is one of the pressing needs of the Society.

There should be the closest association between those who control the purse strings and those who are responsible for the activities. A plan whereby a finance committee is a part of the governing body ought to improve this relationship. It is realized that objections to this proposal will quickly come to mind. Remember—this is the Medical Society of the State of New York and not a government authority. Surely a Medical Society like ours does not need the checks, balances and intricate management required for public funds.

The above are some of the problems with which the Committee on Revision has been concerned. As a result of the study, it is proposed to have a central governing body designated as a Council of Trustees which will replace the present Council, Executive Committee, and Board of Trustees and will be empowered to create small committees (at least one member of each shall be a Trustee) to replace the present Council of Trustees. The membership of the proposed Council of Trustees is to consist of the President, President-elect, the immediate Past-President, the Treasurer, and fifteen Trustees elected for five year terms. District Presidents who at present are Councilors during their presidential terms will be District Delegates in the

proposed plan and represent their Districts in the House of Delegates. This consolidation will increase efficiency and should decrease operating costs.

How the Society has operated so many years without a full-time secretary is a cause for wonderment to those who know it and probably a great surprise to those who have not known it. Those in charge of the Society's business realize the need of such an officer and it is the belief of the Committee that the entire membership will favor the creation of such an office which is to bear the designation, Director of Activities. It will cost more money for his salary but it will be worth it because it will result in savings elsewhere and will increase efficiency.

The proposed Associate Director is not a position necessitating increased expense. It is a change in name from the present "Executive Officer."

The Committee on Revision earnestly requests serious study by the members of the Society of the proposed Constitution and By-Laws. The Committee is not looking for a 'vote of confidence' nor does it propose to harangue the members in order to justify its proposals. It submits the results of the study and realizes that there must be mistakes and imperfections. It is expected that valuable suggestions will be made before an instrument wholly satisfactory is adopted.

Dr Chas Gordon Heyd was chairman of a committee known as the Committee for Study, Survey and Consolidation of Executive Offices which reported to the House of Delegates, April 27, 1936. This report closed with the following paragraph: "The administering of the affairs of the Society under the proposed changes indicated above would be carried on with a material saving in costs and a marked increase in effectiveness of purposes of organization." The Committee on Revision hopes that the plan submitted will bring these desired results.

Respectfully submitted,
 OLIVER W H MITCHELL, Chairman
 THOMAS H CUNNINGHAM

April 1, 1937

Constitution

Article I

Name and Purposes

The name and title of the Society shall be the Medical Society of the State of New York. The purposes of the Society shall be to federate and bring into one compact organization the medical profession of the State of New York, to extend medical knowledge and advance medical science; to elevate the standard of medical education, to secure the enactment and enforcement of just medical and public health laws, to promote friendly intercourse among physicians; to safeguard the professional and economic integrity of its members and to establish and maintain them in appropriate and equitable relationship with the public, with government and with all agencies working in the fields of health and welfare, and to enlighten and direct public opinion in regard to the problems of medicine and health for the best interests of the people of the State.

Article II

Membership

The membership in this Society shall be divided into three classes (a) Active (b) Retired (c) Honorary

Article III

House of Delegates

There shall be a House of Delegates which shall be the legislative body of the Society and shall be charged with the general management, superintendence, and control of the Society and its affairs and shall have such general powers as may necessarily be incident thereto, except as otherwise specifically provided by the Constitution and By-Laws. It shall pass upon the credentials and qualifications of delegates and shall decide who are entitled to be members of the House of Delegates. It shall have authority and power to suspend or otherwise discipline its own members, District Branches, component County Medical Societies or any member of the Society charged with special duties for and under authority of the State Society. It shall provide for a division of the scientific work of the Society into appropriate sections, for the organization of the District Branches, for rules and regulations for its own govern-

ment and for the administration of the affairs of the Society. When the House of Delegates is not in session, the Council of Trustees shall exercise all the rights and duties of the House of Delegates that are not inconsistent with the Constitution and By-Laws of the Society. (See By-Laws)

Article IV

Council of Trustees

There shall be a Council of Trustees composed of the President, the President-Elect, the immediate Past-President, the Treasurer, and fifteen other members elected by the House of Delegates. The Speaker of the House of Delegates shall sit in the Council of Trustees with voice but without vote.

Article V

Officers

The officers of the Society shall be a President, a President-Elect who shall serve as first Vice-President, a second Vice-President, a Treasurer, an Assistant Treasurer, a Speaker, and a Vice-Speaker of the House of Delegates. They shall take office at the termination of the annual meeting at which they were elected.

Article VI

Board of Censors

There shall be a Board of Censors consisting of the President of the Society and four Presidents of District Branches, as provided in the By-Laws.

Article VII

Meetings

There shall be an annual meeting of the Society and of the House of Delegates to be held at a time and place designated by the House of Delegates.

Article VIII

Funds

Funds shall be raised by an annual per capita assessment on each component County Society at a uniform per capita rate throughout the State. Funds may also be raised in any other manner approved by the House of Delegates or by the Council of Trustees when the said House of Delegates shall not be in session.

The approval of the Council of Trustees shall be necessary for the expenditure of any funds of the Society

Article IX Referendum

At any meeting of the House of Delegates a majority of the members present may order a referendum vote of the Society on any question consistent with the Constitution and By-Laws and in accordance with such regulations respecting the submission of the question as the House of Delegates may prescribe. The members shall vote thereon by mail. The polls shall be closed at the expiration of fifteen days after the mailing of the question, and if the members voting shall comprise a majority of all the active members of the Society, a majority of such vote shall determine the question and be binding on the Society and the House of Delegates. The Council of Trustees may, in a similar manner, order a referendum to the House of Delegates.

Article X District Branches

Sec 1 The membership of the Society shall be divided into eight District Branches, as follows

The First District Branch shall comprise the members of the Medical Societies of the Counties of New York, Bronx, Westchester, Rockland, Dutchess, Putnam, Orange, and Richmond.

The Second District Branch shall comprise the members of the Medical Societies of the Counties of Kings, Queens, Nassau, and Suffolk.

The Third District Branch shall comprise the members of the Medical Societies of the Counties of Albany, Rensselaer, Schoharie, Greene, Columbia, Ulster, and Sullivan.

The Fourth District Branch shall comprise the members of Medical Societies of the Counties of St. Lawrence, Franklin, Clinton, Essex, Hamilton, Fulton, Montgomery, Schenectady, Saratoga, Warren, and Washington.

The Fifth District Branch shall comprise the members of the Medical Societies of the Counties of Onondaga, Oneida, Herkimer, Oswego, Lewis, Madison, and Jefferson.

The Sixth District Branch shall comprise the members of the Medical Societies of the Counties of Otsego, Delaware, Chenango, Cortland, Tompkins, Schuyler, Chemung, Tioga, and Broome.

The Seventh District Branch shall comprise the members of the Medical Societies of the Counties of Monroe, Wayne, Cayuga, Seneca, Yates, Ontario, Steuben, and Livingston.

The Eighth District Branch shall comprise the members of the Medical Societies of the Counties of Erie, Niagara, Orleans, Genesee, Wyoming, Allegany, Cattaraugus, and Chautauqua.

Sec 2 Each District Branch may adopt a constitution and by-laws for its government and may amend the same, but before becoming effective they shall be approved by the Council of Trustees. They shall be consistent with the Constitution and By-Laws of this Society.

Sec 3 Changes in the number or membership of these District Branches may be made by a two-thirds vote of the House of Delegates at any annual meeting.

Article XI County Societies

The terms County Medical Society or component County Medical Society shall include all County Medical Societies now in affiliation with this Society or which may hereafter be organized and chartered by the House of Delegates. There shall be but one County Medical Society in each County affiliated with this Society. If there should be an insufficient number of physicians in any of the Counties of this State to form themselves into a component County Medical Society, such physicians may become members of the component County Medical Society of an adjoining County when eligible by the Constitution and By-Laws of such County Society.

Article XII Amendments

Amendments to this Constitution, except such as are obligatory by law, shall be made only at an annual meeting of the House of Delegates. Notice of the proposed amendment shall be given at a previous annual meeting of the House of Delegates, and before the same can be acted upon, it shall be published at least once and at least one month before the annual meeting in the official publication of the Society.

A two-thirds vote of the members of the House of Delegates present and voting shall be necessary for adoption.

Amendments made necessary by law shall be made either by the Council of Trustees or House of Delegates whenever such necessity exists.

By-Laws

Chapter I Membership

Sec 1 The active members shall be all active members in good standing of the component County Medical Societies. A copy of the roster of such members, certified to be correct by the Secretary of such County Society shall be evidence of the right of the members whose names appear therein to membership in this Society. No member who has been dropped from the roll of a component County Society by reason of failure to pay dues shall be accepted by another Society except by regular transfer after reinstatement in the original Society.

Sec. 2 The term "good standing" is hereby defined as (a) A member is in good standing when his dues to his County Society and the assessment of the State Society have been paid when they are due and payable. (b) A member whose dues and assessments are unpaid after May 31 of any current year, is not in good standing. He is in arrears for dues. He has lost his right to malpractice defense by counsel of the Medical Society of the State of New York for any acts upon which suit may be predicated during the period of his arrearage. This last is not recoverable, even when he becomes reinstated. Immediately upon payment of dues during the current year, his right to malpractice defense by counsel of the Medical Society of the State of New York shall be restored from that date. (c) A member whose dues and assessment are unpaid after December 31 of any current year shall automatically be dropped from the rolls of membership of both County and State Societies, without notice to such member by his County Medical Society or the Medical Society of the State of New York, or without further action on the part of either County or State Society, and upon such date, he shall automatically cease to be a member of both County and State Societies.

Sec 3 Any member expelled from his component County Society or suspended from its rights and privileges, shall likewise be expelled or suspended for the same period from this Society. The right of appeal to this Society shall not be impaired, nor shall such appeal prevent the carrying out of the

judgment of the County Society pending such appeal. Members not in good standing or ceasing to be members of their County Societies, shall *ipso facto* have the same status in this Society. Suspension or expulsion shall terminate malpractice defense and automatically cancel the Society's malpractice insurance.

Sec 4 A member of one County Society shall not be permitted to transfer to membership in another County Society until he has established a legal residence in the County to which he desires transfer. The question of legal residence shall be verified by the Board of Censors of the County Medical Society to which the member desires transfer.

Sec. 5 Any member convicted in a court of law of a crime evincing moral turpitude shall thereupon cease to be a member of this Society.

Sec 6 A member in good standing in his component County Medical Society, reaching seventy years of age or if permanently disabled may *ipso facto* have the privilege of applying for retired membership in the State Society. All such applications shall be signed by the President and the Secretary of the County Society of the applicant and then sent to the Secretary of this Society for presentation to the House of Delegates for approval. Active members desiring to become retired members shall apply for such membership to the component County Society in the County of the residence of the applicant. Such applications shall be governed by the Constitution and By-Laws of the Component County Society relative to active membership. Retired members shall not be subject to assessment, but shall be accorded all the rights and privileges of active membership except voting and holding office.

Sec 7 The honorary members of the Society shall be all persons now on the roster as such and in addition such distinguished physicians residing outside of the State of New York as may hereafter be elected. All nominations for honorary membership must be endorsed by three members of the Society and forwarded to the Secretary for presentation to the House of Delegates, which by a two-thirds vote of the House of Delegates present and voting

shall be declared elected honorary members of this Society. Honorary members shall be entitled only to the privilege of attending and addressing the meetings of the Society.

Chapter II

House of Delegates

Sec. 1 The House of Delegates shall be composed of (a) Delegates elected by the component County Medical Societies, (b) Officers of the Society and other Members of the Council of Trustees, and (c) the President of the District Branches sitting as District Delegates. Past Presidents of the Society shall be life members of the House of Delegates with voice but without vote. Each component County Society shall be entitled to elect as many delegates as there shall be State Assembly Districts in such County at the time of the election, but each component County Medical Society shall be entitled to elect at least one delegate. A component Society representing by its name more than one County shall be entitled to as many delegates as there are Assembly Districts in the Counties named in the title of such Society.

Sec. 2 A delegate to this Society shall not be considered in good standing or entitled to vote in the House of Delegates if the component County Medical Society by which he was elected is in default of the payment of any dues or assessments imposed by the House of Delegates, and said County Society has been duly notified of such default, or if such component County Medical Society shall at the time be under sentence of suspension imposed by the House of Delegates, or if such delegate is not in good standing in this Society, or in the component County Medical Society to which he belongs. The term of a delegate elected by a County Medical Society shall begin at the first annual meeting of the House of Delegates subsequent to his election.

Sec. 3 The annual meeting of the House of Delegates shall be held on the day before the annual meeting of the Society. The sessions of the House of Delegates may be adjourned from time to time as may be necessary.

Sec. 4 A quorum shall consist of sixty duly elected or constituted members of the House of Delegates.

Sec. 5 The House of Delegates shall hear and finally determine all appeals taken from decisions of the Board of Censors.

Sec. 6 The House of Delegates shall provide for the issue of charters to County Societies in affiliation with this Society.

Sec. 7 The House of Delegates shall have authority to appoint special committees from among members of this Society.

Sec. 8 The following shall be the order of business at the sessions of the House of Delegates:

- 1 Calling the meeting to order
- 2 Report of Reference Committee on Credentials
- 3 Roll call by the Secretary
- 4 Reading the minutes of the previous meeting
- 5 Report of the President
- 6 Address by the President-Elect.
- 7 Report of the Board of Censors
- 8 Report of the Council of Trustees
- 9 Report of the Secretary
- 10 Report of the Treasurer
- 11 Reports of District Branches by District Delegates
- 12 Reports of Special Committees
- 13 Reports of Reference Committee
- 14 Unfinished Business
- 15 New Business
- 16 Adjournment

Chapter III

Election of Officers, Trustees and Delegates

Sec. 1 The Officers and the Trustees of the Society and the Delegates to the American Medical Association shall be elected at the last adjourned session of the annual meeting of the House of Delegates, which adjourned session shall be held at a convenient hour on the first, second, or third day of the annual meeting of the Society. No member of the Society who is in arrears for County dues or State Society per capita assessment shall be eligible for any office or entitled to vote for any officer, trustee or delegate.

Sec. 2 The President, the President-Elect, who shall serve as first Vice-President, the second Vice-President, the Treasurer, the Assistant Treasurer, the Speaker and the Vice-Speaker of the House of Delegates shall be elected for one year or until their successors have been duly chosen.

Three other members of the Council of

Trustees shall be elected annually for a term of five years, except in 1937, when three members shall be elected for five years, three for four years, three for three years, three for two years and three for one year. In the event of a vacancy, a Trustee shall be elected for the unexpired term.

Sec. 3 The first order of business at the last adjourned session of the House of Delegates of each annual meeting shall be the nominations for officers of the Society and other members of the Council of Trustees and delegates to the American Medical Association and the appointment of a sufficient number of tellers by the Speaker. After all nominations shall have been made the Secretary shall cause to be displayed in full sight of the delegates a list of nominees for each office arranged in alphabetical order, and shall also cause to be distributed a sufficient number of blank ballots for the use of the House of Delegates. These ballots shall have printed or stamped thereon the appropriate headings for each office with spaces thereunder in which may be written the name of the candidate or candidates to be voted for.

Sec. 4 All elections for such offices and positions shall be by ballot, each member depositing his ballot on roll call individually. In the event of a single nominee only for any office or position, a majority vote without ballot shall elect. In case no nominee for an office receives a majority of votes on the first ballot, the nominee receiving the lowest number of votes shall be dropped and a new ballot taken for that office. This procedure shall be continued until one of the nominees receives a majority of the votes cast when he shall be declared elected.

Sec. 5 The following method shall govern the election of delegates to the American Medical Association. Nominations shall be made for not less than double the full number of delegates to be elected, and the delegates shall be declared elected in the order of the highest number of votes cast until the allotted number shall have been chosen, a corresponding number in the next highest order of votes cast shall be declared alternate delegates. When the full number of delegates are not available for attendance at the meeting, the President shall appoint and certify a sufficient number to complete the quota.

Sec. 6 The delegates to the American Medical Association shall be elected in the calendar year preceding the meeting of the House of Delegates of the American Medical Association, to which they are elected and in accordance with the Constitution and By-Laws of that body for a term of two years. Delegates may be elected to other medical societies or similar bodies as the interests of the Society may require, and credentials shall be issued to all delegates, signed by the President and Secretary.

Chapter IV

Council of Trustees

Sec. 1 The Council of Trustees shall be the Executive and Administrative body of the Society while the House of Delegates is not in session and shall control all arrangements for the annual meeting. It shall prepare an annual budget. Its resolutions and actions shall be decisive and final except that all resolutions and actions of the Council of Trustees are subject to review, reconsideration, and action by the House of Delegates. Its actions shall be governed by the Constitution and By-Laws of the Society and the rules and regulations of the House of Delegates. The Council of Trustees shall have power and authority to employ, discharge, arrange duties and fix compensation of and for any employee which it may find necessary for conducting the affairs of the Society.

Sec. 2 The Council of Trustees shall meet at the close of the annual meeting of the House of Delegates. The members of the Council of Trustees shall hold office until their successors are duly elected and qualified.

Sec. 3 It shall meet at regular intervals at times and places that shall be fixed by the Chairman. Any four members of the Council of Trustees may require the Chairman thereof to call a meeting for such time and place as shall be designated by them in writing. Members must receive at least two days notice in letter or telegram from the Society's office.

Sec. 4 A quorum shall consist of eleven members.

Sec. 5 The Council of Trustees shall have charge of all property including trust funds and shall supervise the financial

affairs of the Society and shall invest the surplus from time to time, and all resolutions or recommendations of the House of Delegates pertaining to expenditure of money must be approved by the Council of Trustees before the same shall become effective. The administrative year shall begin July 1 and end June 30 of the following year

Sec. 6 All moneys of the Society received by the Council of Trustees or any member or agent thereof shall be paid to the Treasurer of the Society. The Council of Trustees shall approve the bond of the Treasurer and the Assistant Treasurer as to amount, form and surety, and shall employ a certified public accountant licensed by the State of New York to audit the accounts of the Treasurer and Secretary and other agents of the Society and present a statement of the same in its Annual Report to the House of Delegates

Sec 7 The Council of Trustees shall take such action as is necessary to carry out the Constitution and By-Laws and to give full effect to any resolution or vote of the House of Delegates. It shall also have power to legislate as a House of Delegates, when the latter is not in session, on all matters consistent with the Constitution and By-Laws

Sec. 8. The Council of Trustees shall have power to fill any vacancy which may occur in any elective office not otherwise provided for, until the next annual meeting of the House of Delegates

Sec. 9 The Council of Trustees shall have responsibility for all publications of the Society and their distribution. Any Special Committee of the Society shall report to the Council of Trustees and shall be subject in all ways to the Council of Trustees unless otherwise instructed by the House of Delegates. The Council of Trustees shall advise the legal counsel in actions brought against members for alleged malpractice. With the aid of legal counsel, it shall examine the Constitution and By-Laws of component County Societies and District Branches and all amendments thereto which may be submitted to the Council of Trustees for approval and shall approve or disapprove of said amendments

Sec 10 No Board, Commission, or Committee shall inaugurate or initiate any policy or commit the Society to any policy unless the same has been expressly approved by the House of Delegates or by the Council of Trustees

Sec 11 The duties of the Council of Trustees shall also include the study and/or supervision of the following activities

- (a) All Scientific Work presented at each annual meeting
- (b) Scientific Exhibits
- (c) Medical Education.
- (d) Journal Management and Publication.
- (e) Medical and related research.
- (f) Arrangements for annual meeting
- (g) Appropriations
- (h) Investments
- (i) Preventive Medicine.
- (j) Public Health
- (k) Legislation
- (l) Economics
- (m) Workmen's Compensation
- (n) Health and Welfare Departments of State.
- (o) Medical Publicity
- (p) Hospitals, Clinics, and Welfare Agencies
- (q) Cooperative Relationships with Federal and State Governments, Foundations and other lay groups
- (r) Malpractice Defense and Insurance.

Sec 12 Committees of the Council of Trustees may include other members of the Society and may be nominated by the President subject to the approval of the Council of Trustees. Each committee shall include at least one member of the Council of Trustees who shall be chairman, except that he need not be chairman for the committee or committees in charge of activities "A", "B" and "F", Chapter IV, Section 11 of the By-Laws. The Membership of committees shall not exceed three including the chairman, except the committee or committees in charge of activities "A", "B" and "F", Chapter IV, Section 11 of the By-Laws

Sec 13 The following shall be the order of business at meetings of the Council of Trustees

- 1 Calling the meeting to order
- 2 Roll Call
- 3 Reading of Minutes
- 4 Communications
- 5 Report of the Secretary
- 6 Report of Treasurer
- 7 Report of Committees
- 8 Unfinished Business
- 9 New Business
- 10 Adjournment

CHAPTER V

Board of Censors

Sec. 1 Members of the Board of Censors shall be nominated each year by the Presi-

dent and approved by the Council of Trustees at its first meeting following the annual meeting of the House of Delegates. They shall hold office for one year, or until their successors are elected. The President of the Society shall sit as the presiding officer of the Board of Censors, but shall vote only in case of a tie. The Secretary shall sit as Secretary of the Board without vote. The Board of Censors shall meet upon the call of the President. It shall report its findings to the House of Delegates.

Three Censors (not including the President) shall constitute a quorum. Each District Branch shall be represented upon the Board of Censors one year in each two years. When an appeal involves a member or members or a County Society or Societies in the jurisdiction of a Censor, such Censor shall be disqualified to act as a member of the Board of Censors and the President shall nominate an alternate for him in the person of another District Branch President who is not regularly serving as Censor.

When an appeal involves a member or members or a County Society or Societies within the District in which the President resides, he shall be disqualified to act as a member of the Board of Censors and the First Vice-President shall serve in his stead.

Sec 2 The Board of Censors shall have jurisdiction to hear and determine all appeals from decisions on discipline of component County Medical Societies or decisions of such Societies which may involve the privileges, rights or standing of members, whether in relation to one another or to County Medical Societies or to this Society. Any member of any component County Medical Society, feeling aggrieved by the decision of such Society may within three months after such decision appeal to the Board of Censors of this Society from the decision of such component County Medical Society by filing a notice of appeal with the Secretary of this Society, and the Secretary of the component County Society.

Sec 3 Any applicant for membership in a component County Medical Society who may have been excluded from membership in such Society, may likewise appeal from the action of said Society excluding him. All decisions shall be subject to appeal to the House of Delegates.

Sec 4 The notice of appeal shall set

forth in writing the name of the appellant, the name of such component County Medical Society and the date and substance of the decision appealed from and shall indicate the ground or grounds upon which such appeal is taken. If the appellant desires to be present in person or by counsel at the hearing of said appeal, the notice of appeal must so state. In that event, the appellant must file with the notice of appeal a bond in the sum of \$500 to cover the costs of said appeal. If the appellant fails to appear in person or by counsel upon the hearing of said appeal, he shall forfeit to the Medical Society of the State of New York such share of said bond as represents necessary expenditures incident to convening the Board of Censors for the hearing of said appeal.

Sec 5 Upon filing a notice of appeal, the appellant and the component County Medical Society shall submit to the Secretary of the Board of Censors all records, minutes, letters, papers, and all written evidence including a digest of all testimony not stenographically reported relating to the matter. All data so submitted shall be available only to the Censors, and on appeal, to the members of the House of Delegates.

Sec 6 The Board of Censors shall consider the appeal on the data so submitted to it, and may affirm by a majority vote, modify or reverse by a two-thirds vote of the Censors present and voting, the decisions so appealed from. If, in its opinion, the taking of further evidence is advisable, the Board of Censors may summon witnesses and proceed to take such evidence in such manner as it may deem proper and render its decision by a two-thirds vote of those present and voting, which decision shall be binding until reversed or modified by the House of Delegates.

Sec 7 The Board of Censors shall investigate all charges preferred (a) by a member of a component County Society against any component County Medical Society of which he is not a member, and (b) by a component County Medical Society against another such County Society or a member thereof, and the Secretary of the Board of Censors shall submit the report to the House of Delegates for action thereon.

Sec 8 A party desiring to appeal to the House of Delegates from the decision of the Board of Censors shall within three months

after such decision, file with the Secretary of this Society and the Secretary of the component Society a notice of appeal. Such notice of appeal shall set forth in writing the name of the appellant, the name of the component County Society, the date and substance of the decision appealed from and the ground or grounds upon which such appeal is taken. The appellant must also state if he desires to be present in person or by counsel.

Sec. 9 Upon the filing of a notice of appeal the appellant and the Secretary of the Board of Censors shall submit to the House of Delegates the decision and all records, minutes, letters, papers, and all written evidence including a digest of all testimony not stenographically reported relating to the matter.

Sec. 10 The House of Delegates shall consider and decide the appeal on the data submitted to it, and may affirm, modify or reverse the decision so appealed from. Such decision of the House of Delegates shall be final and binding.

Chapter VI

Duties of Officers

Sec. 1 The President shall preside at all meetings of the Society, the Council of Trustees, and the Censors. He shall be ex-officio member of the Board of Censors and of all committees. He shall appoint all committees not otherwise provided for, subject to the approval of the Council of Trustees. He shall assign the special branches of work for which the members of the Council of Trustees shall be responsible, subject to the approval of the Council of Trustees. He shall also appoint all members of committees of this Council, subject to the approval of the Council of Trustees. The President shall deliver an address at the annual meeting of the Society. He shall perform such other duties as the House of Delegates or the Council of Trustees shall require.

Sec. 2 The President-Elect shall perform the duties of the President in the absence of the President. In the event of the President's death, resignation, removal, incapacity or refusal to act, the President-Elect shall succeed him.

Sec. 3 The immediate past President shall be a member of the Council of Trustees.

Sec. 4 The Speaker shall preside at all meetings of the House of Delegates. He shall appoint all parliamentary committees to serve during the meeting of the House of Delegates at least thirty days in advance of the meeting. All resolutions submitted by County Medical Societies and District Branches to be presented to the House of Delegates should be forwarded to the Speaker at least forty-five days in advance of the annual meeting of the House and referred by him to the appropriate Reference Committee.

Sec. 5 The Vice-Speaker shall perform the duties of the Speaker when requested by the Speaker to do so, or in case of the absence, death, resignation or refusal of the Speaker to act.

Sec. 6 The Secretary shall attend all meetings of the Society, the House of Delegates, the Council of Trustees, and the Board of Censors, and shall keep minutes of their respective proceedings. These minutes shall be copied from a stenographer's notes with such deletion only as will not modify, alter, or becloud the history of the actions of the said bodies. The stenographer's typewritten copy shall be preserved until ordered destroyed by the Council of Trustees.

The Secretary shall be responsible for and have general charge of the Society's offices and the employees therein. He shall be the custodian of the seal of the Society, and of all books of records and papers belonging to the Society, except such as properly belong to the Treasurer, and shall keep an account of and promptly turn over to the Treasurer all funds of the Society which come into his hands. He shall provide for the registration of the members at all sessions of the Society. With the aid and cooperation of the Secretaries of the County Societies, he shall keep a proper register of all the registered physicians of the State by counties. He shall aid the officers of the District Branches in the organization and improvement of the County Societies and the extension of the power and influence of the Society. He shall conduct the official correspondence, notifying members of meetings, Officers, Trustees and Board members of their election and committees of their appointment and duties. He shall affix the seal of the Society to all credentials issued to members of the Society elected by the House of Delegates and to such other persons

and documents as may require the same. He shall make an annual report to the House of Delegates. He shall supply each County Society with the necessary blanks for making their annual reports to this Society. Acting in cooperation with the Council of Trustees, he shall prepare and issue all programs. He shall be ex-officio a member of all boards and committees, without vote. He shall record the name and date of admission of each member of the Society.

Sec. 8 The Assistant Secretary shall aid the Secretary in the work of his office and in the absence or disability of the latter, he shall perform the duties of the office until the Secretary resumes the work, or in case of a vacancy until a successor shall be elected.

Sec. 9 The Treasurer shall keep accurate books of accounts of all moneys of the Society which he may receive, and shall disburse the same when duly authorized, but all checks drawn by the Treasurer upon the funds of the Society shall be countersigned by the Secretary of the Society. He shall collect, on or before the first day of June in each year, from the Treasurer of each component County Society the State per capita assessment. He shall at the expense of the Society give a bond for the faithful performance of his duties, which shall be approved by the Council of Trustees as to amount, form, and surety. He shall make an annual report to the House of Delegates and monthly reports to the Council of Trustees. He shall be a member of the Council of Trustees.

Sec. 10 The Assistant Treasurer shall aid the Treasurer in the work of his office, and in the absence or disability of the latter, he shall perform the duties of the office until the Treasurer resumes the work, or in case of a vacancy until a successor shall be elected. He shall, at the expense of the Society, give a bond for the faithful performance of his duties, which shall be approved by the Council of Trustees as to the amount, form, and surety. He shall be entitled to all the rights and privileges of the office while acting as Treasurer.

Sec. 11 Concerning substitutions in office

The Second Vice-President, the Assistant Secretary, the Assistant Treasurer and the Vice-Speaker shall serve as the First Vice-

President, the Secretary, the Treasurer and the Speaker, respectively, whenever these senior officers are incapacitated for service by injury, ill health of themselves or families, imperative professional duties, or by other mandatory absences. This shall be construed so as to include duty at or during meetings of the Council of Trustees, as well as the other official duties designated for the senior officer. The senior officer shall promptly notify the junior officer of his incapacity and request his attention to said duties.

Sec. 12 Each President of a District Branch shall visit the County Societies of his district at least once a year and make a careful inquiry of the condition of the profession in each county in his district and shall report thereon to the House of Delegates.

Chapter VII

Direction of Activities

Sec. 1 (a) An officer to be known as the Director of Activities shall be employed by the Society. He shall be a member of the Medical Society of the State of New York, who has established a reputation for executive ability, and who will give his full time and undivided attention to the affairs of the Society. He shall have been in actual practice for at least ten years or shall have qualifications which in the opinion of the Council of Trustees are equivalent to the same.

(b) The duties of the Director of Activities shall be as follows. He shall have general management of the executive details of the Society's business, subject to the Council of Trustees, he shall be the coordinator of all activities of the Society, he shall act as Secretary of the House of Delegates, of the Council of Trustees, and of the Board of Censors. Upon the signing of his contract with the Society, he shall automatically become the Secretary of the Society and assume all duties designated for the Secretary in Chapter VI, Section 6.

Sec. 2 An officer to be known as the Associate Director shall be employed by the Society. He shall assist the Director of Activities. He shall be a member of the Medical Society of the State of New York, who has established a reputation for executive ability and who will give his full time

and undivided attention to the affairs of the Society, subject to the direction of the Council of Trustees and the Director of Activities. He shall have been in actual practice at least seven years, or shall have qualifications which in the opinion of the Council of Trustees are equivalent to the same. Upon the signing of his contract with the Society he shall automatically become the Assistant Secretary of the Society.

Sec. 3 The terms of service of the Director of Activities and the Associate Director shall correspond with the administrative year of the Society: *i.e.* July 1 of one year to June 30 of the following year.

Chapter VIII

Meetings

Sec. 1 The notices of the annual and special meetings of the Medical Society of the State of New York, and its House of Delegates, and of regular meetings of the Council of Trustees, and the Board of Censors, shall state the date, place and hour and shall be mailed in securely post-paid wrapper to each member of the body holding such meeting at least seven days before said meeting. The affidavit of mailing by the Secretary of the Society to the last recorded address of the member shall be deemed sufficient proof of the service upon each and every member for any and all purposes.

Sec. 2 Each member in attendance at the annual or special meeting of the Society shall enter his name and the name of the component County Medical Society to which he belongs in a register to be kept by the Secretary of the Society for that purpose. No member shall take part in any of the proceedings of such a meeting until he shall have complied therewith.

Sec. 3 All members in good standing so registered may attend and participate in the proceedings and discussions of the general meetings of the Society and of the Sections.

Sec. 4 The following shall be the order of business at all general meetings of the Society

- 3 Reading the minutes of the last meeting
- 4 Miscellaneous business
- 5 President's address
- 6 Special addresses
- 7 Reading and discussion of papers

Sec. 5 Special meetings of the Society shall be called by the President upon the request in writing of two hundred and fifty members from the membership of at least ten component County Societies, and in case of the failure, inability or refusal of the President to act, such meeting may be called by a notice thereof subscribed by two hundred and fifty members.

Sec. 6 Special meetings of the House of Delegates shall be called by the Speaker upon the request in writing of sixty delegates, or at request of the Council of Trustees, and in case of the failure, inability or refusal of the Speaker to act, such meetings may be called by a notice thereof subscribed by sixty delegates.

Chapter IX

Expenses

Sec. 1 Allowances for expenses incurred in the actual performance of official duties by officers, members of the Council of Trustees, Board of Censors, and committees, and delegates to the American Medical Association shall be made in conformity with the following conditions. The President shall be allowed a *per diem* and expenses when engaged upon official business. All other officers shall be allowed travelling expenses when engaged upon official business. Members of the Council of Trustees and of the Board of Censors, shall be allowed travelling expenses. Members of committees of the Council of Trustees, and of all special committees of the society, shall be allowed travelling expenses. There shall be no allowance made for the expenses, travelling or otherwise, for any committee appointed pursuant to Chapter X of these By-Laws. Proper vouchers must be filed with the Secretary and approved by the Council of Trustees before any of above allowances are made. The delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the Secretary evidence of

- 1 Calling the Society to order

- 2 Address of welcome by the Chairman of the Committee on Arrangements

such attendance shall be allowed the actual cost of railroad transportation and Pullman accommodations to the place of meeting and return. The vouchers of such expense shall be approved by the Council of Trustees before payment. Each District Branch shall be entitled to receive a sum not to exceed \$200.00, exclusive of the work done by the Secretary regarding notices, programs, etc. to defray the expenses of holding the annual meeting of such District Branch, provided a proper statement of such expense shall have been presented to the Secretary and approved by the Council of Trustees. All bills, claims or vouchers herein provided for shall be filed within thirty days after the date of the incurring of such expense. This time may be extended for any cause by the Council of Trustees and such extension shall not exceed ninety days.

Chapter X

Reference Committees

Sec 1 At least one month before the meeting of the House of Delegates the Speaker shall appoint and publish in the Journal such Reference Committees as he shall deem expedient for the purposes of the meeting. Immediately after the organization of the House of Delegates he shall formally announce the appointments of the Committees. Only members of the House of Delegates are eligible for appointment on the Reference Committees. Such Committees shall consist of five members, three members constituting a quorum, and shall serve during the meeting for which they are appointed.

Sec 2 Reports of Officers, Council of Trustees, and Committees shall be printed at least one month before the meeting of the House of Delegates and sent to the members of the Reference Committee appointed according to Section 1, for their preliminary consideration. All recommendations, resolutions, measures, and propositions presented to the House of Delegates and which have been duly seconded shall be referred by the Speaker to the appropriate Reference Committees.

Sec 3 Each Reference Committee shall immediately consider such business as may have been referred to it and shall report promptly to the House.

Chapter XI

Special Committees

Sec 1 Special Committees may be created by the House of Delegates to perform the special functions for which they are created. They shall be appointed by the officer presiding over the meeting at which the committee is authorized, if such committee is to conclude its work during said meeting of the House of Delegates. The President shall appoint all other committees subject to the approval of the Council of Trustees unless otherwise ordered by the House of Delegates.

Sec 2 A Special Committee on Prize Essays consisting of three members, including the Chairman, shall be appointed by the President with the approval of the Council of Trustees. Its duty shall be to receive all essays offered in competition for prizes which may be offered by this Society. The Committee shall make all necessary rules and regulations for the award of prizes subject to the terms of the deeds of gift, and shall report the result at the next annual meeting of the House of Delegates. It shall give notice through the Society's publication or by other methods within thirty days after appointment, of the amount of the prize and when the essays shall be submitted to the Committee.

Sec. 3 Any member of the Society shall be eligible to serve on Special Committees. All members of such committees, who are not members of the House of Delegates, shall have the right to present their reports in person to the House of Delegates and to participate in the debate thereon, but shall not have the right to vote.

Chapter XII

Sections

Sec 1 The Scientific Sections designated by the House of Delegates shall each organize by the election of a Chairman and Secretary. The Chairman shall be elected annually, the Secretary for such term as the Section may deem fit.

Sec 2 The officers of the various Sections shall prepare programs for their Sections under the direction and subject to the approval of the Council of Trustees.

Sec. 3 The election of officers of Sections

shall be the first order of business of the first session of the second day of each annual meeting To participate in the election of any Section, a member must be registered with such Section and must have recorded his name and address in the Section registry

Sec. 4 Each Section shall hold its meetings at such times as designated by the Council of Trustees

Chapter XIII

District Branches

Sec. 1 Each District Branch shall elect a President for two years, who shall be a District Delegate of the House of Delegates during his term in said office.

Sec. 2 Each District Branch shall elect such officers as are provided for in its By-Laws, who shall attend the business meetings of the Branch

Chapter XIV

Component County Medical Societies

Sec 1 (a) Eligibility for membership in County Medical Societies shall be determined by the Boards of Censors or Comitia Minora of the County Medical Societies Except by approval of the Council of Trustees of the Medical Society of the State of New York, no physician shall be an active member in a County Medical Society other than that of the county in which he maintains legal residence, or has his principal office

(b) In order that a member desiring to correct his membership pursuant to the terms of this section shall have an opportunity to do so without impairing his status as an active member, a period of six months from the date of the adoption of this section must elapse before the Board of Censors or the Comitia Minora of any County Medical Society shall have the right to declare a member ineligible by reason of the fact that he neither maintains a legal residence or has his principal office in the jurisdiction of the County Medical Society of which he is then a member

Sec 2 Whenever an active member in good standing in any component County Medical Society removes to another County in this State, his name, upon his request,

shall be transferred to the roster of the component County Medical Society of the County to which he removes, without cost to him, provided that he files a certificate with the Secretary signed by the President and Secretary of the component Society from which he removes as to his good standing in such Society No member, however, shall be an active member of more than one component County Society, nor shall any component County Society accept a physician residing in another County in any other way than in accordance with the law governing transfers

When a member in good standing ceases to reside and practice in the State of New York he shall *ipso facto* cease to be a member of the Society and of his component County Medical Society His status shall be deemed that of a resigned member and all rights and title to any share in the privileges and property of the Society, the District Branch, or County Society, shall be deemed to have been forfeited by such action

The dues of any member of the Medical Society of the State of New York may be remitted for the current year on account of illness when the request is made by the member's component County Medical Society

Sec. 3 At its annual meeting each component County Medical Society shall elect a delegate or delegates to represent it in the House of Delegates of this Society in accordance with the Constitution and By-Laws of this Society

Sec 4 The Secretary of each component County Medical Society shall keep a roster of its members in which shall appear the full name of each of said physicians, the date of his admission to such society, his residence, and the date when his license to practice medicine in this State was granted He shall note any changes in said roster by reason of removal, death or change of name, revocation of license or other disqualification

He shall forward said roster and information, together with the names and places of residence of each of the officers of said society and the names and residence of each delegate of the House of Delegates of said society to the Secretary of this Society sixty days before the date of its annual meeting

Sec. 5 The Treasurer of each component County Medical Society shall forward to the Treasurer of this Society the amount of the State per capita assessment on or before the first day of June of each year

Sec. 6 Each component County Medical Society shall adopt a Constitution and By-Laws for the regulation of its affairs and may amend the same provided they shall be first approved by the Council of Trustees before becoming effective. The Constitution and By-Laws of component County Societies must not be in conflict with the Constitution and By-Laws of this Society

Chapter XV

Miscellaneous

Sec. 1 No address or paper before the Society, except those of the President and orators, shall occupy more than twenty minutes in its delivery, and no member shall speak upon any question before the House of Delegates for longer than five minutes nor more than once on any subject, except by the consent of a majority vote

Sec. 2 All papers read before the Society by its members shall become the property of the Society. Permission may be given, however, by the Council of Trustees or House of Delegates to publish such paper in advance of its appearance in the *NEW YORK STATE JOURNAL OF MEDICINE*

Sec. 3 Any distinguished physician of a foreign country or a physician not a resident of this State, who is a member of his own State Association, may become a guest during any annual session upon the invitation of the President or officers of the Society, and may be accorded the privilege of participating in all the scientific work of the session

Sec. 4 The rules contained in Robert's Rules of Order shall govern the Society and the House of Delegates in all cases in which they are not inconsistent or in conflict with the Constitution and By-Laws of the Society or the standing or special rules of the House of Delegates

Sec. 5 Written charges may be preferred against any officers, Trustees, and members of Boards and Special Committees of the Society, for malfeasance or nonfeasance in office, by any member and transmitted to the

President. The President shall order a trial upon said charges by the Council of Trustees, or a Committee thereof, and in the event of such trial the accused shall be given at least ten days' notice of such charges and have full opportunity to defend the same, but no such officer or member of the committee shall be removed or otherwise disciplined except by a two-thirds vote of the Council of Trustees. In case any such officer, or trustee, or member of a board or committee shall be removed, he may appeal from the decision of the said Council of Trustees to the House of Delegates, but pending the determination of such appeal, he shall not exercise the functions of his office.

Sec. 6 Sections of the By-Laws which refer to the order of business and to reference committees may be suspended by a two-thirds vote of the House of Delegates

Chapter XVI

Sec. 1 The seal of the Society shall be as follows

Chapter XVII

Amendments

Sec. 1 Amendments to these By-Laws, except such as are obligatory by law, shall be made only at an annual meeting of the House of Delegates

Sec. 2 Notice of the proposed amendment shall be given at a previous annual meeting of the House of Delegates, and before the same can be acted upon it shall be published once before the annual meeting in the official bulletin or journal of the Society

Sec. 3 The affirmative vote of two-thirds of the House of Delegates present and voting shall be necessary for adoption.

Sec. 4 Amendments made necessary by law shall be made either by the Council of Trustees or House of Delegates whenever such necessity exists

O. W. H. MITCHELL, *Chairman, Syracuse*
WALTER W. MOTT, *White Plains*
CHARLES H. GOODRICH, *Brooklyn*
THOMAS H. CUNNINGHAM, *Glens Falls*
JOSEPH C. O'GORMAN, *Buffalo*

REPORT OF BOARD OF CENSORS

To the House of Delegates, Gentlemen

There has been held during the year one session of the Board of Censors of the Medical Society of the State of New York

The Board convened in the offices of the State Society, New York City, on December 10, 1936, to hear the Appeal of Drs Thomas F Draper and F Raymond Surber against the action of the Medical Society of the County of Queens suspending them from the rights and privileges of membership for a period of six months from October 27, 1936

The following Censors were present Terry M Townsend, Bertran W Gifford, John P J Cummins, Leo P Larkin, and Thomas W Maloney, Floyd S Winslow, presiding, Peter Irving, Secretary

The appellants appeared in person without counsel, the respondent was represented

by James M Dobbins, President, and Herbert L Langer, Chairman of the Board of Censors of the Medical Society of the County of Queens Mr Thomas H Clearwater acted as Legal Advisor for the Board of Censors

All evidence presented was carefully considered and in particular, additional evidence in the form of three letters which had been received by the appellants subsequent to the action of the County Society imposing suspension

The Board of Censors unanimously resolved

That this matter be referred back to the Board of Censors of the Medical Society of the County of Queens for reconsideration with the additional evidence that has been submitted to this Board

Respectfully submitted,

PETER IRVING, M D, *Secretary*

April 1, 1937

REPORT OF COMMITTEE ON MEDICAL TRENDS

To the House of Delegates, Gentlemen

The work of the Committee on Medical Trends during the last year has been confined to the supervision of the activities of the Public Relations Bureau, which was instituted January 15, 1935. At the close of a year spent in presiding over the destinies of a pioneer effort in the interpretation of the medical profession to the public, the committee wishes to express its deep obligation to Dr James F Rooney, who inspired the installation of the Public Relations Bureau and who, as the first chairman of the committee, guided it through the dangerous shoals of its first year of activity

As constituted at present the committee comprises the chairmen of each of the standing committees of the society, plus three additional members chosen for their special ability to be of help in this type of work. The committee comprises Drs Terry M Townsend as Chairman, Augustus J Hambrook, Frederic E Elliott, Homer L Nelms, William A Groat, Thomas P Farmer, Leo F Simpson, Samuel J Kopetzky, David B Jewett, and George W Kosmak.

The committee held four meetings during the year. A sub-committee consisting of the members residing in New York and Brooklyn met once. At several meetings we have had the advantage of the presence and assistance of Dr Floyd S Winslow, president of the society, Dr Charles H Goodrich, president-elect, and Dr Peter Irving, secretary. Dr Charles Gordon Heyd and Dr Nathan B Van Etten were called upon to advise us from time to time.

Summarizing the work of the bureau in terms of pieces of mail matter sent out during the year, we beg to report a total of 2,630 personal letters dictated and mailed, 8,500 mimeographed news releases, 21,968 mimeographed copies of installments of the "Do You Know?" column for weekly newspapers in New York State, reprints of articles, news items, editorials, numbering 122,260.

The news releases have had for their subject matter pneumonia control, district branch meetings, postgraduate courses under the auspices of the Committee on Public Health and Medical Education, and compulsory health insurance.

Editorials appearing in the New

YORK STATE JOURNAL OF MEDICINE were sent specially to editors of important journals in several instances "The Lull Before the Storm" and "Anent the Quality of Medical Care" went to daily newspaper editors, medical journal editors, and to a selected list of nationally important physicians, receiving much favorable comment "Labor and Social Security" was sent to editors of labor and insurance journals, "Cooperation from Understanding" to editors of legal journals A surprising amount of comment was elicited The paper entitled "The Stutter-Type Personality and Stuttering" by Dr James Sonnett Greene, appearing in the JOURNAL of May 15, 1936 was sent to the editors of daily newspapers

In explanation of adding journals as well as individuals outside the state of New York to our list it should be said that the committee has found that in rapidly changing times the propagation of the ideas of organized medicine transcends state lines, persons in New York may read insurance journals published in Philadelphia, the physician in New York who desires information, is not fully informed unless the physician in St Louis whom he may encounter at the next medical meeting is informed, too For this reason, certain releases of high importance are sent to journals of national circulation published outside the state of New York, and also for this reason, the committee has authorized adding to our mailing list leaders of medical thought throughout the country to the number of approximately 500 The type of material sent this list is exemplified by the mailing to them of the leading article in the Herald-Tribune on the Social Security Board's project for health insurance and Dr Winslow's reply the following day, published in the same paper

Through the courtesy of Mr Gardiner of the NEW YORK STATE JOURNAL OF MEDICINE, copies of the medical directory were made available to the editors of all daily and weekly newspapers in the state A letter was sent them explaining how this volume could be made useful

Four mimeographed bulletins were issued during the year with the following titles "Political Activity," "Is The Public To Be Trusted?" "Handwriting

on the Wall," and "Propaganda as a Social Force" These bulletins were issued for the information of the medical profession on subjects connected with their relations with the public They went to a selected list of physicians within and without the state The total number of bulletins distributed was 2,400

The committee employed Mr J Weston Walch of Portland, Maine, to prepare a manuscript entitled "On The Witness Stand—The Evidence Against Compulsory Health Insurance" A total of 90,000 copies were printed in October 1936, of which 3,000 were used in promotion and educational work, 15,000 were mailed to the members of the state medical society, and the balance were sold to organizations and societies throughout the country in small and large quantities, from coast to coast The supply was exhausted in March 1937, and 30,000 additional copies were ordered, 10,000 of which were sold before publication A fair profit was made on these sales above the cost of production which operated to reduce the expense entailed in the copies used for free distribution to editors and publicists in New York State, and to our own members

The committee also employed Dr Frederick L Hoffman, statistician, of Philadelphia to prepare four articles making a comparison of vital statistics in the United States with those of foreign countries where compulsory health insurance is in operation The articles were published in *The Weekly Underwriter* of New York City, issued in pamphlet form in March 1937, by the bureau, and offered on sale throughout the country in quantities The edition of this pamphlet was 20,000 Before publication 750 of these were sold outside of New York State

As distinguished from material which is sent out for publication the Public Relations Bureau mails certain material directly to important persons within the state of New York Among documents so mailed have been Dr Winslow's article in the *Survey*, "Partners in Public Health" and his addresses reprinted from *Vital Speeches of the Day*, "We Do Not Want Security" and "Why Do We Have Medical Ethics?" as well as a reprint of his article in the NEW YORK STATE JOURNAL

OF MEDICINE, "Why Am I A Doctor?" Two of his contributions to local Rochester newspapers, "The Doctor and The Public" and "My Idea of The Best Doctor" were mailed to this list "Whither Medicine?" by Dr Terry M Townsend and "The Doctor of Tomorrow" by Dwight Anderson were similarly distributed

Occasional reprints from the NEW YORK STATE JOURNAL OF MEDICINE are from time to time distributed to publications and persons likely to be interested specially in the subject matter "The Medical Witness" by Hon Meier Steinbrink was thus sent out, as were "Clinical Aspects of Pneumococcus Pneumonia," and "Reduction of Mortality from Pneumococcus Pneumonia" by Dr Peter Irving, published in *Preventive Medicine*

Many journals have reprinted speeches of Dr Winslow and Dr Townsend in full, or quoted from them. References have been freely made to other releases from the bureau. These publications and comments on them, as well as newspaper clippings showing the use of our releases to the press, are kept in scrapbooks at the office of the Public Relations Bureau and form a chronological detailed record of the activities of the bureau

In addition to the use of our material in the daily and weekly press of the state, editorial comments have appeared in the following journals

Journal of the American Medical Association
West Virginia State Medical Journal
Southern Medicine and Surgery
Journal of the Tennessee State Medical Association
Neighborhood Health (Dept of Health publication)
Illinois Medical Journal
Clinical Medicine and Surgery
Digest (Syroense General Hospital publication)
New York Medical Week
New England Journal of Medicine
Tulane Academy of Medicine Bulletin
Journal of the Indiana Medical Association
Bulletin of the Chicago Dental Society

Pittsburgh Medical Bulletin
Journal of the Medical Society of New Jersey
California and Western Medicine
The Labor Union
Cincinnati Academy of Medicine Bulletin
Modern Medicine
The Survey
Medical Pocket Quarterly

Many requests have come from physicians throughout the country to be placed on our mailing list and a number of letters have been received commenting favorably on the type of service rendered by the bureau

Several invitations to speak before county medical societies concerning the work of the committee have been accepted. The chairman, together with the director of the Public Relations Bureau, spoke at a meeting of the Bronx County society, October 21, 1936, and the Tompkins County society at Ithaca, November 19, 1936. They also went to Chicago, September 24, 1936, at the request of the trustees of the American Medical Association

Mr Dwight Anderson, director of the bureau, spoke to a group of students at New York University on the subject of sickness insurance, November 24, 1936, and addressed the annual meeting of the Monroe County society, December 15, 1936, on the subject "The Doctor of Tomorrow." Mr Anderson accompanied a group to Chicago, November 16, 17 and 19 as an unofficial observer at a meeting of state secretaries and editors of medical journals

Since the last report, Mr Anderson has attended the A M A meeting at Kansas City, and has also made necessary trips to Saratoga Springs, Philadelphia, Albany, Buffalo, Rochester, and Ithaca. He has attended a number of meetings, luncheons, and conferences of lay persons, as well as most of the regular meetings of the standing committees of the society

The bureau arranged for a meeting to hear Dr. Kingsley Roberts speak on the cooperative movement, and arranged for the attendance of representative physicians at a special committee meeting of the Association of the Bar.

Requests have come from neighboring state and county medical societies for explanation of the work the committee is doing and for help in establishing similar public relations bureaus. Your chairman, as well as the director of the bureau, has offered what assistance was possible in response to these requests and in every instance the physicians making such applications have been placed on the mailing list to receive our material.

Since the last report to the House of Delegates, 15,632 names have been added to our stencil list, making a total of 22,882 stencils. By an ingenious system of keying, we are able to operate our addressing machinery, mailing certain pieces of mail matter only to groups most interested. The list now comprises two types of names, those to receive releases or other material to be republished by the recipient, and individuals who are sent printed matter for their own reading. To summarize briefly headings under which these names are grouped: Editors and chief editorial writers of daily newspapers, principal department editors, newspaper syndicates, weekly newspapers, special lists to receive material on socialized medicine, pneumonia, and bulletins, county and state society presidents and secretaries, council and section officers, AMA delegates and trustees, medical journals, health columns, agricultural, collegiate, fraternal, industrial, labor, foreign language publications, general publications, health department, religious and welfare, miscellaneous publications, picture services, house organs, hospitals and nurses publications, chamber of commerce, dental, philanthropic and humanitarian, insurance and educational publications, health commissioners, N. Y. State legislators, Workmen's Compensation Board, N. Y. County Lawyers Association and Bar Association, Rotary and Lions Clubs, chambers of commerce, YMCA and social workers, associations and societies, tuberculosis associations and tuberculosis society publications, libraries, dentists,

teachers, delegates to the state society, orthodontists, key persons sent in by the county societies, key lay persons named by delegates, preachers and influential churchmen, labor union leaders, farmers.

Our mechanical equipment consists of these stencils, an addressing machine, stencil cutter, mimeograph machine and folding machine, all operated electrically, and an envelope sealer and stamping machine operated by hand.

Conferences and interviews have been had from time to time with editors and writers. Part of the function of the Public Relations Bureau is to stimulate ideas to bear fruit elsewhere. These activities are of such a character that the results usually appear quite dissociated from any reference to the bureau. The members of the committee, and especially the chairman, are in close touch with the activities in this respect which are conducted by the director, and without going into details in this report it is their belief that this part of the work is well conducted and productive of results. One such item may be mentioned in passing. The bureau supplied information for an editorial in the March 1937, issue of "The Nation's Business" and for a complete article to appear in the May number entitled "Uncle Sam, M. D."

As this report is written the Public Relations Bureau is about to inaugurate a "Speaker's Service." This service will supply ideas for stated talks before meetings and will also study and present from time to time suggestions for assisting the doctor in influencing those whom he meets at club, church, or in his usual casual day by day contacts. It is one of the doctor's obligations to society to make his views known on matters of a quasi-medical nature which come to the public's attention and involve their health. Heretofore the doctor has failed to be as vocal as he might become, without loss of dignity or prestige. He has had neither the time to develop the faculty nor the technic to use it. The speaker's service will not undertake to bring speakers and audiences together. This is a task which must be done locally with reference to conditions with which a centralized bureau could not be conversant.

The committee recommends to the

House of Delegates that it pass a resolution calling upon each county medical society to appoint a special committee of not more than three members to co-operate locally with the Committee on Medical Trends of the society in the furtherance of the speaker's service project

The Committee on Medical Trends, from the response which it has received from its efforts so far, feels confident that health insurance can never be foisted upon the American people if every man and woman in the country knows the facts. With the machinery which has been perfected by the Public Relations Bureau an adequate presentation can be made in New York State so that no in-

telligent person will have failed to have an opportunity to be informed. The work which is in progress in this state, by the very fact that we are known to be adequately prepared to meet such issues, may have an important bearing on the promotion of inimical proposals both in their state and national aspects.

It is felt that we are approaching the time when the physician will in fact exert in his community the influence which is already his, but which has remained an inert force through lack of coordinated planning to make it kinetic.

Respectfully submitted,

TERRY M TOWNSEND, *Chairman*

April 1, 1937

REPORT OF COMMITTEE ON MEDICAL RESEARCH

To the House of Delegates, Gentlemen

In behalf of your Committee on Medical Research, I have the honor to present the following report

Mr Doyle again presented his annual antivivisection bill, Assembly Int #1285. There was no new feature in this bill. It was designed to prevent experimentation on the living dog. The bill was referred to the Public Health Committee.

Many of the members of this Committee have been contacted previously on bills of this nature. They recognize that the present state laws covering experimentation on animals are carefully drawn up so that adequate safeguards are provided for this work. Animals must be treated with as much care and considera-

tion as humans under the terms of our present laws. Animal experimentation must be continued if medicine is to make new discoveries. The interests of the public health would be endangered by restrictions placed on animal experimentation.

Up to the present time no action has been taken on the Doyle bill. It does not seem likely that the bill will receive favorable consideration.

Your chairman wishes to thank the members of the Committee on Medical Research for their cooperation in carrying out the annual program.

Respectfully submitted,

JOHN J MORTON, *Chairman*

April 1, 1937

REPORT OF THE COUNSEL

To the House of Delegates, Gentlemen

Your counsel herewith submits his Report of activities of the Legal Department of the Medical Society of the State of New York for the period from February 1, 1936 to and including January 31, 1937.

This has been an exceedingly busy year both in court and in consultation. The appended figures while they give some indications of the amount of work done do not adequately portray the details of the work that has been accomplished,

nor do they give any adequate picture of the responsibility assumed by our Department. A report must necessarily state only conclusions.

At the outset of this report your Counsel wishes to record his appreciation for the assistance and cooperation furnished him by your officers and committeemen. The problems confronting organized medicine today are many, varied, and complex. The solution of these problems involves an immense amount of work and your officers and committeemen are to be

congratulated on their industry and loyalty on behalf of the membership of your Society

In making his report your Counsel adheres to the convenient category employed in previous years whereby his activities have been divided into three main divisions (a) The actual handling of malpractice actions before courts and juries and in the Appellate tribunals, (b) counsel work with officers, committees, and individual members of the Society, and (c) legislative advice and activities

Litigation

In his report last year your Counsel said "It is pertinent at this point to make mention of the fact that careless, hasty, and unjustified criticism by one physician concerning the work of another often leads to the commencement of a malpractice action. Your Counsel believes that such unjustified criticism is not often deliberately made but frequently the effect on the patient is precisely the same as if the criticism were motivated by malice"

We feel that this admonition will bear repeating. It is difficult enough to contend with the forces outside our organization without adding the element of disunion from within.

So far as the hazard of a malpractice action to the practicing physician in this State is concerned, little need be said. It is ever present and we wish to repeat and emphasize the fact that the physician's rights so far as the facts of the case are concerned rest entirely in the hands of a lay jury. Bias, prejudice or passion have no proper place in the jury box. This is true in theory, but in practice, unfortunately, the very opposite is often true as anyone familiar with the courts can testify.

The realization of this situation led your representatives many years ago to organize the present group plan. The justification for this plan as well as its successful operation are matters of record. It affords to your membership an opportunity to insure themselves in adequate amounts, thus eliminating the financial hazard of a malpractice action.

For many years in these reports we have had occasion to make mention of

the splendid work in the field of litigation of your Counsel's associate, Mr. William F. Martin. It is with pleasure that we do so again in this report. Mr. Martin is a man of splendid character and one whose abilities as an advocate have won for him expressions of approval from judges, lawyers, and doctors throughout the State.

Your Counsel also wishes to note the splendid work done by his associate, Mr. Thomas H. Clearwater, the Attorney for the Society. Through the years Mr. Clearwater has been in close contact with your officers and committeemen and with many individual members of your Society. Your Counsel wishes to record with appreciation Mr. Clearwater's excellent work in connection with the many problems that are before us for consideration and solution.

Your Counsel feels that he should not leave this subject without mention of the splendid spirit of industry, loyalty, and devotion manifested by your Counsel's entire staff, both legal and clerical.

With this preliminary statement we note that there were commenced in the present *twelve-month* reporting period 184 actions as against 185 actions reported during the previous reporting period which covered a period of *eleven months*. It thus appears that in the past *twelve months* one less case was commenced than in the previous *eleven-month* period. This is an encouraging sign. These figures do not, of course, include a number of claims outstanding in which suit may ultimately be brought. Throughout the year your Counsel has been in conference and consultation with many claimants and their attorneys and frequently we have successfully demonstrated to them that in fact and in law no valid claim exists.

The Table of Comparisons appended hereto shows that we disposed of in *twelve months* 251 cases as against 208 cases disposed of during the previous *eleven month* reporting period. Of the 251 cases disposed of during the reporting period, forty-seven cases were settled and 199 actions have been successfully terminated in favor of the physician, either by judgment rendered in his favor or by discontinuance or abatement. In five cases judgments were rendered in favor of the plaintiff.

Of the cases in the Appellate Courts we were successful in three and unsuccessful in one

We note from Table I that there were pending as of January 31, 1937, 535 cases as against 602 cases pending January 31, 1936

At this point it is pertinent to say that litigation and insurance protection are inextricably interwoven. From our experience we can assert without hesitation that no physician can practice his profession in this State with peace of mind unless he has taken the precaution to insure himself in adequate limits against the ever present possibility of legal action being taken against him

The State Society has an Insurance Committee which works in cooperation with your Counsel and with your authorized insurance representative, Harry F. Wanvig, and this Committee considers

and passes on, in the first instance, all problems that may arise in the operation of your group plan

Table II gives a comparison of the number of members insured in 1934, 1935, 1936, and 1937 and the number of members in the County Societies and the percentage of insured members in the County Societies and in the entire State Society

Counsel Work

During the period of this report your Counsel prepared for the Society's JOURNAL articles in the nature of editorial comment. These articles have included the following:

Malpractice—Treatment of Fractured Hip

Malpractice—Action barred by Release
Healer found Guilty of Illegal practice of Medicine

TABLE I
COMPARISON OF THE NUMBER OF SUITS INSTITUTED AND DISPOSED OF IN 1935-1936 AND 1936-1937

	Instituted		Disposed of	
	1935-1936 (11 months)	1936-1937 (12 months)	1935-1936 (11 months)	1936-1937 (12 months)

congratulated on their industry and loyalty on behalf of the membership of your Society

In making his report your Counsel adheres to the convenient category employed in previous years whereby his activities have been divided into three main divisions (a) The actual handling of malpractice actions before courts and juries and in the Appellate tribunals, (b) counsel work with officers, committees, and individual members of the Society, and (c) legislative advice and activities

Litigation

In his report last year your Counsel said "It is pertinent at this point to make mention of the fact that careless, hasty, and unjustified criticism by one physician concerning the work of another often leads to the commencement of a malpractice action. Your Counsel believes that such unjustified criticism is not often deliberately made but frequently the effect on the patient is precisely the same as if the criticism were motivated by malice."

We feel that this admonition will bear repeating. It is difficult enough to contend with the forces outside our organization without adding the element of disunion from within.

So far as the hazard of a malpractice action to the practicing physician in this State is concerned, little need be said. It is ever present and we wish to repeat and emphasize the fact that the physician's rights so far as the facts of the case are concerned rest entirely in the hands of a lay jury. Bias, prejudice or passion have no proper place in the jury box. This is true in theory, but in practice, unfortunately, the very opposite is often true as anyone familiar with the courts can testify.

The realization of this situation led your representatives many years ago to organize the present group plan. The justification for this plan as well as its successful operation are matters of record. It affords to your membership an opportunity to insure themselves in adequate amounts, thus eliminating the financial hazard of a malpractice action.

For many years in these reports we have had occasion to make mention of

the splendid work in the field of litigation of your Counsel's associate, Mr. William F. Martin. It is with pleasure that we do so again in this report. Mr. Martin is a man of splendid character and one whose abilities as an advocate have won for him expressions of approval from judges, lawyers, and doctors throughout the State.

Your Counsel also wishes to note the splendid work done by his associate, Mr. Thomas H. Clearwater, the Attorney for the Society. Through the years Mr. Clearwater has been in close contact with your officers and committeemen and with many individual members of your Society. Your Counsel wishes to record with appreciation Mr. Clearwater's excellent work in connection with the many problems that are before us for consideration and solution.

Your Counsel feels that he should not leave this subject without mention of the splendid spirit of industry, loyalty, and devotion manifested by your Counsel's entire staff, both legal and clerical.

With this preliminary statement we note that there were commenced in the present *twelve-month* reporting period 184 actions as against 185 actions reported during the previous reporting period which covered a period of *eleven months*. It thus appears that in the past *twelve months* one less case was commenced than in the previous *eleven-month* period. This is an encouraging sign. These figures do not, of course, include a number of claims outstanding in which suit may ultimately be brought. Throughout the year your Counsel has been in conference and consultation with many claimants and their attorneys and frequently we have successfully demonstrated to them that in fact and in law no valid claim exists.

The Table of Comparisons appended hereto shows that we disposed of in *twelve months* 251 cases as against 208 cases disposed of during the previous *eleven month* reporting period. Of the 251 cases disposed of during the reporting period, forty-seven cases were settled and 199 actions have been successfully terminated in favor of the physician, either by judgment rendered in his favor or by discontinuance or abatement. In five cases judgments were rendered in favor of the plaintiff.

Plaintiff's Burden of Proof
 Practice of Medicine by a Corporation
 Malpractice—Ether burn of Eye
 Physician and Patient—Physician's action for Compensation
 Physician and Patient—The Value of Professional Services
 Practice of Medicine without License
 Physicians and Surgeons—An interesting Fracture Case
 Malpractice—Death of Alcoholic under Anesthesia
 Discipline of Advertising Physician
 A Very Unusual Surgical case
 Malpractice—Plaintiff's failure to Prove Negligence
 Physicians and Surgeons—Liability for negligence of another Physician
 Insurance—Overdose of Drug as Accidental cause of Death
 Physicians—Compensation—Requirement of License
 Evidence—Demonstration by Medical Witness
 Limitation of Actions against a Physician
 Physician and Patient—Fee of Consultant
 Malpractice—Liability of Eye Specialist
 Privileged Communications—Dentists

Your Counsel has also digested and there have been published in the STATE JOURNAL case reports upon malpractice actions which it has been felt were of special interest to the members of the profession. The case reports which were published during the previous year are as follows

Removal of Superfluous Hair
 Complaint concerning Prescription for Dermatitis
 Claimed Negligence upon Death of Fetus
 Accidental Burn during Diathermy Treatment
 Treatment of Lymphosarcoma
 Plastic Operation upon Nose
 Claimed infection following Diphtheria Injection
 Redness following Diathermy Treatment
 Death following Cesarean Operation
 Needle Breaking Case
 Death from Gangrene following Infection of Toe
 Treatment of Phagedenic Ulcer
 Claim of Negligence in administering Injections
 Amputation of Leg
 Death following Herniotomy
 Claimed Improper Examination
 Treatment of Pruritus Ani
 Treatment of Infected Index Finger
 Alleged Improper Physical Examination

Fecal Concretion confused with Rubber Tube
 Treatment of infected Thigh
 Accident during Application of Acid
 Death following Removal of Stone from Ureter
 Mass on Tongue
 Treatment of Neuritis
 Alleged Illegal Commitment
 Extraction of Teeth
 Broken Needle in Leg

It is pleasing for your Counsel to learn from the members of your Society throughout the State that they enjoy reading these reports and articles and that they find them to be interesting and instructive

In addition to his other duties your Counsel receives frequent requests for opinions, orally and in writing, on various topics. Some of the matters upon which advice has been given (in writing) are the following

1 Inquiry from a doctor as to the advisability of and legality of a list of delinquent debtors to be compiled by the various members of a County Medical Society

2 Inquiry as to whether a physician can discharge himself from responsibility for making further calls upon a patient who has refused to pay the physician's charges to date

3 Inquiry as to the following matters concerning the administration of anesthesia in hospitals

(a) Liability arising from an anesthesia accident when a nurse anesthetist administers the anesthesia when there is no doctor as director and instructor in anesthesia.

(b) Liability arising from an anesthesia accident where a nurse anesthetist administers the anesthesia where a doctor is designated as director and instructor in anesthesia but at the time of the accident is not present

(c) Liability arising from an anesthesia accident where a nurse anesthetist administers an anesthesia in the presence of a doctor appointed as director and instructor in anesthesia

4 Inquiry on behalf of the physicians on the staff of a not-for-profit hospital in the attempt to obtain a solution to the following problem. A Municipal appropriation of a substantial sum of money was made to compensate the physicians at the hospital for the care of the public poor. The City Treasurer claimed he could not pay individual physician's bills from the fund and the physicians sought an appropriate legal method of disbursing the money set aside from the purpose of compensating physicians which would not involve having the hospital act as paymaster

TABLE II

in addition to an anesthetist to be present at the performance of a major operation?

(b) Can a nurse in the absence of a contrary hospital regulation, legally take the place of an assistant surgeon at the performance of an operation?

(c) Is a trained nurse entitled to administer an anesthesia, either in or out of a hospital?

25 Inquiry from a physician specializing in surgery as to forms for consents for operations

26 Inquiry from a physician for advice with regard to the following problem: A food handling company referred a prospective employee for examination to ascertain whether he suffered from a venereal disease. The examination revealed the presence of such disease. The physician questioned the advisability of reporting such information to the company.

27 Inquiry from a doctor as to whether two years after treatment has been terminated he can sue a patient for his unpaid bill without danger of being subjected to a malpractice suit.

28 Inquiry from a physician as to the length of time following treatment within which a patient is entitled to sue a doctor for malpractice.

29 Inquiry from a physician as to whether he could be required to reveal confidential information concerning welfare patients before he could enforce payment of his bill for such services.

30 Inquiry from a physician specializing in surgery as to whether it is proper for him to operate upon a patient making use of a nurse anesthetist.

Szold v Outlet Embroidery Company

A case of great importance to the State Society in connection with the operation of the Workmen's Compensation Law, as recently amended, came before the Court during the reporting period. In this case a physician brought suit against an employer to recover for medical services rendered to an injured workman of the employer, who had been injured in the course of his employment and thus came within the provisions of the Workmen's Compensation Law. The suing physician had not been authorized to render compensation medical care as required by the 1935 amendments to the Statute. It was the contention of the attorney for the physician first, that this amendment could not deprive the physician of his common law right to sue for

services rendered, and second, if the amendments attempted to do so it was unconstitutional.

The question involved in this case was vital to organized medicine for this action struck at the very foundation of the recent amendments to the Workmen's Compensation Law.

Your Counsel, on behalf of the Society, applied for and obtained permission from the Court to file a brief as amicus curiae. Cooperation was also secured from the attorneys for the State Insurance Fund and also from the Attorney General's office.

Mr Justice Shientag of the Supreme Court of this State in a carefully reasoned decision upheld our contentions and decided the case against the physician. The substance of his opinion was published in the July 1, 1936 issue of the STATE JOURNAL. From his decision an appeal was taken to the Appellate Division in which Court we again obtained permission to file a brief. The Appellate Division unanimously upheld Judge Shientag. The matter is now before the Court of Appeals and in that Court also your Counsel filed a brief on behalf of the Society. At this writing the Court of Appeals has not handed down its decision.

Other Counsel Activities

Your Counsel acting with the Committee on By-Laws has examined various proposed Amendments to the Constitution and By-Laws of the State Society and of a number of component County Societies and has rendered advice and made suggestions in connection therewith.

Your Counsel has also been in consultation with the members of the Committee on revision of the Constitution and By-Laws and has rendered advice and given opinions in connection with the matters before that Committee for consideration.

Your Counsel has also rendered advice to the Board of Censors in an appeal taken by a member of one of the component county societies, who had been disciplined by the County Society.

Your Counsel has frequently conferred with Dr David Kaliski, Chairman of the Committee on Workmen's Compen-

5 Inquiry on behalf of a physician who was entitled to receive payment from an insurance company for services rendered to a patient, as to the method of enforcing payment of a fair fee.

6 Inquiry from a physician as to the nature of the relations which a practicing physician should have with an Osteopath in connection with the treatment of compensation cases

7 Inquiry on behalf of a County Medical Society as to whether the Workman's Compensation Committee of a County Board of Supervisors could compel the medical profession of that County to accept fees for work under the Workman's Compensation Act under the schedule of fees in force for the treatment of welfare cases

8 Inquiry by a physician in charge of the X-ray Department of a large metropolitan hospital, as to the length of time the law requires hospitals to retain x-ray plates

9 Inquiry by a physician as to whether a doctor is obliged to examine a patient for the purpose of ascertaining whether or not he is intoxicated when requested to do so by an officer

10 Inquiry as to whether giving the diagnosis of a welfare case on the voucher is a breach of a confidential communication

11 Inquiry on behalf of a County Medical Society as to whether the County Commissioner of public welfare is entitled to restrict the number of visits to welfare patients for which a physician may receive payment, under the Welfare Law, with particular reference to the treatment of such cases as pneumonia

Inquiry as to whether it would be advisable for an individual physician to make a test case in an attempt to collect his fee under the Welfare Law for all necessary visits to a very ill patient

12 Inquiry by a physician who is the Medical Director of a charitable institution as to the possibility of the institution obtaining from all patients a valid waiver of claims for any accident that might occur while they remain inmates at the institution

13 Inquiry by a physician as to his responsibility for treatment rendered by another doctor to whom he has referred a patient

14 Inquiry on behalf of a physician as to his responsibility for the acts of another doctor to whom the physician's telephone calls are referred while he is away from his practice on a vacation

15 Inquiry by a physician as to whether it is proper for a doctor in rendering his bill for services to a welfare patient, to state on the bill the complete diagnosis

16 Inquiry on behalf of a County Medical Society concerning the precise scope of the malpractice defense to which a member of the Society is entitled when insured, under the group plan, and when not covered by such insurance.

17 Inquiry concerning the steps taken in the courts to prevent the practice of medicine by a corporation

18 Inquiry by a physician concerning the period of time within which an action may be brought against a physician upon charges that his negligence caused the death of a patient

19 Inquiry by a physician as to the extent to which an office assistant not licensed or registered as a physiotherapist may legally do physiotherapy work under the supervision and direction of the physician.

20 Inquiry from a physician as to whether a graduate medical student who had completed an internship, but had failed to pass his State Board examinations and to obtain his license to practice, could legally work in the office of a practicing physician and make house calls before he actually became licensed to practice.

21 Inquiry from a doctor at the head of the Department of Pathology of a hospital concerning the following problems with respect to autopsies

(a) The persons who may legally give permission for an autopsy

(b) The extent to which, in the performance of an autopsy, entire organs, or major portions of them, could be removed and retained for teaching purposes, or the building up of a pathology museum

(c) The right of a relative to grant permission for an autopsy upon the body of a married woman, who prior to her death was separated from her husband

22 Inquiry from a physician as to whether he could legally provide a life insurance company with an affidavit concerning the fact that he had treated a patient previously for tuberculosis when it appeared clear that the patient had perpetrated a fraud upon the insurance company in connection with obtaining a life insurance policy

23 Inquiry from one of the Committees of the Society as to the legality of a person without a medical degree advertising himself with the word, "Dr" before his name, with particular reference to instances of telephone listings when a man has a Ph D degree

24 Inquiry as to the following problems concerning operative procedure

(a) Does any State law require two surgeons

COMMITTEE ON WORKMEN'S COMPENSATION

April 15, 1937]

The Committee has had a number of conferences with officials of the Homeopathic and Osteopathic Societies with whom they have established cordial and cooperative relationships.

In addition to the routine business of the Committee, it has during the past year given especial consideration to a number of important matters among which may be mentioned (1) the Minimum Fee Schedule for the remainder of the State outside the Metropolitan area, (2) arbitration of Medical Bills and arbitration of charges of improper transfer of cases (lifting) from authorized and qualified physicians, (3) the inspection and authorization of Employers and Physicians Medical Bureaus, (4) the authorization and licensing of separate x-ray and other Laboratories, (5) simplification of the procedure of designating qualified and authorized physicians by means of code symbols, (6) the publication in the Medical Directory of the State Medical Society of the qualifications of all physicians authorized to treat compensation cases, (7) the submission to the Industrial Commissioner and the Attorney General of briefs on disputed interpretations or rulings affecting the amended law, (8) the preparation of a uniform application blank for physicians of all schools of practise, including osteopaths, (9) the participation as "amicus curiae" in a suit before the Supreme Court and the Appellate Division to test the right of a physician, not authorized to treat workmen's compensation cases, to submit a bill for such services, (10) participation in the deliberations of the Special Committee on Conference with the State Hospital Association in reference to the practices of hospitals in workmen's compensation matters.

One of the most important and far-reaching provisions of the amended act is that relating to the arbitration of disputed bills and all matters relating thereto by arbitration rather than resort to the courts is of vital importance to all the interested parties. It provides at once a prompt, inexpensive and equitable means of settlement of the pecuniary matters involved and at the same time affords an opportunity to all parties of interest to bring to light in the course of

the hearing any evidence of improper practise on either side. The participation of experienced physicians assures proper evaluation of the services of the physician whose bill is being contested at the same time affording an opportunity to the employer or carrier to submit evidence of improper or unethical medical practise or failure to conform to the various provisions of the law. The administration of this procedure by representatives of the Medical Society and of the Carriers' or Employers' organizations affords an opportunity for constructive cooperation in carrying out not only the letter but the spirit of the amended law with the chief purpose of providing the highest quality of medical care for the injured claimant at a reasonable cost.

Arbitrations In the course of the year five conferences were held with representatives of the American Arbitration Association, to whom we are greatly indebted for their kind help, and with representatives of the insurance carriers and the Department of Labor, in order to formulate a legal and workable arbitration procedure for the adjudication of disputed bills under Section 13-g. The methods of procedure have been agreed upon and an office has been established by the Compensation Insurance Rating Board, at 100 East 42 Street, New York City, as a central bureau for the clearing of all bills submitted to arbitration. Arbitrations are now being held at this Bureau for members of New York, Bronx, Richmond, and Queens Counties, and shortly arbitrations will be held in Kings, Westchester, and other adjacent counties. It is the purpose of your Committee to act as a clearinghouse for all arbitrations, cooperating with the Compensation Insurance Rating Board to the end that calendars may be arranged and arbitrations held in all parts of the State in localities convenient to the physicians whose bills are being adjudicated. In the same manner the arbitration of cases improperly transferred or lifted under Section 13-a(3) will be adjudicated.

Approximately 2500 medical bills have been contested and submitted for arbitration. After a conference with the officials of the Compensation Insurance Rating Board and the Compensation Medical Registrar of the Department of Labor

sation, and has given his advice and opinion in regard to the many questions that have arisen during the operation of the Workmen's Compensation Law

Conclusion

To the many members of your Society who have been so generous in giving us unsparingly of their time and talents in the handling of malpractice actions, in court and out, we record our grateful thanks. Without their generous assistance it would have been impossible to obtain the results shown by this report.

Respectfully submitted,

LORENZ J. BROSNAN, Counsel

February 1, 1937

REPORT OF COMMITTEE ON WORKMEN'S COMPENSATION

To the House of Delegates, Gentlemen

Your Committee on Workmen's Compensation herewith submits a report of its activities for the year ending March 1, 1937

A total of 13,476 licensed physicians were qualified by the various County Society Boards up to March 5, 1937. Of these 9,222 are registered in the New York district, 1,274 in the Albany district, 955 in the Buffalo district, 1,110 in the Syracuse district, and 915 in the Rochester district of the Department of Labor. Following is a tabulation according to counties in the State

Albany	235	Niagara	132
Allegany	35	Oneida	180
Bronx	1490	Onondaga	307
Broome	165	Ontario	73
Cattaraugus	65	Orange	114
Cayuga	49	Orleans	22
Chautauqua	86	Oswego	56
Chemung	80	Otsego	40
Chenango	33	Queens	777
Clinton	39	Rensselaer	102
Columbia	28	Richmond	87
Cortland	38	Rockland	64
Delaware	37	St. Lawrence	68
Dutchess-Putnam	107	Saratoga	52
Erie	637	Schenectady	69
Essex	27	Schoharie	24
Franklin	54	Schuyler	9
Fulton	57	Seneca	24
Genesee	39	Steuben	67
Herkimer	46	Suffolk	141
Greene	30	Sullivan	48
Jefferson	90	Tioga	31
Kings	2433	Tompkins	51
Lewis	18	Ulster	89
Livingston	46	Warren	45
Madison	29	Washington	33
Monroe	392	Wayne	56
Montgomery	44	Westchester	509
New York	3402	Wyoming	33
Nassau	319	Yates	23

During the year seventeen regular meetings of the Committee were held. At the request of the Committee the President of the State Society appointed two advisory members to the committee from "up-State." Drs. Harry C. Guess and Joseph P. Henry were appointed in October. This addition to the committee proved a very valuable one and it is recommended that the Workmen's Compensation Committee of three be enlarged to five, at least two of whom shall be members of county societies outside the metropolitan area.

The Committee has participated in twenty-six meetings, conferences, and hearings before the Department of Labor (Commissioner, Industrial Council, etc.) Matters of interest to the State Society or to a particular region or County were considered and will be mentioned in detail below. In addition numerous informal conferences were held. The frequency of the conferences indicates the necessity for continuous contact between the Society and the Department of Labor, if the interests of the medical profession are to be safeguarded. It may be pointed out here that your representatives took a broad stand in general in the hope of aiding the authorities in the proper administration of the amended workmen's compensation law in the interest of all parties. It is felt that only by a fair and equitable carrying out of the new law by all parties concerned can the best interests of the injured workmen of the State be safeguarded. This is the primary purpose of the amended law and in this spirit the Committee has attempted to function.

COMMITTEE ON WORKMEN'S COMPENSATION

Number 81

notary, who shall administer the oath and make a record of the proceedings on the prescribed form. A stenographic transcript of the hearing shall not be required.

8 Arbitration proceedings The claimant physician shall deposit \$2.00 with the recording clerk as a minimum arbitration fee which shall be subject to return as provided in Rule 10. The claimant physician shall present his case, call his witnesses, present his proofs and submit to questions thereon. The defending insurance carrier shall present its defense, call its witnesses, present its proofs and submit to questions thereon. Following the hearing the decision of the arbitrators shall be made in executive session, the arbitrators to be the only persons present at such session. If the four arbitrators cannot agree upon an award they shall select a fifth arbitrator as provided in Section 13-g (2). The case shall then be adjourned and referred to the fifth arbitrator for decision. All papers and exhibits in the proceedings, together with the findings and conclusions of the original arbitrators shall then be sent to the selected arbitrator. If necessary, the fifth arbitrator may order a further hearing before him.

9 Forwarding arbitrators' decision or award The decision or award shall be signed and acknowledged by the arbitrators. The original shall be mailed to the Labor Department and copies thereof shall be sent to the physician, insurance carrier, Medical Society and Rating Board by the recording clerk.

10 Payment of award and arbitration fees The award shall provide for payment as follows: The insurance carrier shall draw two checks, one check for 95% of the award payable to the order of the claimant physician, and the second check for 10% of the award payable to the order of the Commissioner, the latter check to cover the carrier's share and claimant physician's share of the arbitration fee, provided, however, that if the carrier and claimant physician are each required to pay the minimum arbitration fee of \$2.00, the check to the claimant physician shall be for an amount equal to the award less \$2.00, the check to the Commissioner shall be for the sum of \$4.00, and the recording clerk shall return to the claimant physician the minimum arbitration fee of \$2.00 which was deposited by such physician at the time of the arbitration hearing. In the case where the claim is disallowed or where the award is for an amount less than \$2.00, the carrier shall mail its check for the minimum fee of \$2.00 to the Commissioner and the recording clerk shall transmit to the Commissioner the minimum arbitration fee of \$2.00 which

was deposited by the claimant physician at the time of the arbitration hearing.

Claim by Physician for Improper Transfer or Lifting of a Case

§ 13-a 3(2) An authorized physician from whom the case has been transferred shall have the right of appeal to an arbitration committee as provided in subdivision two of section thirteen-g and if said arbitration committee finds that the transfer was not authorized by this section, said employer shall pay to the physician a sum equal to the total fee earned by the physician to whom the care of the injured employee has been transferred, or such proportion of said fee as the arbitration committee shall deem adequate.

 the care of _____

The Minimum Fee Schedule has been the subject of discussion and conferences ever since the passage of the amended act. It was only officially promulgated by the Industrial Commissioner for the metropolitan area on May 1, 1936. To this day a minimum fee schedule for the remainder of the state has not been announced by the Commissioner. Your Committee has submitted evidence to show that the metropolitan schedule is in fact the prevailing rate throughout the greater part of the state. Your committee has obtained from a number of county societies scattered throughout the state compensation schedules which have been in effect for a number of years and in some instances preceding the amendment of the law, tending to show that many insurance carriers have been paying physicians bills submitted under these schedules which are no lower than the metropolitan schedule and in a few instances higher. At a public hearing called by the Industrial Commissioner in Albany on May 26, 1936 which was attended by your committee as

many of these bills were amicably settled and the remainder are now being placed on the calendar for arbitration

Two calendars a week are being disposed of and shortly it is felt that arbitration proceedings will not be necessary oftener than once or twice a month for the largest counties

Only recently at the urgent insistence of your Committee have the self-insured employers' organizations promised to set up arbitration proceedings in accordance with the law

A set of ten rules was adopted and established by the Industrial Council as follows

Rules of Procedure on Arbitration of Medical Bills

Under Sections 13-A (3) and 13-C of the Workmen's Compensation Law

Abbreviations

"Commissioner" refers to the Industrial Commissioner of the State of New York.

"Labor Department" refers to the Department of Labor of the State of New York

"Medical Society" refers to the Medical Society of the State of New York

"Rating Board" refers to the Compensation Insurance Rating Board

Procedure

1 Notice of objection to medical bill by insurance carrier On receipt of a medical bill which is regarded as unfair, notice of any objection thereto shall be given by the employer or carrier in accordance with Section 13-g (1) within thirty days after receipt of the bill on a form approved for this purpose. The original is to be mailed to the Commissioner and copies thereof shall be sent to the claimant physician, Medical Society and Rating Board. The notice shall briefly state all objections to the bill. In cases where there has been no determination as to whether the injury is compensable, the notice of objection shall so state

2 Claim by physician of improper transfer An "authorized" physician claiming that a case has been improperly transferred may arbitrate as provided in Section 13-a (3) by filing his claim on an approved form with the Commissioner and forwarding copies thereof to the Medical Society, Rating Board and insurance carrier

3 Preparation of arbitration calendar The Medical Society and the Rating Board shall jointly prepare a calendar of cases for arbitration and mutually arrange for the

time and place of hearing. A copy of such calendar shall be mailed by the Rating Board to the Commissioner

4 Selection of arbitrators In accordance with Section 13-g (2) an arbitration committee shall comprise two physicians designated by the Medical Society and two physicians designated by the Rating Board. The Rating Board shall prepare a panel of arbitrators who are members of the Medical Society. The names on the panel shall give addresses and qualifications. From this panel the Rating Board shall choose two arbitrators, giving consideration to the nature of the case and the place where the arbitrators shall meet, provided, however, that the insurance carrier may name arbitrators of its own selection in any particular case, the nominations to be made through the Rating Board. The Medical Society shall prepare panels of arbitrators and choose therefrom two arbitrators to serve at the time and place agreed upon

5 Notices relating to arbitration hearing The Rating Board shall mail notice of the hearing containing the time and place thereof, with the names of the arbitrators which it has selected, at least eight days before the date of the hearing, to the insurance carrier and the arbitrators selected by the Rating Board. The Medical Society shall mail like notice of the hearing together with the names of the arbitrators which it has selected, to such arbitrators and the physician making the claim. The place of meeting shall be arranged in conference with the Medical Society

6 Submission of formal agreements to arbitration required The parties to arbitration shall sign a formal agreement, known as a "Submission," to submit the controversy to arbitration. The insurance carrier shall show in the proper spaces on the Submission form the names of the parties, the sum in dispute and claimed by plaintiff, the name of the employee to whom the medical or professional services were rendered and the date of notice of Objection to Medical Bill. The insurance carrier shall then sign and acknowledge such form before a notary and send it together with the Objection to Medical Bill to the claimant physician. The claimant physician, if agreeing to arbitration, shall also sign and acknowledge the said Submission form and return it to the insurance carrier. The latter shall then forward the completely executed form to the Rating Board for further action in arbitration

7 Record of arbitration proceedings The arbitrators shall be required to take the oath of office. The Rating Board shall appoint a recording clerk, qualified as a

COMMITTEE ON WORKMEN'S COMPENSATION

April 15, 1937]

in relation to the authorization of an employer's compensation medical bureau

28 The bureau should be located in the industrial plant or in the immediate vicinity

29 The question of the necessity of the presence of a physician during working hours, or the availability of a physician at stated hours should be determined by an inspection of the plant to ascertain the nature of the hazards and the frequency of accidents

30 The bureau shall be well housed with sufficient space, light, and air and shall conform to reasonable sanitary requirements Proper facilities in the form of personnel for assistance in emergencies, instruments, sterilizers, dressings, drugs, shall be available at all times and in amounts proportionate to the size of the plant and the number of employees Such facilities shall be adequate for more than mere emergency care and for the more severe type of industrial injury

31 A bureau license may be given for a stated project which, because of the hazards of the project and the frequency of accidents, requires continued medical care and such license shall be for the life of the given project only In such cases all employees of all subcontractors shall be covered by the license

32 No license shall be issued to an employer to cover any but his own employees except as indicated in Rule 31

33 First aid stations—No license is required to operate a first aid station by an employer of labor Such first aid or emergency station should be properly equipped for first aid in accordance with the type of hazard encountered at the particular place of employment.

34 Form C-105, a notice of the rights of an injured employee and the responsibilities of the employer, shall be posted in each compensation medical bureau and first aid station

35 All compensation medical bureaus operated by summer camps and other institutions wherein such camps and institutions are operating for a profit shall be charged a license fee of \$25.00 per annum for the operation of such medical bureaus which are in operation for six months of the year or less

Up to the present time approximately 350 such bureau licenses have been applied for, of which approximately 150 have been already licensed or approved for license and about thirty have been refused by the various county society

boards A number of these are being reconsidered A considerable number of applications for employers licenses were withdrawn when the rules were promulgated and it was ascertained that only a first aid station was required by the employer

It is urged that County Societies proceed at once to inspect and recommend to the Industrial Commissioner such Bureaus as meet with the requirements of the law and conform to the above rules and regulations

Laboratory licenses x-ray and pathology Up to the present time fewer than ten separate laboratory licenses under Section 13-c have been applied for and as yet none has been approved

Physicians medical bureaus During the past few months your Committee has concerned itself with the licensing of physician's medical bureaus under Section 13-c(1) and has devised an application form which has been promulgated by the Industrial Commissioner and is known as C-121

The Commissioner has ruled that "When a physician in association or in co-partnership with another physician or physicians, or through physician or physicians as employee or agent maintains and operates one or more offices principally for the treatment of injured claimants under the Workmen's Compensation Act, he shall secure a Compensation Medical Bureau license" For such license the fee is \$50 per year for each office Application forms may be obtained from the Department of Labor and must be sent to the County Society in which the bureau is located for inspection and approval of the Bureau No license may be issued by the Commissioner in the absence of recommendation from the appropriate society or Board (Section 13-c) Applications for the conduct of such Bureaus are now being received and inspections by the County Society Boards are now under way County Societies should give wide publicity to the need for such licenses and proceed at once to inspect and notify the Commissioner of the approval or disapproval of the Society

Simplification of classifications In the course of the year your Committee recommended a revision and simplification

well as by representatives of many county societies throughout the state, it was the unanimous opinion of all the physicians present that the prevailing rate was in fact no lower than the metropolitan schedule and the opinion was generally voiced that any rate lower than the metropolitan schedule would work a hardship to the physicians of the state and tend to lower the standard of medical care. The carriers and employers representatives based their argument on lower wage rates in the urban areas and the lower cost of providing medical care on the part of physicians. These arguments were refuted. No actual figures or statistics to prove their contentions have been submitted so far as is known. That certain employers and carriers were able to "purchase" medical care at rates lower than the metropolitan area by means of concentrating the work in the hands of a few favored company doctors is probably true. This was true also in the metropolitan area but it did not prevent an agreement between the carriers' organization and representatives and your committee on a schedule which represented fair compensation under the free choice principle, and it did not deter the Industrial Commissioner from promulgating such a schedule for the metropolitan area. One of the purposes of the new law is to improve the quality of medical service and to prevent many of the evils and abuses of the old law by allowing the patient to select his own qualified physician. This desirable result will be defeated by paying doctors a fee lower than the prevailing rate for working people in this state. In many of the smaller communities where most of the inhabitants may be placed in the working-class category it will result in physicians being paid lower fees than are paid in private practice and will tend to lower fees in private practice. It will inevitably lead to a refusal on the part of the best qualified physicians in these communities to treat injured workmen or possibly to combine to refuse all cases except at their own terms. It is strongly recommended that the State Society memorialize the Industrial Commissioner to promulgate the metropolitan schedule for the entire state to avoid the above possibilities and to assure the widest participation in the care of the injured on

the part of the largest number of ethical and qualified doctors of this state.

At the hearing in Albany the Commissioner proposed a reduction of ten per cent of the metropolitan schedule for communities of 75,000 to 35,000 and of fifteen per cent for all communities under 35,000 population. Due to the pressure brought to bear by the profession of the state this schedule was not announced and physicians in these communities are rendering bills in accordance with prevailing rates under the old competitive system. This has led to a great deal of confusion and has retarded the putting into effect of all the provisions of the amended law. It is again strongly urged that the Industrial Commissioner promulgate the metropolitan schedule at once. In the metropolitan area the Commissioner has permitted a deduction of five per cent from all bills of \$15.00 and over if paid within thirty days. There has been widespread dissatisfaction with this provision. It is much too large a discount and has not had the effect of stimulating prompt payment generally, but has actually had the effect of causing numerous disputes between physicians and carriers and employers. This rule should be rescinded. Surely without a penalty for failure to pay bills within the same period it is unfair, and does not accomplish its purpose. It is recommended that the Commissioner be urged to rescind or modify this item of the fee schedule by adding a penalty of five per cent for non-payment within thirty days, and certainly not include it in any schedule which he may promulgate for the entire state.

Compensation Medical Bureaus

The inspections and recommendations of Employers' medical bureaus under Section 13-c (1) were begun during the year by the various County Society Boards in accordance with rules and regulations formulated by this Committee after conference with representatives of the employers and self-assurers organizations and published by the Industrial Commissioner (December 1, 1936).

27 The character and frequency of accidents, the number of employees in a given plant and the availability of qualified medical care in the immediate vicinity of the place of employment should be considered

COMMITTEE ON WORKMEN'S COMPENSATION

April 15, 1937]

in relation to the authorization of an employer's compensation medical bureau

28. The bureau should be located in the industrial plant or in the immediate vicinity

29 The question of the necessity of the presence of a physician during working hours, or the availability of a physician at stated hours should be determined by an inspection of the plant to ascertain the nature of the hazards and the frequency of accidents

30 The bureau shall be well housed with sufficient space, light, and air and shall conform to reasonable sanitary requirements Proper facilities in the form of personnel for assistance in emergencies, instruments, sterilizers, dressings, drugs, shall be available at all times and in amounts proportionate to the size of the plant and the number of employees Such facilities shall be adequate for more than mere emergency care and for the more severe type of industrial injury

31 A bureau license may be given for a stated project which, because of the hazards of the project and the frequency of accidents, requires continued medical care and such license shall be for the life of the given project only In such cases all employees of all subcontractors shall be covered by the license

32 No license shall be issued to an employer to cover any but his own employees except as indicated in Rule 31

33 First aid stations—No license is required to operate a first aid station by an employer of labor Such first aid or emergency station should be properly equipped for first aid in accordance with the type of hazard encountered at the particular place of employment

34 Form C-105, a notice of the rights of an injured employee and the responsibilities of the employer, shall be posted in each compensation medical bureau and first aid station

35 All compensation medical bureaus operated by summer camps and other institutions wherein such camps and institutions are operating for a profit shall be charged a license fee of \$25.00 per annum for the operation of such medical bureaus which are in operation for six months of the year or less

Up to the present time approximately 350 such bureau licenses have been applied for, of which approximately 150 have been already licensed or approved for license and about thirty have been refused by the various county society

boards A number of these are being reconsidered A considerable number of applications for employers licenses were withdrawn when the rules were promulgated and it was ascertained that only a first aid station was required by the employer

It is urged that County Societies proceed at once to inspect and recommend to the Industrial Commissioner such Bureaus as meet with the requirements of the law and conform to the above rules and regulations

Laboratory licenses r-ray and pathology Up to the present time fewer than ten separate laboratory licenses under Section 13-c have been applied for and as yet none has been approved

Physicians medical bureaus During the past few months your Committee has concerned itself with the licensing of physician's medical bureaus under Section 13-c(1) and has devised an application form which has been promulgated by the Industrial Commissioner and is known as C-121

The Commissioner has ruled that "When a physician in association or in co-partnership with another physician or physicians, or through physician or physicians as employee or agent maintains and operates one or more offices principally for the treatment of injured claimants under the Workmen's Compensation Act, he shall secure a Compensation Medical Bureau license" For such license the fee is \$50 per year for each office Application forms may be obtained from the Department of Labor and must be sent to the County Society in which the bureau is located for inspection and approval of the Bureau No license may be issued by the Commissioner in the absence of recommendation from the appropriate society or Board (Section 13-c) Applications for the conduct of such Bureaus are now being received and inspections by the County Society Boards are now under way County Societies should give wide publicity to the need for such licenses and proceed at once to inspect and notify the Commissioner of the approval or disapproval of the Society

Simplification of classifications In the course of the year your Committee recommended a revision and simplification

tion of the classifications granted by the County Society Boards to applicant physicians with a view of simplifying the symbols

This was necessitated first, by the limitations of space in the State Directory and secondly, by a realization that certain local county societies had misunderstood the instructions of the Committee, issued at the inception of the new law, due to the haste with which the qualifying procedure was undertaken in the summer of 1935. The meaning of Section 13-b 2 was not fully understood by certain County Societies, so that in many instances physicians were granted special symbols in many branches, even though their work embraced what is generally known as "general practice." A large amount of explanatory correspondence was sent out to the various societies and published in the *STATE JOURNAL* so that for the most part physicians have now been properly classified. In general it may be said that the symbol "X" repre-

sents the field of general practice and special additional symbols are not required or justified unless the physician, though not a specialist, is especially qualified by education, training, and experience in a special field. It is the responsibility under Section 13-b of the County Society Board to qualify a physician and designate his type of practice strictly in accordance with his actual qualifications.

Publication of classifications. Through the kind cooperation of the *JOURNAL* Management Committee a special marker has been placed before the name of every physician in the state who is qualified under the Workmen's Compensation Law, and the actual symbols granted him appear under his name. Despite the haste with which the work was done very few mistakes were made. It is expected that next year's Directory will contain a more accurate roster of all physicians qualified under the Workmen's Compensation Act, together with their proper symbols. A roster of names and qualifications of all physicians in the state will be prepared by the State Office and at the same time memorialize the Industrial County Society for the entire state to avoid the at the possibilities and to assure the widest participation in the care of the injured on

Opinions rendered by Attorney General. In the course of the year conferences with the Industrial Council have resulted in the submission to the Attorney General of many moot points in the law. Opinions have been rendered by the Attorney General to the Industrial Commissioner in the following items:

1 The extent of authority that may be used by Compensation Boards in considering the applications filed by physicians for authorization to practice under the amended Act.

2 An opinion as to the necessity of licensing corporate or lay-owned x-ray laboratories seeking licenses under Section 13-c.

3 An opinion concerning the failure of the law to provide a penalty against a physician treating injured employees without authorization and suggesting an amendment to the Law providing that any violation of any of its provisions shall constitute a misdemeanor.

4 An opinion indicating that a certain clause in the physician's application blank waiving certain rights of the applicant shall be eliminated.

Following this opinion the application blank submitted to physicians was modified by the elimination of this waiver clause.

5 An opinion indicating that insurance carriers and employers shall pay medical bills submitted by public hospitals in the city of New York for services rendered by physicians because of section 692-e of the New York State Charter providing that "physicians shall serve in such hospitals without compensation."

This prohibition has been modified in the new New York City Charter which goes into effect in 1938 by the inclusion of a clause permitting the payment of physicians for medical services in compensation cases.

6 An opinion stating that compensation x-ray and diagnostic laboratories even though owned by lay-persons or corporations may submit bills for services rendered by qualified physicians.

Your Committee will with the sanction of the State Society press for the submission of an amendment to the Law to include in the amended Act under Section 13-b 3 the word "owned" before the words "operated or supervised by qualified physicians" so that the clause shall read "Laboratories and Bureaus engaged in x-ray diagnosis or treatment, etc. shall be owned, operated, and supervised by qualified physicians duly authorized under this Chapter." This was the wording of the original legislation, but modified without our consent or advice.

COMMITTEE ON WORKMEN'S COMPENSATION

Number 81

7 An opinion indicating that all bills for treatment rendered by physicians outside this State contested by the carriers or employers must be referred to the medical bill calendar of the Department of Labor for adjudication

8 An opinion defining the authority of the Industrial Commissioner in adopting and promulgating rules regulating insurance carriers in respect to sending out lists of authorized physicians to their policy holders, as well as the procedure to be followed by medical inspectors and consultants employed by them

This opinion gave rise to Rules 23, 24, 25, and 26, promulgated by the Industrial Commissioner on December 1 1936

Your Committee attended one hearing by the Commissioner in which an insurance carrier was charged with violation of these rules and the matter has been referred by the Industrial Commissioner to the Commissioner of Insurance of the State for further opinion and action against the carrier

Attorney General's Opinion

Replying to your letter of April 14, 1936, attaching memorandum to Dr David J Kaliski, Chairman of the Committee on Workmen's Compensation, dated April 14, 1936, together with memorandum of Leon S Senior, general manager of the Compensation Insurance Rating Board dated April 20, 1936, all of which are presented to this department to determine the policy and attitude of this department to the practice of certain insurance carriers who are writing their policy-holders suggesting that in case of injuries to their employees a suggested physician take care of the worker, please be advised that our opinion in the matter is as follows

The purpose of the amendments to Section 13 of the Workmen's Compensation Law is best summarized by the special message of the Governor of the State of New York dated March 19, 1934 (S B 184, pp 43 and 44) From it we obtain the true intent and purpose of the enactments of the amendments (*In re Sitkins Will*, 271 NYS 688, 151 Misc 448) namely to permit the employee freedom of action in choosing his physician It was intended by the amendments that the employee's choice be free from coercion or persuasion

Under Section 13-A it is provided that "if the employee is unable, due to the nature of the injury, to select such authorized physician, and the emergency nature

of the injury requires immediate medical treatment and care, or if he does not desire to select a physician and in writing so advises the employer, the employer shall promptly provide him with the necessary medical care, provided however that nothing herein contained shall operate to prevent such employee, when subsequently able to do so, from selecting for continuance of any medical treatment or care required, any physician authorized by the commissioner to render medical care"

The wording of this section makes it clear that the right of free choice is unqualifiedly reserved to the employee, though the employer is responsible for the payment of medical care under the section

Section 13-j prohibits the participation of an insurance carrier in the treatment of injured workmen Section 13-j reads as follows

Medical or surgical treatment by insurance carriers and employers (1) An insurance carrier shall not participate in the treatment of injured workmen, except, that it may employ medical inspectors to examine compensation cases periodically, while under treatment, and report upon the adequacy of medical care, and other matters relative to the medical conduct of the case (2) An employer may maintain a compensation medical bureau at the place or places of employment, if such bureau is required because of the nature of industrial hazards, or the frequency of injuries to employees arising out of industry Such bureau or bureaus shall be authorized and licensed pursuant to section thirteen-c, and their use by an injured employee shall be optional in accordance with the provisions of section thirteen-a

While this section reserves to the insurance carriers some right of supervision, the actual treatment and control seems to be definitely vested in the employee

We are of the opinion, that by the language of section 13-j, the insurance carrier is precluded from sharing, participating or having a part in the treatment of the injured employee To give this section any other interpretation would be to negative the purpose of the amendments to section 13

The insurance carriers rely upon section 13-i for their authority to recommend or solicit in behalf of their physicians Section 13-i reads as follows

Solicitation prohibited Any person who shall make it a business to solicit employment for any person authorized by this chapter to render medical care to an injured employee any person authorized by this chapter to render in connection with any claim under this chapter, shall be guilty of a misdemeanor, except that the employer shall have the right subject to regulations prescribed by the commission to recommend to

tion of the classifications granted by the County Society Boards to applicant physicians with a view of simplifying the symbols

This was necessitated first, by the limitations of space in the State Directory and secondly, by a realization that certain local county societies had misunderstood the instructions of the Committee, issued at the inception of the new law, due to the haste with which the qualifying procedure was undertaken in the summer of 1935. The meaning of Section 13-b 2 was not fully understood by certain County Societies, so that in many instances physicians were granted special symbols in many branches, even though their work embraced what is generally known as "general practice." A large amount of explanatory correspondence was sent out to the various societies and published in the STATE JOURNAL so that for the most part physicians have now been properly classified. In general it may be said that the symbol "X" represents the field of general practice and special additional symbols are not required or justified unless the physician, though not a specialist, is especially qualified by education, training, and experience in a special field. It is the responsibility under Section 13-b of the County Society Board to qualify a physician and designate his type of practice strictly in accordance with his actual qualifications.

Publication of classifications. This opinion gave rise to Rules 23, 24, 25, and 26, promulgated by the Industrial Commissioner on December 1 1936

Your Committee attended one hearing by the Commissioner in which an insurance carrier was charged with violation of these rules and the matter has been referred by the Industrial Commissioner to the Commissioner of Insurance of the State for further opinion and action against the carrier

Attorney General's Opinion

Replying to your letter of April 14, 1936, attaching memorandum to Dr David J Kaliski, Chairman of the Committee on Workmen's Compensation, dated April 14, 1936, together with memorandum of Leon Senior, general manager of the Compensation Insurance Rating Board dated April 20, 1936, all of which are presented to this department to determine the policy and attitude of this department to the practice of certain insurance carriers who are writing their policy-holders suggesting that in case of injuries to their employees a suggested physician take care of the worker, please be advised that our opinion in the matter is as follows

The purpose of the amendments to Section 13 of the Workmen's Compensation Law is best summarized by the special message of the Governor of the State of New York dated March 19, 1934 (S B 184, pp 43 and 44) From it we obtain the true intent and purpose of the enactments of the amendments (*In re Sitkins Will*, 271 NYS 688, 151 Misc 448) namely to permit the employee freedom of action in choosing his physician. It was intended by the amendments that the employee's choice be free from coercion or persuasion

Under Section 13-A it is provided that "if the employee is unable, due to the nature of the injury, to select such authorized physician, and the emergency nature

of the injury requires immediate medical treatment and care, or if he does not desire to select a physician and in writing so advises the employer, the employer shall promptly provide him with the necessary medical care, provided however that nothing herein contained shall operate to prevent such employee, when subsequently able to do so, from selecting for continuance of any medical treatment or care required, any physician authorized by the commissioner to render medical care"

The wording of this section makes it clear that the right of free choice is unqualifiedly reserved to the employee, though the employer is responsible for the payment of medical care under the section

Section 13-j prohibits the participation of an insurance carrier in the treatment of injured workmen Section 13-j reads as follows

Medical or surgical treatment by insurance carriers and employers (1) An insurance carrier shall not participate in the treatment of injured workmen, except, that it may employ medical inspectors to examine compensation cases periodically, while under treatment, and report upon the adequacy of medical care, and other matters relative to the medical conduct of the case (2) An employer may maintain a compensation medical bureau at the place or places of employment, if such bureau is required because of the nature of the industrial hazards, or the frequency of injuries to employees arising out of industry Such bureau or bureaus shall be authorized and licensed pursuant to section thirteen-c, and their use by an injured employee shall be optional in accordance with the provisions of section thirteen-a

While this section reserves to the insurance carriers some right of supervision, the actual treatment and control seems to be definitely vested in the employee

We are of the opinion, that by the language of section 13-j, the insurance carrier is precluded from sharing, participating or having a part in the treatment of the injured employee To give this section any other interpretation would be to negative the purpose of the amendments to section 13

The insurance carriers rely upon section 13-i for their authority to recommend or solicit in behalf of their physicians Section 13-i reads as follows

Solicitation prohibited Any person who shall make it a business to solicit employment for any person authorized by this chapter to render medical care to an injured employee any person authorized by this chapter to render in connection with any claim under this chapter, shall be guilty of a misdemeanor, except that the employer shall have the right subject to regulations prescribed by the commission to recommend to

the injured employee the names of enrolled physicians who he believes to be competent to treat him.

This permission to recommend, however, is granted only where the employee has waived his right or is unable to exercise it. It is not given to the employer as a right in contravention to the employee's right to free choice of physician.

* *

An opinion was obtained by the Industrial Board from the Attorney General that it is not necessary for a licensed physician to be listed on the panel of authorized physicians provided such physician merely makes physical examinations and gives testimony for claimants at hearings and does not treat, that the claimant may pay such physician for his services and that only physicians *rendering treatment* under the Act are stopped from receiving fees from claimants and must have recourse to the employer or carrier.

The Committee has under consideration a uniform physician's application blank meeting all requirements of the law in accordance with the rulings of the Attorney General. It will be available to all new applicants regardless of their Society or School affiliations shortly.

Recently the Industrial Commissioner held a hearing to which insurance carriers and self-insured employers were invited to attend and to submit statements concerning medical costs covering a period of one year prior to the amended Act, and a like period subsequent to the amendment.

At this hearing the insurance carriers stated that they were unable to present definite figures and accurate statistics at this time. They further stated that they would not be able to submit figures for at least another year.

It was merely the impression of certain insurance carriers that general medical costs had risen. How much of this supposed rise could be attributed to the actual cost of medical care they were not able to ascertain at this time.

Your Committee was represented at this meeting and submitted the belief that under the new law the quality of medical care had increased materially, and that it was their opinion that certain representatives of insurance carriers were of the impression that the cost of medical care had not risen. Your Committee expressed

the opinion that with the control of many abuses which existed under the old law and which are rapidly disappearing now, and as the result of the arbitration of disputed medical bills, the cost of medical care will not materially increase, and that there might even be a decline in the costs to the employers of the State. The fact that self-insurers have not availed themselves of arbitration up to the present time is significant in this regard.

The right of a licensed physician to accept and treat Workmen's Compensation cases without being qualified by the medical societies and authorized by the Industrial Commissioner was tested in the courts during the year. The plaintiff in the case was a licensed but unauthorized physician who treated an injured employee entitled to medical care under the Workmen's Compensation Law and with the consent of the employer. The physician then sued the employer in the Court to enforce payment of his bill. He did not allege in his complaint, however, that he had been duly authorized to render medical care under the Workmen's Compensation Act as amended in 1935.

The question of Law came up for decision before Justice Bernard Shientag in the Supreme Court of New York County. A very sweeping and significant decision was handed down by the learned justice and was published in the *Law Journal*, June 4, 1936.

The Justice held that

1 The Legislature has power to abrogate in whole or in part the common-law rights of physicians who treat Workmen's Compensation cases, and that a physician's exclusive remedy to recover payment for treating compensation cases shall be under the Workmen's Compensation Law and not in the Courts, that the Legislature may by reasonable provisions restrict and limit the contractual relations between physicians on the one hand and employers or injured employees on the other, and that reasonable restrictions may be made applicable not alone to the awards to physicians under the Workmen's Compensation Law but to actions for services in the courts as well.

2 The requirement that only physicians who are specially authorized by the Industrial Commissioner for that purpose may treat injured employees in accordance with the provisions of the Workmen's Compensation Law is a reasonable one, calculated to accomplish the humane objects of that

COMMITTEE ON WORKMEN'S COMPENSATION

April 15, 1937]

statute and to do away with abuses and evil practices that arose in connection with its administrations

3 No physician under the amended statute is permitted to treat compensation cases or entitled to be paid therefore unless he is "authorized" by the Industrial Commissioner, and this applies whether the physician is chosen by the employee or by the employer

4 Assuming but not deciding that a physician chosen by an employer to treat a compensation case may, despite the amended statute, sue the employer in the courts for payment of his services, as a condition to recovery he is required to allege and prove that he was duly authorized to render medical care to injured employees under the Workmen's Compensation Law

This sweeping decision was upheld unanimously by the Appellate Division of the Supreme Court and permission was given the appellant to take the case to the Court of Appeals where it now rests pending a decision

A few sentences of the Justice's decision are worthy of quotation in this connection

It is significant that the Medical Society of the State of New York as *amicus curiae* has submitted a most convincing brief in support of the position here taken. Courts should be slow to interfere in a field where the Legislature is competent to act.

The Workmen's Compensation Law as a whole and its component parts should be liberally construed with a view to the accomplishment of this humane purpose.

Your Committee entered this case as "*amicus curiae*" and submitted a brief which was prepared by Mr. Lorenz J. Brosan, to whom the State Society is greatly indebted for his labors in this and other important issues

A decision was handed down by Justice McLaughlin of the Supreme Court of the Bronx under date of June 12, 1936, in the case of two members of the medical profession who had formed a partnership to engage in soliciting business and dividing the fees in Workmen's Compensation cases. One of these physicians sued in the court for the dissolution of the partnership. The Justice in commenting on this case stated that the situation at the time the partnership was formed, while not illegal, was certainly unethical. As long as their activities trespassed on

the realm of professional ethics only, the Courts were not concerned. After July 1, 1935, however, a Law went into effect which allowed an injured employee to choose his own physician and forbade the splitting of fees received for treating injured employees

The Justice's decision was to the effect that as soon as the Law went into effect the partnership became illegal. The prayer of the plaintiff to dissolve the partnership on that ground therefore was granted

This decision gives force to the provisions of the Law which forbid the splitting or division of fees in Workmen's Compensation cases. The decision makes no comment on a legitimate partnership entered into for a proper purpose under the Workmen's Compensation Act

Under date of June 10, 1936, your Committee submitted a brief to the effect that neither a layman nor a corporation may hire doctors for the purpose of engaging in the "practice of medicine" without violating the provisions of the Education Law, and holding that no lay-owned or corporate-owned compensation laboratory or bureau should be licensed under Section 13-c of the amended Workmen's Compensation Act

This brief was in answer to a decision handed down by the Attorney General to the Industrial Commissioner, dated May 26, 1936, and in reply to a question submitted by the Industrial Commissioner as to whether compensation x-ray laboratories should submit bills for x-ray services or whether the physicians who were in charge of the laboratories should personally submit the bills for such services. In this opinion the Attorney General pointed to Section 13-b, subdivision 3 of Chapter 930 of the Laws of 1935

STATE OF NEW YORK
DEPARTMENT OF LAW
NEW YORK CITY

May 26th, 1936

Hon Elmer F. Andrews,
Industrial Commissioner,
80 Centre Street
New York, N. Y.

Dear Commissioner Andrews
Replying to your letter of May 11, 1936, wherein you request an opinion as to whether compensation x-ray laboratories

the injured employee the names of enrolled physicians who he believes to be competent to treat him.

This permission to recommend, however, is granted only where the employee has waived his right or is unable to exercise it. It is not given to the employer as a right in contravention to the employee's right to free choice of physician.

* *

An opinion was obtained by the Industrial Board from the Attorney General that it is not necessary for a licensed physician to be listed on the panel of authorized physicians provided such physician merely makes physical examinations and gives testimony for claimants at hearings and does not treat, that the claimant may pay such physician for his services and that only physicians *rendering treatment* under the Act are stopped from receiving fees from claimants and must have recourse to the employer or carrier.

The Committee has under consideration a uniform physician's application blank meeting all requirements of the law in accordance with the rulings of the Attorney General. It will be available to all new applicants regardless of their Society or School affiliations shortly.

Recently the Industrial Commissioner held a hearing to which insurance carriers and self-insured employers were invited to attend and to submit statements concerning medical costs covering a period of one year prior to the amended Act, and a like period subsequent to the amendment.

At this hearing the insurance carriers stated that they were unable to present definite figures and accurate statistics at this time. They further stated that they would not be able to submit figures for at least another year.

It was merely the impression of certain insurance carriers that general medical costs had risen. How much of this supposed rise could be attributed to the actual cost of medical care they were not able to ascertain at this time.

Your Committee was represented at this meeting and submitted the belief that under the new law the quality of medical care had increased materially, and that it was their opinion that certain representatives of insurance carriers were of the impression that the cost of medical care had not risen. Your Committee expressed

the opinion that with the control of many abuses which existed under the old law and which are rapidly disappearing now, and as the result of the arbitration of disputed medical bills, the cost of medical care will not materially increase, and that there might even be a decline in the costs to the employers of the State. The fact that self-insurers have not availed themselves of arbitration up to the present time is significant in this regard.

The right of a licensed physician to accept and treat Workmen's Compensation cases without being qualified by the medical societies and authorized by the Industrial Commissioner was tested in the courts during the year. The plaintiff in the case was a licensed but unauthorized physician who treated an injured employee entitled to medical care under the Workmen's Compensation Law and with the consent of the employer. The physician then sued the employer in the Court to enforce payment of his bill. He did not allege in his complaint, however, that he had been duly authorized to render medical care under the Workmen's Compensation Act as amended in 1935.

The question of Law came up for decision before Justice Bernard Shientag in the Supreme Court of New York County. A very sweeping and significant decision was handed down by the learned justice and was published in the *Law Journal*, June 4, 1936.

The Justice held that

1 The Legislature has power to abrogate in whole or in part the common-law rights of physicians who treat Workmen's Compensation cases, and that a physician's exclusive remedy to recover payment for treating compensation cases shall be under the Workmen's Compensation Law and not in the Courts, that the Legislature may by reasonable provisions restrict and limit the contractual relations between physicians on the one hand and employers or injured employees on the other, and that reasonable restrictions may be made applicable not alone to the awards to physicians under the Workmen's Compensation Law but to actions for services in the courts as well.

2 The requirement that only physicians who are specially authorized by the Industrial Commissioner for that purpose may treat injured employees in accordance with the provisions of the Workmen's Compensation Law is a reasonable one, calculated to accomplish the humane objects of that

From all of the foregoing, it is our opinion that a duly authorized compensation x-ray laboratory may submit bills for x-ray services rendered by it.

Yours very truly,
JOHN J. BENNETT, JR.
Attorney General

By JOSEPH A. McLAUGHLIN (Signed)
Assistant Attorney General

The Attorney General stated that from this it appeared that a *bureau* engaged in diagnosis or x-ray treatment need not be owned by a physician, but must be operated or supervised by a duly qualified physician and such laboratory was subject to the provisions of Section 13-c of this chapter, which according to the Attorney General definitely makes lawful the licensing of such laboratories and bureaus and prescribes the regulations to which they become subject.

The Attorney General was of the opinion that the Legislative intent was to permit x-ray laboratories to perform their services without the necessity of functioning through the physician except as prescribed by the law, namely, that the laboratory must be operated or supervised by a duly authorized qualified physician. The opinion then states that if the physician is a mere employee it does not seem reasonable that he should render the bill for x-ray services. Up to the present time this matter has not been considered *de novo* by the Attorney General as was requested in our brief of June 10.

It is the opinion of your Committee that licensed lay or corporate-owned laboratories would be not only a violation of the Education Law of this State, but would also be contrary to the spirit of the new legislation which went into effect on July 1, 1935, and which was intended to eliminate the evils and abuses which had crept into compensation practice largely because of the participation of lay persons and corporate bodies in the practice of medicine. Up to the present time no lay owned or corporate owned x-ray laboratory has been recommended for licensing by County Society Workmen's Compensation Boards. This matter was brought to the attention of the Executive Committee some time ago and the views of your Committee were upheld. Permission was given to persist in this attitude, and if necessary to defend

any action brought to compel the Board to license such lay-owned laboratories which engage in the diagnosis and/or treatment of Workmen's Compensation cases and, if such license is granted by the Industrial Commissioner after the refusal of the County Board to act to take such steps in the Court to bring about its nullification.

It is strongly urged that the State Society go on record as opposing the participation of lay persons directly or indirectly in the practice of medicine under the Workmen's Compensation Law and as defining the practice of roentgenology as a branch of medical practice under the Education Law.

Your Committee took part in discussions for the adoption of a hospital fee schedule until it was ruled by the Attorney General, December 14, 1936, that under the amended Act the Industrial Commissioner has no authority to fix a minimum fee schedule for hospital care. Recently the New York Hospital Conference and the Brooklyn Hospital Council have taken exception to the action of the Industrial Commissioner in formulating Rule 22 of the revised Rules and Regulations governing Chapters 258 and 930 of the Workmen's Compensation Law, promulgated by the Commissioner December 1, 1936. This rule reads as follows:

Hospitals shall render bills for board and room accommodations, medical and surgical supplies, nursing facilities and routine laboratory services. Bills for all services rendered by physicians in hospitals, including physiotherapy, x-ray, pathology, anesthesia, medical and surgical care, etc., shall be made out separately and paid directly to the doctor rendering the service. Proper reimbursement by the physician to the hospital for materials and the use of facilities will not be in violation of Section 13-d-2 (e).

The hospitals in the Metropolitan area through the above Associations submitted a brief to the Attorney General protesting this rule and the interpretation of Section 13-f by the Industrial Commissioner.

Your Committee in turn presented its views contending that roentgenology, anesthesia, pathology, and physical therapy, are forms of medical practice and as such fees for these services should be

should submit bills for x-ray services or whether the physicians who are in charge of the taking and reading of x-ray plates should personally submit the bills for such services, we submit the following discussion of the law appertaining to the problem

Section 13-b, subdivision 3, Chapter 930 of the Laws of 1935, reads as follows

"Laboratories and bureaus engaged in x-ray diagnosis or treatment or in physiotherapy or other therapeutic procedures and which participate in the diagnosis or treatment of injured workmen under this chapter shall be operated or supervised by qualified physicians duly authorized under this chapter *and shall be subject to the provisions of section thirteen-c of this chapter* The person in charge of diagnostic clinical laboratories duly authorized under this chapter shall possess the qualifications established by the public health council for approval by the state commissioner of health or, in the city of New York, the qualifications approved by the board of health of said City and shall maintain the standards of work required for such approval"

From this section, it appears that a bureau engaged in x-ray diagnosis or treatment need not be owned by a physician, but must be operated or supervised by a duly authorized and qualified physician. Such a laboratory is subject to the provisions of Section 13-c of the aforesaid chapter.

The relevant portion of Section 13-c reads as follows

"S 13-c Licensing of compensation medical bureaus and laboratories * * * * The commissioner may, upon the recommendation of the medical society of each county or of a board as provided in section thirteen-b, authorize and license separate laboratories and bureaus engaged in x-ray diagnosis or treatment, in clinical diagnosis, or in physiotherapy or other therapeutic procedures, which participate in the diagnosis or treatment of injured workmen under this chapter. Application for such authorization shall be made on forms to be furnished by the commissioner and shall disclose in full the nature of the personnel and equipment of such bureaus. No such authorization shall be made in the absence of recommendation from the appropriate society or board. Each such bureau or laboratory which receives such authorization shall

(a) make reports on its personnel and equipment in such form and at such time as may be required by the commissioner, and

(b) be subject to inspection by the com-

missioner or the medical society of the county in which such bureau or laboratory is located, and

(c) pay to the commissioner a license fee of fifty dollars per annum for each office of such bureau or *ten dollars per annum for a separate laboratory*"

This section definitely makes lawful the licensing of such laboratories and bureaus engaged in x-ray diagnosis or treatment and prescribes the regulations to which the x-ray laboratory becomes subject. It also prescribes the license fee for such operation

The relevant portion of Section 13, subdivision a, reads as follows

* * * "*Nothing in this section shall be construed as preventing the employment of a duly authorized physician on a salary basis by an authorized compensation medical bureau or laboratory*"

From the aforequoted sections, it appears that it was the legislative intent to permit x-ray laboratories to perform their services without the necessity of functioning through a physician, except as prescribed by the law. The Laboratory must be operated or supervised by a duly authorized qualified physician, but the physician may be the employee of the laboratory.

If the physician is a mere employee, it does not seem reasonable that the employee should render the bill for x-ray services.

The proponents of the argument that physicians alone be permitted to render bills for x-ray services predicate their contention largely upon Section 13-f of Chapter 258, Laws of 1935. But it must be pointed out that the salient portion of Section 13-f reads as follows

"Payment of Medical Fees—Fees for medical services shall be payable only to a physician or other lawfully qualified person permitted by Section 13-b of this chapter to render medical care under this chapter, or to the agent or to the executor or administrator of the estate of such physician"

We read the words "payable only to a physician or other lawfully qualified person permitted by Section 13-b of this chapter to render medical care under this chapter" to contemplate the payment of fees to a lawfully qualified medical laboratory. Otherwise, there could be no explanation for the words "other lawfully qualified person permitted by Section 13-b" if physicians alone were intended by the words of this section. Paragraph 3 of Section 13-b makes specific reference to x-ray laboratories.

(2) Whenever his attendance at a hearing is required the physician of the injured employee shall be entitled to receive a fee from the employer, or carrier, in an amount to be fixed by the commissioner in addition to any fee payable under section one hundred twenty

The Committee held a number of conferences with representatives of the State Hospital Associations with the idea of clarifying certain provisions of the amended Act affecting both doctors and hospitals. After the formation of a joint committee combining representation from the State Society and the New York State Hospital Association, with Dr. Floyd S. Winslow as Chairman, many of the moot points were submitted to this joint committee on which your Committee was represented by two members. Meetings are now in progress.

It must be apparent to all that the Legislature has placed upon the organized medical profession a great responsibility under the amended Workmen's Compensation Law. It behooves the State Society and each local County Society to meet its obligations fully and faithfully in the highest interests of the people and to the end that the provisions of the new act may be carried out in so far as they devolve upon the profession with scrupulous fairness and in the spirit of the new legislation. That the confidence of the legislators will not be abused or its faith in our ability to succeed in carrying out even so difficult a medical administrative problem as the new law presents is augured by what we have accomplished up to the present and our plans for the future. Your Committee has been carefully observing administrative and medical practices under the new law. It has established important contacts with officials in the Department of Labor, with insurance carriers and their organizations, with representatives of employers organizations, and with representatives of Labor, and wherever possible has done its utmost to cooperate with these groups unselfishly and equitably.

Your Committee with the approval of the Society has recommended the appointment of a state-wide committee to study the Industrial Dermatoses and bring in a report with a view of setting up an adequate medical and administrative procedure in this difficult field. The Com-

mittee favors the setting up of a state wide committee on Rehabilitation to study and suggest methods of improving the medical and administrative procedure in this field. That your Committee may faithfully represent the interests of the whole profession in the State it has been recommended above that its number be increased to five.

Your Committee recommends that wherever possible each county society appoint, if it has not already done so, a special advisory qualifying committee to the Compensation Board, or to the Society whose function it shall be to set standards for qualification of physicians. Your Committee recommends that each county society keep its files of authorized physicians up to date and send to the office of this committee any changes in qualifications or any newly qualified names, and that the names of all bureaus approved or disapproved be sent to the office promptly. Your Committee strongly recommends that no change in principle or policy be inaugurated by any local society without conferring with this committee in advance. This is in the interest of uniformity and harmony. With the approval of the Executive Committee and the cooperation of the President a State Examining Committee has been appointed to assist the local county societies in qualifying roentgenologists under the Workmen's Compensation Law. Where any county society board is in doubt concerning the qualifications of a physician in accordance with the standards that have been approved for roentgenologists and submitted to each constituent society, the services of this special examining board may be enlisted by application to this committee. At stated intervals examinations will be conducted in the various parts of the State. Recently one such examination was held in the Metropolitan area for six applicants.

This Committee again recommends, as it did last year, an amendment to the Workmen's Compensation Law to give the Department of Labor authority to assess compensation and medical costs against a non-insured employer. It further recommends a provision in the law to fix a penalty for violations of the provisions of the amended law (Chapters 258 and 930 of the Law of 1935) applicable to all interested parties.

payable only to physicians regularly qualified under the law

The Attorney General's opinion is as follows

In yours of December 14th, you ask for my advice on S 14-f of Chapter 258, Laws of 1935, and the validity of Rule 22, adopted by you on the authority of said act.

Your Rule is not addressed to the situation of a payment already made to the doctor which presumably he had a right to receive but undertakes to regulate the hospital in the manner in which charges shall be made for services furnished by it and requires that bills for such service shall be made out separately and payable to the doctor who participated in the service without reference to the status of the physician as a staff doctor employed by the hospital under contract at a stated annual salary

After a careful consideration of the memorandum to the Industrial Commission, dated February 5, 1937, by Dr. Kaliski, the brief of Mr. Sol Ullman, Assistant Attorney General, the Report of the Leliman Committee headed by Dr. Pool, the Report of the Committee on medical and hospital problems to Governor Roosevelt (Howard Cullman, Chairman), the Research and conclusions of Justine Wise Tulin (109 pages) I am forced to the conclusion that there is no clear legislative intent to bar hospitals from charging for x-ray, physiotherapeutic and pathologic (laboratory) services

Where it is required that such services must be supervised by an authorized physician, where laboratories are allowed to be created for such purposes, where we know hospitals are equipped for such services and maintain staff salaried physicians to supervise and render those services, it would seem that a charge by a hospital need not segregate the service itself (materials, machine or room) from the salaried person's duties rendered in respect thereof. No such clear prohibition as is contended for can be read into the act.

The following confusion is created in the light of the construction contended for

1 The hospital may not render "medical services" under S 13-h, but its physicians may treat compensation cases under S 13-b(1 b)

2 "Medical Services" may not be rendered under S 13-h, but under S 13-b (1 c) and (3) x-ray, pathological and physiotherapeutic and laboratory services may be rendered

3 The hospital may charge for its "services" under S 13-g, but cannot collect because of S 13-f

4 Services of x-ray, physiotherapy, pathology, may be rendered (S 13-b-(1c), 13-b(3), and a physician must be maintained in connection therewith, yet the physician (paid on an annual

salary basis by the hospital) must be paid separately for such service

Neither the background nor the statutes support the arguments advanced. The legislature is now in session and if it is desired to enact any such stringent rule as that contended for, you should submit the matter to the legislature so that doubts will be resolved by its action.

In order that the intent of the law may be carried out your Committee recommends the submission to this Session of the Legislature a series of clarifying amendments, as follows

S 13-f Payment of medical fees (1) Fees for medical services shall be payable only to a physician or other lawfully qualified person permitted by Section 13-b of this chapter to render medical care under this chapter or to the executor or administrator of the estate of such physician. Medical services for the purposes of this chapter shall include medical, surgical, x-ray, physiotherapy, anesthesia, and pathological services. No physician rendering treatment to a compensation claimant shall collect or receive a fee from such claimant within this State but shall have recourse for payment of services rendered only to the employer under the provisions of this chapter. Hospitals shall not be entitled to receive the remuneration paid to physicians on their staff for medical, surgical, x-ray, physiotherapy, anesthesia, and pathological services

(1-a) A hospital may charge a physician in its employ, who renders x-ray, physiotherapy, anesthesia or pathological services under this chapter for the cost of materials and facilities. A schedule of such charges shall be filed with the Commissioner and shall be subject to correction by his order whenever there is evidence that such charge is not reasonably consistent with the true costs as established by the experience of specialists in the same or neighboring community. The schedule of charges shall be an adequate safeguard to the hospital for the actual costs of its materials and facilities but shall not operate as a division of the fee due the physician and convert such division to the revenue of the hospital

When a physician is on full time salary employment, a hospital may charge off against salary such net sums as accrue to the physician under the provisions of this section up to such ratio or proportion as the number of patients so treated or examined by such physician under the Workmen's Compensation Law bears to the total number of patients treated or examined by such physician under the terms of his contract

The increased attendance gave evidence of the lively interest of the profession in clinical medicine

At the Executive Session the following gentlemen were elected President, William C Buntin, M D , First-Vice-President, Theodore West, M D , Second

Vice-President Alexander N Selman, M D , Secretary, Isidore J Landsman, M D , Treasurer, Howard C Taylor, Jr , M D

Respectfully submitted,
TERRY M TOWNSEND, *President*

April 1, 1937

REPORT OF SECOND DISTRICT BRANCH

To the House of Delegates, Gentlemen

The activities of the Second District Branch for 1936 centered in the Thirtieth Annual Meeting which was held on November 19 at the Garden City Hotel, Garden City, Long Island. A group of exhibits and discussions were arranged, occupying the day from 10 A M until 5 P M. Six subjects were chosen, tuberculosis, diabetes, fractures, cancer, lead poisoning and diseases of the blood forming organs. For tuberculosis an extensive exhibit was arranged and a series of nine twenty-minute talks covering the entire subject were given. For fractures a series of five twenty-minute talks, treating the more common fractures together with an exhibit of x-ray pictures. In cancer a series of four talks, each lasting approximately one hour, illustrated by lantern slides and demonstrations. Lead poisoning, three talks, each one approximately one hour, together with an exhibit demonstrating the newer knowledge concerning this disease. Under diabetes and hematology there were three groups of four speakers, each representing different hospitals, covering the same subject in two hour periods successively. This afforded an opportunity for the individual physician to get three different viewpoints on the same subject, and with each of these extensive exhibits were used to illustrate the talks.

This program was unique and afforded an opportunity for a rapid postgraduate review of several important general subjects. It has demonstrated its value and with some improvements in the mechanical operation of the program it should be continued.

In the evening at the end of the banquet, Dr James R Reuling, Chairman of the World's Fair Committee of the Medical Society of the State of New York, and Vice-Chairman of the Committee Appointed to look after Medical Activities of the Fair, spoke on "The Doctor and the World's Fair." Dr Floyd S Winslow, President of the Medical Society of the State of New York spoke on "The Obligation of the Doctor." Approximately two hundred physicians attended the meeting during the day and many of them stayed for the whole day. During the business meeting which resulted in the election of Dr Irving Gray as President, Dr Albert E Payne as First Vice-President, Dr Louis H Bauer as Second Vice-President, and Dr Alec N Thomson as Secretary and Treasurer, a resolution was introduced and passed favoring the continuance of the District Branches of the Medical Society of the State of New York.

Respectfully submitted,
CARL BOETTIGER, *President*

April 1, 1937

REPORT OF THIRD DISTRICT BRANCH

To the House of Delegates, Gentlemen

The Third District Branch of the Medical Society of the State of New York held its annual meeting at the Ten Eyck hotel, Albany, September 22, 1936. About 150 members were present from the Counties of Albany, Columbia, Greene, Rensselaer, Schoharie, Sullivan, and Ulster, which comprise the Third District. The meeting was in charge of

Dr B W Gifford, president, Dr Augustus J Hambrook having resigned as president after his appointment as chairman of the Public Relations Committee of the Medical Society of the State of New York.

Dr Raymond F Kirchner, president of the Albany County Medical Society, gave a hearty address of welcome as the morning session opened. This was fol-

During the past year the Chairman of this Committee has addressed six District Branch meetings on the subject of Workmen's Compensation. He has addressed a number of county societies throughout the State and appeared before a number of medical societies in this and other states by invitation to discuss this subject. He also addressed groups of insurance representatives in various parts of the State. Numerous conferences were held with representatives of individual insurance companies, hospitals, local law enforcement agents and representatives of the Attorney General and the Solicitor General of the State. Eleven communications were published in the *STATE JOURNAL* which have been widely republished in County Society Bulletins.

Following is a financial statement of the Committee from March 1, 1936 to March 1, 1937

Rent	\$ 600 00
Salaries	705 30
Postage and telephone	145 21
Printing and stationery	194 05

Miscellaneous	24 00
Dinners	70 21
Railroad expenses	236 35
Drs. Kaliski and Elliott (for past services)	2,000 00
Director's salary	3,333 34
	<hr/>
	\$7,308 46

The Chairman wishes to express his sincere thanks to Dr. F. E. Elliott and Dr. B. Wallace Hamilton, members of the Committee, for their untiring help and support during the past year. Without their conscientious devotion the difficult task of the Committee could not have met with whatever success it has achieved. To the office staff, headed by Miss E. H. Wheeler, the Society owes a deep debt of gratitude for their unselfish and devoted efforts. To our counsel, Mr. L. J. Brosnan, the Committee offers sincere thanks and bespeaks the approbation of the Society.

Respectfully submitted

DAVID J. KALISKI, M.D.,
Chairman

April 1, 1937

REPORT OF FIRST DISTRICT BRANCH

To the House of Delegates, Gentlemen

The First District Branch of the Medical Society of the State of New York, comprising the Counties of Bronx, Dutchess, Putnam, New York, Orange, Richmond, Rockland, and Westchester, held its Thirtieth Annual Meeting at the Morrisania City Hospital on the 6th day of October, 1936.

The following program was presented

MORNING SESSION

"Operations for complete Prolapse of Uterus" Harry Aranow, M.D., F.A.C.S., and Staff

"General Surgery" George E. Milani, M.D., and Staff

"Urological Surgery," Terry M. Townsend, M.D., F.A.C.S., and Staff

"Current Pediatric Cases," Louis H. Barenberg, M.D.

"Unique Methods of Tonsillectomy" Clarence H. Smith, M.D., F.A.C.S., and Staff

"Pathological Demonstrations" William Aronson, M.D.

"Interesting Neuropsychiatric Cases" S. Philip Goodhart, M.D., and Staff

"Interesting Eye Cases" Thomas Hayes Curtin, M.D.

Luncheon

AFTERNOON SESSION

Introduction of Hon. S. S. Goldwater, M.D., Commissioner, Department of Hospitals, New York City, by Nathan B. Van Etten, M.D., F.A.C.P., President, Medical Board, Morrisania City Hospital

"State Society Problems" Floyd S. Winslow, M.D., F.A.C.S., President, Medical Society of the State of New York

"The Journal" Peter Irving, M.D., F.A.C.P., Secretary, Medical Society of the State of New York

"Compensation Medicine" David J. Kaliski, M.D., Director, Workmen's Compensation Bureau, Medical Society of the State of New York

"Neurosurgery" Sidney W. Gross, M.D.

"Demonstration of Unusual X-ray Films" Samuel F. Weitzner, M.D.

"Surgical Diabetes" Frederick W. Williams, M.D. and Thomas J. O'Kane, M.D., F.A.C.S.

"Radiation Therapy of Neoplastic Diseases" William Harris, M.D. and Samuel Richman, M.D.

"Cardiac Clinic" Edward P. Flood, M.D.

"Treatment of Fracture of Femur" William Klein, M.D., F.A.C.S.

"Grand Rounds and Demonstrations in Obstetrics" Harry Aranow, M.D., F.A.C.S.

There was a fair attendance considering the roughness of the weather

The forenoon was given over to clinical lectures on varieties of defects in the school Drs Greteman, York and Williams were the speakers Mr Robert Dineen, Attorney, of Syracuse gave a very instructive discussion concerning malpractice suits Dr Peter Irving and Dr Joseph Lawrence gave a resume on their activities in the State Society Syphilis Control, Maternal Welfare, and Pneumonia Control were covered in their topics

The Branch went on record by making a resolution to the Commissioner of Labor to have the same fee schedule in com-

pensation work as the Metropolitan area

In the afternoon session Dr Donald Guthrie of Sayre, Pa presented a paper on "Surgery in Peptic Ulcer" which was very thorough, and well-received by the members as it brought forth much discussion A paper on "Cardio-Vascular Syphilis" was given by Dr Edwin P Maynard This paper was also discussed at some length

The Branch has been in touch with its representatives and has communicated with them during the legislative session

Respectfully submitted,

MURRAY MACG GARDNER, *President*

April 1, 1937

REPORT OF SIXTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

The activities of the Sixth District Branch have been limited to two meetings The first meeting was a luncheon meeting of the Officers of the District and component County Societies, held at the Ithaca Hotel on May 28, 1936 The Executive Officer of the State Society, Dr Joseph Lawrence, was present at this meeting The main business of the meeting was a discussion of a tentative program for the Annual Meeting of the Sixth District Branch and the date set for September 17 Other matters of local interest to the District were discussed without any official action taken

The Thirtieth Annual Meeting of the Sixth District Branch held at Willard Straight Hall, Cornell University, Ithaca, September 17, consisted of a morning session followed by a luncheon and a second scientific session in the afternoon The scientific papers were presented in the Theatre of Willard Straight and the large Memorial Room was used for

demonstrations by the State Department of Health in connection with its Syphilis program, and a model demonstration of the physical plant of Biggs Memorial Hospital, recently opened at Ithaca

The meeting was attended by Floyd S Winslow, President of the State Society, David J Kaliski, Chairman of the Workmen's Compensation Committee and Peter Irving, Secretary of the State Society All three of the Officers of the Society presented short addresses during the Session The afternoon session was terminated by a paper on 'Diseases of the Lungs' by Chevalier Jackson, of Philadelphia

Several interesting exhibits of work being done by various Faculty Members of the Department of Physics at Cornell were made available and largely attended by those at the meeting

Respectfully submitted,

LEO P LARKIN, *President*

April 1, 1937

REPORT OF SEVENTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

In accordance with the Constitution and By-Laws, herein is submitted the 30th annual report of the Seventh District Branch

On September 24, 1936, for the first time since organization, the Seventh District Branch convened in annual meeting in Seneca County The place of meeting

was in Hadley Hall, Willard State Hospital on the east shore of Seneca Lake

The occasion was graced by the presence of the following officers of the State Society President, Dr Floyd S Winslow, President-Elect, Dr Charles H Goodrich, Secretary, Dr Peter Irving, Executive Officer, Dr Joseph S Lawrence Chairman of the Economics Com-

lowed by the following instructive scientific program a paper on "The Administration of the Workmen's Compensation Law," by Dr David J Kaliska, chairman of the committee on Workmen's Compensation, "Silicosis Diagnosis and Significance," by Dr D M Brumfiel, an address by Dr Edward S Godfrey Jr, Commissioner of the State Department of Health, a paper, "Fundamentals in the Treatment of Fractures," by Dr Herbert M Bergamini, "A Review of the Nasal Accessory Sinuses," by Dr John J Rainey Dr Floyd S Winslow, president of the Medical Society of the State of New York was present and spoke upon various timely subjects of interest to all State Societies Dr Peter Irving, Secretary of the Medical Society of the State of New York, also spoke on subjects in relation to the State Dr

Augustus Hambrook, chairman of the Committee on Public Relations, gave a brief talk on that subject

After luncheon at the Ten Eyck hotel, the following officers were elected President, Dr B W Gifford, 1st Vice-President, Dr L B Honeyford, 2nd Vice-President, Dr A M Dickinson, Secretary, Dr William M Rapp, Treasurer, Dr Ernest E Billings

I wish to thank all the officers, committees, and members of the Third District Branch for their attendance and for all their efforts to make this meeting a success I would especially thank the speakers at this meeting, and the Albany County Medical Society for their hospitality

Respectfully submitted,

BERTRAN W GIFFORD, *President*

April 1, 1937

REPORT OF FOURTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

Fine weather and a good program, together with a most excellent host—the Clinton County Society—made the Thirtieth meeting of the Fourth District Branch at Plattsburg, October 2-3, 1936, very successful

Our District is large in area, extending roughly from the Mohawk River on the south to the Canadian Border and from the St Lawrence River on the west to Lake Champlain Seventy men attended

A well-balanced program had been arranged and this is the crux of every successful meeting Unless members derive benefit from their efforts, attendance will diminish With such men as Drs James B Collip, Montreal, Lyman Allen, University Vermont Medical College, Edward K Cravener, Schenectady, Lewis M Hurxthal, Boston, Arthur J Vorwald, Saranac Lake, and George Beilby, Albany, presenting scholarly

papers, interesting discussions occurred throughout

Friday evening, October 2, the banquet was held at the Cumberland House where we were the guests of the Clinton County Society

State President, Floyd S Winslow, gave an interesting talk on "Crime Detection," illustrated by moving pictures State Secretary, Peter Irving, and Dr Joseph S Lawrence made pertinent remarks The high point was reminiscences by Dr John B Wheeler, Harvard '78, author, surgeon, and teacher

With the incoming officers we shall look forward to greater things and with Dr Carl R Comstock as President-Elect, we can feel assured

My thanks and appreciation to the Plattsburg men and to the essayists for their generous assistance

Respectfully submitted,

JOHN P J CUMMINS, *President*

April 1, 1937

REPORT OF FIFTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

The Fifth District Branch held its regular annual meeting on the first of October, 1936 at the Rome State School The

programs were held during the morning and afternoon sessions divided by an excellent dinner served by the Superintendent

Eighth District Branch was held at the Buffalo City Hospital, October 15, 1936. We had a very complete scientific session. The first speakers of the day were Dr. Allen Jones and Dr. Abel Levitt of Buffalo who gave a very instructive clinic on "Congestive Heart Failure and its Management." Following this Dr. Edward G. Winkler of Buffalo gave his unique motion picture film on different types of forceps and their application with a brief discussion of Maternal Mortality in Erie County by Dr. F. C. Goldsborough of Buffalo.

Luncheon was served at the hospital, cafeteria style.

Immediately following lunch we were honored with the presence of State President Dr. Floyd Winslow who gave us a brief talk on the duties of a physician. We were also honored by the presence of Dr. Peter Irving, State Secretary and Dr. D. J. Kaliski, Chairman of the Compensation Department for the State Medical Society. Each gave us a talk on their own field in the State Medical Society.

The afternoon session began promptly at two o'clock with a paper on "Silicosis,

Clinical Manifestations" by Dr. J. H. Donnelly and Dr. D. R. McKay with a complete roentgenological study by Dr. Clifford Orr. The last clinic in the afternoon was a fracture clinic conducted by Dr. Robert P. Dobbie and associates at the Buffalo City Hospital. This clinic brought out many new things, especially in the way of first aid treatment of fractures and their follow-up by repeated x-ray studies.

The meeting was well attended and the hospitality shown us at the City Hospital was most gratifying. The detail work done by the hospital department in scientific exhibits, pathology, bacteriology, roentgenology, etc., was most excellent.

The president of the district has been fairly active during the past year attending the State Executive Committee meeting each month, the State Council and Board of Censors. He has also reported to his district and county some of the newer things developed during the past year in state medical organization.

Respectfully submitted,

H. W. INGHAM, *President*

April 1, 1937

INDEX TO ANNUAL REPORTS

Officers and Committees

Arrangements, Committee on	769	Public Health and Medical Education, Committee on	765

District Branches

First District Branch	814	Fifth District Branch	816
Second District Branch	815	Sixth District Branch	817
Third District Branch	815	Seventh District Branch	817
Fourth District Branch	816	Eighth District Branch	818

muttee, Dr Frederic E Elliott, and Director of the Bureau of Workmen's Compensation, Dr David J Kaliski were also in attendance as speakers on the program

Despite the fact that the place of meeting was in the extreme southeastern part of the District and that the weather was very inclement more than one hundred were present and each component County Society was ably represented

The morning session was opened shortly after ten o'clock with Dr Winslow speaking on "Progress of the Society" Dr Kaliski followed on the subject "Problems and Progress of the Compensation Bureau" Dr Elliott then spoke on "Current Medical Economics" Dr Irving narrated in a very interesting manner the doings at "The State Society Office" Dr Arthur Krida, Professor of Orthopedic Surgery, New York University gave an erudite address on "Surgery of the Knee Joint," illustrating his talk by means of colored moving pictures, which depicted some original work Luncheon was served in Elliott Hall

During the afternoon Dr Edward G Winkler of Buffalo spoke on the subject "Miscellaneous Procedures in Gynecology," which was also illustrated by moving pictures, Dr W J Merle Scott of the University of Rochester talked on and illustrated by means of slides "The Differentiation of Benign and Malignant Lesions in the Gastrointestinal Tract"

It is a pleasure to make special mention of the manner in which the members and guests received what the State Officers had to present Each one came well-prepared and presented his material in a concise and brief address

Dr Harry J Worthing, Superintendent of Willard State Hospital, deserves much praise for the work that he and his subordinates did in arranging the theatre for the meeting and for the very fine luncheon that was served at bare cost to the Society

During the year your President was invited to and attended the annual meetings of Cayuga County and Broome County components, both of which exhibited a splendid degree of organization and an enthusiasm quite refreshing Noticeable to an unusual extent was the reposition of authority in young, earnest, and fervent leadership—an augur of enduring ideals An invitation received from Yates County was accepted but at the last minute had to be cancelled with regret As a member of the Executive Committee of the State Society your President has attended all monthly meetings except that held in January, from which he was excused by reason of pressing medical practice, he attended also the meeting of the Council in December

Throughout the District there has been observed unmistakable evidence of an awakened and eager-to-serve attitude on the part of the profession in all matters where cooperation in behalf of the State Society has been sought. The willingness and ardor displayed by the Chairman of Standing Committees in responding to invitations for the enlightenment of the physicians of this District cannot be passed without the recognition of comment, particularly are we indebted to Dr Frederic E Elliott and Dr David J Kaliski For aid and counsel in many matters and on numerous occasions the undersigned is deeply grateful to the Executive Officer, Dr Joseph S Lawrence and to the Secretary of the State Society, Dr Peter Irving

Several of the County Societies in the District have availed themselves of the postgraduate instruction afforded by the State Society Many favorable comments have been heard as respects the cooperation and consideration shown by Dr Farmer in arranging these courses

Respectfully submitted,

THOS W MALONEY, President

April 1, 1937

REPORT OF EIGHTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

The annual meeting of the officers of the Eighth District Branch consisting of the county presidents, district officers and Dr Joseph Lawrence from Albany, met

at the Hotel Statler, Buffalo, in May 1936 After a very interesting discussion of various scientific subjects our program was formulated for our fall meeting

The Thirty-first Annual Meeting of the

AMERICAN MEDICINE

EXPERT TESTIMONY OUT OF COURT

The American Foundation Publishes Report of its Medical Inquiry

The American Foundation made public on April 4, in a comprehensive report, the views of leading doctors and surgeons throughout the country on the present status of American medicine and on the problem of making "adequate" medical care available to the large part of the population that now fails to get it.

The report—which appears under the title, "American Medicine Expert Testimony Out of Court"—summarizes the results of an inquiry to medical men begun by The American Foundation approximately eighteen months ago. The doctors—chiefly those that have been in practice twenty years or more—were asked whether they feel that radical change in the present system of medical care is indicated, and, if so, in what directions. There was no questionnaire, the doctors were invited to comment freely upon all relevant points, and they did.

The report makes no recommendations, but in quotations from thousands of singularly sincere and spontaneous statements it analyzes profoundly and without reserve the *whole* structure of American medicine, presenting the whole picture—including, as one doctor puts it, the back of the house as well as the front.

Wide Interest for Laymen

Many of the questions raised have immediate interest for the layman. The questions are rather discussed than answered. Or rather for each question there are various answers. With the alternatives before him the reader can weigh and choose.

While the scope of the report is far too great to be indicated briefly, the following indicate part of the field.

What is "adequate" medical care?

Is the cost of it the only reason why it is not generally available?

How much modern scientific medical care of high grade exists at all?

If it were "available" now to all, would a large part of the population still choose quacks, cults, and patent medicines?

How far is government responsible for the health of the individual?

What part should government have in promoting public health and providing medical service?

Who should pay for the medical care of the indigent sick?

Is the old line of demarcation between preventive and curative medicine any longer practicable or desirable?

Is improving medical education and the personnel of the medical profession the first step in improving the organization and distribution of medical care?

Is there too much specialization?

Can an individual doctor really furnish scientific medical care alone or are organized laboratory and consultative assistance an absolute necessity?

In the medicine of the future will the practitioner function as an individual or as a member of a group?

What is the present status of the family doctor—is he "passing", or is a new version of him just coming into being?

Is the "doctor patient relation" an obsolete sentimentality or has it a practical value in modern scientific medicine?

Is there too much surgery?

How can self nominated specialists and ill qualified surgeons be controlled?

Now that the age of philanthropy is passing, how are hospitals to be supported?

Is insurance—three cents a day—or direct use of tax funds the answer?

Should the United States have a ministry of health and set up a Federal Department of Health in the President's Cabinet?

Which, if any, of the following is the answer to present problems: the status quo? compulsory insurance? various forms of voluntary insurance? thoroughgoing state medicine? evolutionary increase in governmental authority and functioning, integrated with private practice?

Sponsors of the Report

"American Medicine" is the first public report of The American Foundation Studies in Government since the Foundation entered the domestic field. Its work for the period from 1924 to 1935, was in the field of international law and international relations,

MEDICAL SOCIETY OF THE STATE OF NEW YORK

ANNUAL MEETING, ROCHESTER, MAY 24, 25, 26, 27, 1937

All meetings will be by Eastern Standard Time

House of Delegates

The regular Annual Meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10 00 A M on Monday, May 24, 1937, in the Chamber of Commerce

SAMUEL J KOPETZKY, *Speaker*

PETER IRVING, *Secretary*

Annual Meeting

The Annual Meeting of the Medical Society of the State of New York will be held on Tuesday, May 25, 1937, at 7 00 P M, in the Chamber of Commerce

FLOYD S WINSLOW, *President*

PETER IRVING, *Secretary*

Registration

Registration will be held in the Chamber of Commerce for Delegates on Monday morning, May 24, from 9 00 o'clock, for Members on Monday, Tuesday and Wednesday, May 24, 25, 26 from 9 00 A M to 6 00 P M

Exhibits

Scientific and Technical Exhibits will be located in the Chamber of Commerce

Scientific Sessions

General Sessions on Tuesday and Wednesday afternoons Section meetings on Tuesday and Wednesday mornings will be held in the Chamber of Commerce

Day of Entertainment

Thursday Golf—At the Oak Hill Country Club, where the Lilly Trophy as well as many other individual prizes will be available in competitive matches

The University of Rochester Medical School as well as other Rochester Hospitals will welcome visitors to their research laboratories

131st Annual Meeting

Chamber of Commerce—Tuesday, May 25, 7 00 P M

Calling the Society to order by the President, Floyd S Winslow, M D

Reading of the minutes of the 130th Annual Meeting by the Secretary, Peter Irving, M D

The Annual Banquet

The Annual Banquet will be held in Banquet Hall of the Chamber of Commerce on Tuesday, May 25, at 7 00 P M The Guest Speakers will be Dr Wingate Todd of Western Reserve University, Dr Gordon J Laing, formerly professor of English and Classics at the University of Chicago, and Carl W Ackerman, Dean of the Graduate School of Journalism of Columbia University

Requests for tickets and reservations for tables should be sent to James M Flynn, M D, Chairman, Banquet Committee, 277 Alexander Street, Rochester, New York Tickets will be \$5 00

Delegates' Dinner

Dinner for the Delegates will be served in the Chamber of Commerce on Monday following the adjournment of the afternoon session of the House of Delegates Tickets can be procured from the Secretary of the Medical Society of the State of New York, Peter Irving, M D, 2 East 103rd Street, New York City Tickets will be \$1 50

Public Meeting, Wednesday Evening —May 26

Eastman Theatre—"The Relation of Photography and Motion Pictures to the Science and Practice of Medicine"

Entertainments for Ladies

Monday evening, May 24—Dinner, Hotel Seneca for Woman's Auxiliary and all doctors' wives

Tuesday morning, May 25—Hobby show

Tuesday, May 25, 1 P M—Lunch at Oak Hill Country Club, followed by drive around the city

Wednesday morning, May 26, 10 A M—Trip through Eastman Kodak Co plants

Committee that reviewed an early proof include

James Alexander Miller, New York City, president, New York Academy of Medicine, former president (1936), American College of Physicians

I am astonished at the wealth of material and the masterly fashion in which it has been handled. Each chapter represents a mine of information.

Esmond Long, Philadelphia, president, National Tuberculosis Association

A monumental contribution to this difficult subject. There was never anything like it.

It is well balanced and representative. It was not "packed"—the criticism made of so much effort of this character. In the long run—when recommendations for action are made—those who decide what is best will find an abundance of sound opinion as a basis for action.

Hugh Cabot, surgeon at the Mayo Clinic, former president, Association of American Medical Colleges

A magnificent piece of work. Not only is there an immense amount of "opinion testimony," which is the legal phrase for expert testimony, but the material inserted as introductory and complementary to the expressed opinions shows a very profound knowledge of a very complicated and broad field.

Louis Casamajor, professor of neurology, College of Physicians and Surgeons of Columbia University, member, American Board of Psychiatry and Neurology

I have never seen anything like it before. Not only does it give a clear cut cross section of American opinion on the organization of medical care but it is an intensely human document of opinion on many of the most important phases of modern economic and social life.

The editing is superb and the report, I feel sure, will serve for years as a source book for much social research of all sorts. I expect to see it extensively quoted for many years to come.

J. Rosslyn Earp, director, Bureau of Public Health of New Mexico

An extremely important contribution to the science of government which will have influence far beyond the immediate problem of medical care with which the report deals.

Rapid Review of the Contents of "American Medicine"

The report falls roughly into two divisions, as follows:

The first seven sections describe present trends in medical practice and in medical education. They analyze without reserve what is wrong and what is right with American medicine today.

The last four sections discuss various proposals—social and economic as well as medical—for "distributing" medical care and lowering its cost, and for organizing medical care and public health services.

In other words, in the first (and the larger) part of the report the doctors discuss chiefly medicine itself. In the latter part they venture into the field of social and economic theory. The much greater space and emphasis given to the discussion of medicine itself is not without significance. Medical scientists do not see any possibility of separating the social and economic aspects of medical care from the quality of medical care itself, as a dominant and controlling factor in all planning.

A swift review, by sections, follows.

I

Is Adequate Medical Care Now Generally Available?

Since there is no general agreement as to what is "adequate" medical care and what is meant by "available," many agree that there is no categorical answer to this question. But if medical care is interpreted to mean the kind of care needed to enable citizens to maintain "positive" health, preventing incipient illness from progressing to serious consequences, as well as doing all that can be done to restore the sick individual to health, the weight of opinion is certainly that adequate medical care is not available. Even if adequate medical care is less ambitiously defined, this section contains a good deal of evidence in the form not of statistics but of direct picture (by men on the scene) to justify the premise that a large part of the population does not receive adequate medical care (a) because it costs too much, especially hospital service and the laboratory aids to diagnosis, (b) because it is too far away—as in the vast agricultural areas far removed from medical centres and without either hospitals or practitioners (c) because the public generally does not understand and is not asking for modern scientific medical care, much of the population definitely preferring quacks, cultists and patent medicines, and, finally and most important, (d) because in the

and its specific interest in the judicial settlement of international disputes

The Governing Committee for the Foundation's studies consists of Judge Curtis Bok, chairman, John G. Winant, former chairman of the Social Security Board, Mrs. Ogden Reid of the New York Herald Tribune, Roscoe Pound, former dean of the Harvard Law School, Thomas Lamont, Colonel Hugh L. Cooper, consulting engineer, Robert A. Millikan, physicist, James D. Mooney, president of General Motors Export Company, William Scarlett, Protestant Episcopal Bishop of Missouri, Mrs. Frank A. Vanderlip, president of the board of trustees of the New York Infirmary for Women and Children, Elizabeth F. Read, director of research, Truman G. Schnabel, associate professor of medicine in the University of Pennsylvania, and Esther Everett Lape, the member in charge of the Foundation's work, and editor of the present report. Elihu Root was a member of the Committee and for fourteen years its active advisor.

Judge Curtis Bok, in his foreword to the present report, explains that all the Foundation's studies are motivated by an interest in investigating the manner and the degree in which government may wisely serve its citizens within the limits of the parliamentary system—"if these are limits." In outlining the Foundation's characteristic technic in research, Judge Bok says:

We think that researches into the field of government are really important only in the degree in which they are accompanied by systematic and continuous education of all of us.

Our procedure is to present problems to competent groups and then to define the problems comprehensively by assembling all the factors brought forward in the free discussion that follows. We do evaluate the ideas, but under stern challenge from our collaborators.

The effect of this technic is to broaden the base of discussion, remove it from the narrowness of personal conclusion and emotional preference, take it out of the circumscribed field of superficial controversy, of argument by slogans and catch words, and make it possible to arrive at that comprehensive definition of any given situation that should certainly precede attempts to revise it, if any.

The technic noted here is carried out in the present medical report.

In the introduction to the report Dr. Truman G. Schnabel, the medical member of the directing committee, sets forth that

As in the case of other studies of the American Foundation, the study of the relation of government to health was begun with no assumption either that government should or that it should not play a larger part than it now plays.

The report, he points out, is intended to illumine the situation by taking all the pertinent factors into account.

There are more than one or two possible ways of revising the present organization of medical care. It seems axiomatic that no method of revision should be adopted until alternative methods have been weighed. We have wanted to etch in the present picture fully.

In sending our inquiry to doctors in the first instance there was no assumption that doctors alone could solve the problem. Social scientists, economists, government administrators have certainly a contribution to make. But it seemed to us that the group best able to define the problem in the first instance is the qualified medical men of the country. They should have a better idea of what constitutes adequate medical care than any economist or any government administrator. The very nature of their work, moreover, puts them in touch with conditions that are social and economic as well as medical and scientific. The objective of the Foundation's inquiry was not to poll the medical profession upon anything whatever, but rather to assemble ideas. *The intent and purpose of this report is to illumine and not to prove.*

Contributors to the Report

The doctors and surgeons that sent statements (the full list forms an appendix of the report) represent every state, all divisions of medicine, and all types of medical experience. The general practitioner in rural districts has a voice, the specialist in every field, the professor in the teaching hospital, the dean of the medical school, the research director and laboratory worker, the partner in the group clinic, the hospital administrator, the officer of the medical society, the director of public health work.

Medical Sponsors of the Report

A group of 134 medical men associated in a Medical Advisory Committee joins with the Foundation in presenting the report, commending it to the study of medical men and organizations throughout the country—as a comprehensive and fair summary of the views of their colleagues.

Comments made by the members of the

done about the illness, but much to be done about the situation it creates, and this principle should not be lost in seeking an adjustment of medical care

9 *Evolution versus revolution* in the reorganization of medical care While certain groups advocate sharp and complete change in the present reorganization of medical care, the view seems fairly general that even thoroughgoing change (which many believe is in order) will best be worked out by evolutionary process

10 *The quality of medical care must be the determinant in all planning* The physicians quoted in this section largely stress the point that no program of reform will succeed that is based wholly on economic considerations. They feel that social economists in the past, in dealing with the subject of medical care, have perhaps been more concerned with the cost and distribution of medical service than with the quality and character of the care itself. Medical care is neither a commodity nor a constant, and any distributive schemes that so assume are destined to fail. Very generally the view is expressed that the best service that can be rendered to those in need of medical care is first of all to improve the quality of medical care and the personnel of the profession. However the problem may be defined, it cannot be defined as making mediocre medical care available to a greater number of people.

Better medicine, say the doctors, is more important than better distribution and lower costs

III

Medical Education

Surprise has been expressed at the tremendous emphasis that falls on medical education in this report. A number of doctors, however, wrote that so long as, in their judgment so much remains to be done by way of improving medical care and the personnel of the medical profession, they consider discussion of costs and distribution only superficial. Leading educators and many medical men outside the teaching institutions express the view, indeed, that medical education is really *the key* to the solution of the problem of better medical care for more people.

The notable improvement in medical education during the past twenty-five years is duly recognized but the point is made that standards should be further raised, and, many feel, substandard schools closed by law

Since the quality of the medical man himself is, many insist, the determining factor in the quality of medical care, ways and means must be found for getting the best men to enter medicine—and for rejecting men not really qualified in all ways for the exacting requirements of a profession that is both a scientific calling and a public service. The personnel of the profession will not be what it should be so long as some medical schools accept students of doubtful qualification because their tuition fees are needed

In discussing what kind of training makes the best doctor, there is lively discussion of whether the emphasis in pre-medical training should be on the humanities or on science, some take the line that the pre-medical course should not have any stated content, and some believe its character and emphasis should vary according to the type of the individual and the character of his earlier education

As to the medical course itself, a question of major interest is whether the present tradition in medical education tends to over-stress laboratory technique and thus to produce the "super-scientist" rather than the clinician. Does medical education tend to neglect the training of the general practitioner? Some of those that discuss this question feel that while the old type of family doctor may be passing, a new and differently trained general practitioner will be the key man in the medicine of the future, and that the medical schools will have to take this into account

In the discussion of the medical curriculum there is a good deal of reference to the need of better training in obstetrics, which is so often the core of general practice, the situation in obstetrical practice and training, taking the country as a whole, is regarded as far from satisfactory

There is somewhat extended discussion, *pro* and *con*, on the need of giving psychiatry a much larger place in the curriculum, and an animated difference of opinion as to whether more psychiatry in the medical course would or would not make the doctor able to deal more satisfactorily with the human entity rather than with a disease

Whether the best teaching in medical schools is done by full time teachers or by "famous specialists" in practice also strikes fire. There is some sincere reflection on the type of teaching that habitually stresses

medical care of the present "the best is not yet good enough," to cite one of many spokesmen

The reasons why medical care is not yet good enough are many but these are the reasons most frequently brought forward by the physicians (a) there is a lag of years in applying new medical knowledge, (b) present medical training is not yet uniformly good, (c) present licensing is too broad, (d) too many graduates do not or cannot *keep up* their competence, (e) medical imagination still does not sufficiently perceive that prevention rather than cure is the real and ultimate goal of medical science, as many competent leaders of medical science in this discussion declare it to be

II

Views from Medical Men on the General Principles and Considerations Which, They Believe, Should Underlie the Organization of Medical Care

The problem of providing adequate medical care, as described in the preceding section, is obviously very complex, and there is no single simple solution for it. This correspondence is therefore analyzed in order to assemble the general principles and considerations which, in the view of these medical writers, should underlie the organization of medical care.

The views presented justify emphasis on ten outstanding principles

1 The problem of medical care is bound up with the social and economic problem as a whole and can be accurately analyzed only in this connection. Medicine, in the view of many students that express themselves in this chapter, must mesh with the gears of general society and of economics

A number of those that lack adequate medical care, it is suggested, lack also adequate *anything*, the real solution would be a living wage for everybody employable

Medical care, it is submitted by many, consists of many things beside medical advice and medicine. The achievement of public health involves factors besides medical science, the attack must be made upon a broader front.

There is the view that the depression has caused the present crisis (as to medical care) and that it will pass with the depression, and there is the contrary view that the depression merely revealed permanent defects hidden from the general view in more prosperous times

2 It is necessary to define the objective of medical science and practice—is it merely the care of the sick in illness or the promotion of "positive" health for the whole population?

3 Who is responsible for the health of the individual? It is necessary to define the extent to which, in a modern industrial society, with unemployment and lack of a living wage as permanent hazards, the individual can be held responsible for his own health

4 The public conception of health is a controlling factor "Adequate" medical care assumes a public that understands it, wants it, and is capable of receiving it. The present extent of quackery and the present wide use of nostrums emphasize the fact that a better educated public is a condition precedent to any nationwide plan for making adequate medical care generally available

5 and 6 The parties in interest are the medical profession, the public and the government and all three must "search together" if the answer to the problem of supplying adequate medical care to the whole population is to be found. The degree to which government has responsibility must certainly be predetermined

7 There is wide agreement on the soundness of the principle that the individual should pay (in some manner) in accordance with his capacity to pay, and that there is need for establishing indigence (by just and generous means and with no implication of delinquency) and of determining degrees of capacity to pay

A number express the view that there is abuse at present of facilities intended for the indigent and the "medically indigent" (those that generally pay their way but have no margin at all for medical care) and that this abuse raises costs for the middle class

8 There is animated discussion as to whether the doctor-patient relation and the free choice of physician are merely sentimental smoke screens or whether they do denote an essential principle in medical therapy. A general view is expressed that so far as they are real they can certainly be defined. It is admitted that the "art of medicine" has frequently been exploited at the expense of the science and that the doctor-patient relation ought certainly not to be made to serve as a substitute for diagnosis, but there is also the view that after the doctor-patient relation has been stripped of purely sentimental values genuine therapeutic values remain

While some writers refer to the doctor-patient relation and free choice of physician as "overhanded pieces," there are a number of expressions to indicate that medical service should go beyond the disease which has caught the patient and include that patient who has "caught" the disease. There is often little to be

On the abstract question of the value of the consultative principle in the practice of medicine there is little disagreement. But there is a good deal of disagreement as to whether the consultative principle can be incorporated and whether, if it can, group practice furnishes the incorporation.

The point is made that some of the groups now in existence represent the "incorporation" of one man's capacity or ambition rather than an attempt to base medical practice on the consultative principle. It is suggested that group clinics do not furnish the only means of applying the consultative principle, that every good doctor calls in a consultant when a consultant is needed, and that every hospital staff is an important form of group practice.

A contrary view is that the average practitioner does *not* consult except in unusual cases, or when the patient or the family request it, that if he did ask for consultation as often as it would be advantageous, the patient and family would often tend to regard his desire to consult as an admission of his own incompetence, and that these and other facts point to the need of consultation *as a system*, i.e., group practice.

There are varying views as to whether group practice lowers or raises costs—the answer really depending upon whether the particular case needs "the works" or not.

The focal points in good group organization are stressed—clarity in financial arrangements, cooperation (among the doctors inside the group, and with the doctors outside it), the presence of an "integrator," flexible spirit and procedure, periodic review and professional analysis of the group work.

The question is raised whether the closer organization of hospital staffs and development of their group functioning, and the drawing in of more practitioners into connection with hospital work may not mean that the real development of the future will be the hospital group rather than the independent group organization, or the "commercial" group of the present.

VI

The Place of the Hospital

This chapter refers to the progressive development by which the hospital has become the center both of medical practice and medical education. The community hospital is

suggested as one way of meeting present needs, in certain types of community. On the other hand, some views stress the danger of increasing the number of independent small hospitals, and the need to make sure that the establishment of community hospitals shall never run ahead of provision for adequate staffing of them.

Attention is called to the possibility of having community hospitals serve combined districts or groups of towns or counties.

The potential influence of every hospital on the quality of medical practice in the whole surrounding area is recognized by experienced or especially perceptive observers.

The location of hospitals is recognized as a focal point in the organization of medical care and it is recognized that planning on a national base is ideally in order if hospital facilities are really to be related to the needs of the population and the facilities of medical science.

Hospital costs are discussed and the possibilities of lowering them by cutting out the "frills," by simplifying the elaborate construction policy of recent years, and by unifying hospital management, regarding the interest of the patient as the controlling factor.

The financing of hospitals present and future is discussed, and reference is made to the two obvious (and perhaps rather alternative than concurrent) solutions to the hospital's financial problem—(1) hospital insurance, or (2) direct allocation of tax funds to hospitals in proportion to the amount of care they give to the indigent and the "medically indigent." There is concrete discussion of the questions of selecting, organizing—and paying—hospital staffs. It is recognized that either the open or closed staff will work if properly organized. Stress is rather generally laid on the need of better and closer organization of hospital staffs.

Hospital management and superintendence are reviewed. Finally, the place of the hospital in medical education is indicated and—potentially at least—in medical research.

VII

Public Health Organization

This includes a discussion of the United States Public Health Service, the state health

the rare and unusual case, without reference to the fact that the common ailments will probably constitute most of the young graduate's practice

The need of postgraduate training as a means of maintaining the competence of practitioners is discussed, with varying degrees of faith in brief "brush up" courses, but with general conviction that ways must be developed to make it possible for men who are not in regular touch with medical centres and who have limited opportunities for clinical observation to keep in touch with important developments in diagnosis and treatment.

The medical schools are presented as a logical center of research

The section on medical education concludes with a discussion of the present state licensing laws. The desirability of higher and uniform standards for licensure is set forth with a good deal of conviction. The present licensing provisions are rather generally characterized as too uneven and too broad. One group would recommend federal licensure—if constitutional obstacles could be surmounted. One group would have provisional licensure, making it necessary for practitioners to take re-examinations or otherwise demonstrate every five years or so that they have developed their ability and are competent in the practice of a rapidly developing science.

There is discussion of the practicability and value of having in every state a "basic science law" which would at least require every kind of practitioner of the healing art, whatever his cult, to demonstrate a certain amount of knowledge of the human body before permitting him to practice his particular brand of therapy

IV

Specialization

There is extensive comment on the drift toward specialization and the causes of it—the expanding field of medicine, the public's preference for specialists, the commercial rewards. The reply to the moot question whether there is over specialization, as one gathers it from these letters, is comparatively simple: there are too many poor specialists and there are not enough good ones. The qualified specialist is characterized as the finest development of modern

medical science. There is thoroughgoing discussion of the means of defining the requirements for specialized practice, including surgery regarded as a specialty. There is very frank discussion of the ill qualified and self-nominated specialists and also of the surgeon who achieves his competence—if he does achieve it—at the expense of the public.

The twelve certifying boards set up by the profession itself as a means of distinguishing between qualified and unqualified men in special practice and in surgery are commented upon at length. There is a difference of opinion as to whether these boards, as a voluntary measure without legislative sanction, will be able to regulate the situation, or whether in the end legislation will be required. There is rather general agreement, however, that in any case the boards are a step forward and will be the best guide to legislation if in the long run legislation should be needed. An appendix (II) supplies more detailed information on the methods worked out by the various boards for ascertaining whether a "specialist" or a surgeon has the proper training and above all the *experience* that justifies assumption of special practice.

Stress is laid on the actual and potential usefulness of the hospital in controlling standards, particularly of the surgical and obstetrical work done in the institution, the hospital can control by requiring consultation, under stated conditions, by a policy of reviewing each surgeon's work, by requirement of pathological examination (of all tissue removed by operation) and use of the results.

Postgraduate training for specialty practice is discussed, the difficulty of testing for *experience* is recognized but the need of such testing is regarded as unequivocal.

V

Group Practice

"Group practice" is used here with reference to groups of doctors and not with reference to groups of patients. The discussion in this chapter centers around the important question whether the field of medicine has indeed become too complex for the individual to deal with it adequately and whether or not the practice of the medicine of the future will be practice by specialists in groups.

On the abstract question of the value of the consultative principle in the practice of medicine there is little disagreement. But there is a good deal of disagreement as to whether the consultative principle can be incorporated and whether, if it can, group practice furnishes the incorporation.

The point is made that some of the groups now in existence represent the "incorporation" of one man's capacity or ambition rather than an attempt to base medical practice on the consultative principle. It is suggested that group clinics do not furnish the only means of applying the consultative principle, that every good doctor calls in a consultant when a consultant is needed, and that every hospital staff is an important form of group practice.

A contrary view is that the average practitioner does *not* consult except in unusual cases, or when the patient or the family request it, that if he did ask for consultation as often as it would be advantageous, the patient and family would often tend to regard his desire to consult as an admission of his own incompetence, and that these and other facts point to the need of consultation *as a system*, i.e., group practice.

There are varying views as to whether group practice lowers or raises costs—the answer really depending upon whether the particular case needs "the works" or not.

The focal points in good group organization are stressed—clarity in financial arrangements, cooperation (among the doctors inside the group, and with the doctors outside it), the presence of an "integrator," flexible spirit and procedure, periodic review and professional analysis of the group work.

The question is raised whether the closer organization of hospital staffs and development of their group functioning, and the drawing in of more practitioners into connection with hospital work may not mean that the real development of the future will be the hospital group rather than the independent group organization, or the "commercial" group of the present.

VI

The Place of the Hospital

This chapter refers to the progressive development by which the hospital has become the center both of medical practice and medical education. The community hospital is

suggested as one way of meeting present needs, in certain types of community. On the other hand, some views stress the danger of increasing the number of independent small hospitals, and the need to make sure that the establishment of community hospitals shall never run ahead of provision for adequate staffing of them.

Attention is called to the possibility of having community hospitals serve combined districts or groups of towns or counties.

The potential influence of every hospital on the quality of medical practice in the whole surrounding area is recognized by experienced or especially perceptive observers.

The location of hospitals is recognized as a focal point in the organization of medical care and it is recognized that planning on a national base is ideally in order if hospital facilities are really to be related to the needs of the population and the facilities of medical science.

Hospital costs are discussed and the possibilities of lowering them by cutting out the "frills," by simplifying the elaborate construction policy of recent years, and by unifying hospital management, regarding the interest of the patient as the controlling factor.

The financing of hospitals present and future is discussed, and reference is made to the two obvious (and perhaps rather alternative than concurrent) solutions to the hospital's financial problem—(1) hospital insurance, or (2) direct allocation of tax funds to hospitals in proportion to the amount of care they give to the indigent and the "medically indigent." There is concrete discussion of the questions of selecting, organizing—and paying—hospital staffs. It is recognized that either the open or closed staff will work if properly organized. Stress is rather generally laid on the need of better and closer organization of hospital staffs.

Hospital management and superintendence are reviewed. Finally, the place of the hospital in medical education is indicated and—potentially at least—in medical research.

VII

Public Health Organization

This includes a discussion of the United States Public Health Service, the state health

departments, county and local units. Co-operation between the federal and state public health agencies under the Social Security Act is discussed, and also provision for public health training under the Social Security Act.

One of the points of greatest interest discussed in this chapter is the relation, both traditional and potential, between the public health organization and the private practice of medicine.

There is a great deal of stress on the point that the time has gone by when the public health officer deals with prevention and the private practitioner with cure. Disease control and the health of the people follow no such sharp alignments of function and responsibility. The sources of cooperation between public health authorities and private practitioners, where cooperation has been achieved, and the causes of antagonism where opposition has characterized the relation of these two groups are cited. There is more than a little reference to a medical practice of the future when "preventive medicine" will be as largely practiced in the physician's office as in the public health department. This presages the growing importance of working out the true relation between the private practitioner and the public health officer.

Attention is called also to the need of a larger and a more creative dealing with preventive medicine in the medical schools, where it is now often an uninspiring, not to say a dull, subject in the curriculum. Reference is made also to the need of better training for public health work and a better relation of it to "orthodox" medical education.

VIII

State, County and Community Plans for Providing Medical Service

This chapter summarizes experiments made of late years to meet the needs of the indigent and the low income groups by various types of cooperative plans, sometimes between government and the medical profession, sometimes between the medical profession and social agencies, sometimes by the medical profession alone.

The sum of this discussion seems to show that these plans are less well developed than reference to them in some places would lead us to believe. The plans in operation cover

various examples of post-payment or credit bureau plans, examples of pre-payment or insurance plans, plans for the care of the indigent alone, etc.

A good deal of the emphasis on the importance of these plans ignores the fact that the question of post-payment or pre-payment is highly academic when people can not pay at all. Neither system reaches the indigent. It is recognized that experimentation is useful but that it is dangerous to depend entirely upon *procedures* where needs are fundamental. The *ways* of paying, a number of commentators point out, will not create the *means*.

IX

State Medicine

This chapter deals with state medicine in the thoroughgoing sense—i.e., government paid and controlled doctors.

The views in favor of state medicine in this sense rest on the premise that there can be no real distinction between public health and private health, that abuses in the present system such as fee splitting can be remedied only by state medicine, that state medicine, whether or not desirable, is *coming*.

The views opposing state medicine object to socializing medicine in an otherwise capitalistic system, express fear of political control, express distrust of governmental efficiency, fear jeopardizing research, destroying the doctor-patient relation.

State medicine in Sweden is briefly touched upon.

X

Health Insurance

The views on this chapter range all the way from those that regard general compulsory insurance as the answer to present problems to those that consider the principle of insurance in any form entirely inapplicable to the subject of health.

One group feels that only compulsory insurance can possibly meet the situation and that every one should be compelled to save for medical care.

General objections to the theory of insurance include the feeling that it always has a demoralizing effect on patients—and on doctors—i.e., both the givers and the receivers of services so arranged for, that

it is not suited to American institutions, and that it offers no help to the indigent the care of whom constitutes a grave part of the present need

Objections to insurance, in the more concrete discussion, include its assumed deteriorating effect on the quality of medical care, its limited coverage, its cost

The need for further study is stressed by those inclined to favor and those inclined to disapprove compulsory insurance.

Workmen's compensation laws are reviewed briefly, with reports on good and also upon undesirable results. Mention is made of the recent changes in the workmen's compensation law of New York State.

As to voluntary insurance the view is generally held that there can be no reasonable objection to individuals' and groups' insuring themselves as they see fit. Few seem to feel however that voluntary insurance furnishes a sufficient answer to present difficulties since it is admitted that those most in need of insurance either will not arrange to take it or cannot pay the premiums.

Hospital insurance is rather fully discussed and detailed accounts are given of hospital plans in operation in six places.

Both those that look favorably upon the more extensive development of hospital insurance and those more dubious about it agree that it seems to furnish one kind of answer to the present financial crisis of the hospitals, and also to the problem caused by the inability of the low income group to meet the cost of hospitalization especially. Those that believe, however, that in the long run tax support will be needed for hospitals feel that the hospital insurance movement may obscure for a time what they regard as the really permanent solution.

Points that emerge, as in need of particular consideration, from recent experimentation in hospital insurance include the lack of physical examination, the inclusion of x-ray, laboratory and other special services, the question of rates and reserves, the possibility of modification of hospital insurance plans for rural districts, the need of determining essential costs in hospital service, the need of reviewing the question of rates for dependents, the relation to diagnostic and therapeutic facilities, and to preventive measures.

Of course the moot question of including medical care in the insurance arrangement

recurs in the reference to some of the above points, and throughout the discussion generally.

This section concludes with a discussion of contract practice, a statement of the arguments for and against industrial group medicine, and illustrations of various forms of industrial group medicine and of contract practice.

XI

Limited State Medicine and Private Practice

This section assembles the proposals that appear in this correspondence for a further extension of government authority and government funds in the promotion of public health and the provision of medical services, integrated with the private practice of medicine.

The point of view most generally behind these proposals is that increased participation of government by evolutionary process is inevitable and desirable.

Many of the contributors to this chapter look hopefully toward an eventual merging of preventive and curative medicine, and regard insistence on separating them as reactionary and stupid. They believe that preventive medicine will more and more be practiced in the doctor's office and that it will some day be generally recognized that the resources of medical science and the energies of the doctor are properly to be devoted to the prevention as well as to the cure of disease. The better health of the race becomes the objective.

The development of the public health services, federal, state and local, is regarded as an outstanding possibility in the search for solution of present problems.

There is a brief summary of what has been done under the social security appropriations in the way of improving the public health services in various states.

It is pointed out that year after year additional diseases are considered to be "endowed with a public interest" involving governmental functioning. The list steadily increases tuberculosis, cancer, pneumonia, syphilis, have already an admitted "public" status, and there are, in various states, proposals for including diseases of the heart and circulatory system arthritis and other diseases which have been shown to be a

large factor in disability among the population and which require a treatment too long and too expensive to be within the financial compass of most citizens

The current attempt at venereal disease control comes in for special comment, and the need of cooperation between public health authorities and private practitioners is illustrated by reference to the methods required for detecting, diagnosing and treating this disease—and the impossibility of sharply separating the preventive and the curative functions in this case

One of the most urgent present problems, in general, is felt to be a definition of the truest and most productive relation between private practitioners and public health authorities, whose work, it is submitted, can less and less be sharply dissociated

A full development of both the preventive and curative aspects of modern scientific medicine makes necessary an integration of public health services with private practice—an intimate, understanding and cooperative development of "state medicine" and private practice—neither of which can apparently reach its ultimate development alone

There is a discussion of federal responsibility for providing medical care in sparsely populated communities and in areas where uncertainty of crops, drought and other hazards are characteristic and where state funds are also uncertain and obviously insufficient.

There is a summary of the large body of opinion that regards the medical care of the indigent as a logical and direct charge upon tax funds, local to the greatest practicable degree but with state aid, and federal aid under certain conditions and in certain places. In this connection the principle of federal grants-in-aid to the states is mentioned as the best means of working out on a nation-wide base, standards for the care of the indigent, always recognizing the need of variation according to local differences but recognizing also the need of *minimum* standards. Federal participation is suggested as the available means, under the constitution, for enabling states and localities to meet these minimum standards where, without federal stimulus and federal funds, states and localities either would not or could not do so

A Federal Department of Health is fre-

quently proposed as *justified* under the present powers and degree of functioning of the federal government in matters of health, and as *imperative* with the proposed increases in this functioning indicated by the present appropriations of the Social Security Act, and by such proposals as federal grants-in-aid for the care of the indigent sick, mentioned above.

There is a passing reference to the possibility of interpreting (presumably by constitutional amendment) the general welfare clause of the constitution to enable the federal government to establish a national health authority. If this is not done, even under the present constitutional limitations, the federal grants-in-aid principle, as already invoked by the Social Security Act, provides room for the evolutionary development of federal health functioning

The use of direct tax funds for hospitals is discussed, also the possibility of extending the facilities of tax supported laboratories in order that the scientific aids to diagnosis may be available to practitioners generally, and therefore to patients of all grades of income, at prices they can pay, and free to the indigent

The relation of government to medical education is not very fully discussed, but in addition to the point already cited under medical education—i.e., that medical schools can hardly control standards or select candidates for medical education according to a highly selective principle if they are dependent upon tuition fees—there is mention of other aspects of a possible relation between government and the medical schools, including a potential relation between university medical schools and public health services

In the discussion of government aid to research it is recognized that funds of large foundations and philanthropies have hitherto furnished a large part of the support of medical research. There is clear-cut indication that any planning for the organization of medical care on a broad base will need to include provision for competent research as the heart alike of preventive and curative medicine

Appendices

There are four appendices

The *first* gives the substantial content of

the letters of inquiry to the doctors, in order that the readers of this report may better interpret the doctors' replies

The *second* appendix contains a statement of the provisions established by "certifying boards" in twelve divisions of medicine, including surgery, for raising, by voluntary procedure, the standards of special practice and of surgery. There is a review of the methods chosen by the boards for establishing qualification both as to academic training and, more importantly, as to experience.

New York State Physicians Who Participated in the American Foundation's Inquiry on the Organization of Medical Care

- 1 Charles Gordon Heyd, New York City, President, American Medical Association
- 2 Willard C. Rappleye, New York City, Dean, Columbia University College of Physicians and Surgeons and Columbia University School of Dental and Oral Surgery, Director, Columbia University, New York Post Graduate Medical School, Professor of Medical Economics, Columbia University, Director of Study Commission on Medical Education
- 3 Arthur Wells Elting, Albany, Vice-President, American Surgical Association
- 4 George Hoyt Whipple, Rochester, Past President American Association of Pathologists and Bacteriologists, American Society for Experimental Pathology
- 5 Russell L. Cecil, New York City, Professor of Clinical Medicine, Cornell University Medical College
- 6 William S. McCann, Rochester, Physician in Chief, Strong Memorial and Rochester Municipal Hospitals.
- 7 William A. Groat, Syracuse, Chairman, Committee on Scientific Work, Medical Society of the State of New York.
- 8 Louis Casamajor, New York City, President of the New York Psychiatric Society
- 9 Arthur Freeborn Chace, New York City, President of Board, New York Post Graduate Medical School and Hospital of Columbia University
- 10 Lewis A. Couter, New York City, Consulting Physician, New York Hospital
- 11 Walter T. Daonreuther, New York City, President, American Board of Obstetrics and Gynecology
- 12 William Darrach, New York City, Dean Emeritus and Professor of Clinical Surgery, Columbia University College of Physicians and Surgeons
- 13 Willard J. Denno, New York City, General Medical Director and executive head of 22 industrial hospitals, Standard Oil Company of New Jersey
- 14 Nathan B. Van Etten, Bronx, Medical Director and President, Morrisania City Hospital, Speaker, House of Delegates of American Medical Association
- 15 Eugene F. Du Bois, New York City, Physician in Chief, New York Hospital, Medical Director, Rensselaer Institute
- 16 Edmund Prince Fowler, New York City, President, American Otological Society
- 17 Kendall Emerson, New York City, Managing Director, National Tuberculosis Association
- 18 Lewis Fox Frassell, New York City, Medical Director, St. Luke's Hospital.
- 19 Francis H. Glazebrook, New York City, Medical Director, New York Stock Exchange.

The *third* appendix is a list of industrial medical services approved by the American College of Surgeons. It is to be taken into account in connection with the discussion of contract medicine which concludes Chapter X on Health Insurance.

The *fourth* appendix consists of the list of the doctors and surgeons that contributed to this inquiry. It should be taken into account in connection with the introductory section summarizing the types of practice and the divisions of medicine represented by the "contributors."

- 20 Smith Ely Jelliffe, New York City, Consultant, Manhattan and Kiogs Park State Hospitals
- 21 Robert Hayward Kennedy, New York City, Surgical Director, Beckman Street Hospital
- 22 Samuel J. Kopetzky, New York City, Professor of Otolaryngology, New York Polyclinic Medical School and Hospital, Speaker, House of Delegates, Medical Society, State of New York.
- 23 George W. Kosmak, New York City, Editor, American Journal of Obstetrics and Gynecology, Consultant in Obstetrics, New York State Department of Health, Consultant, Federal Children's Bureau, Vice-President, American Gynecological Society
- 24 Walter L. Miles, New York City, Vice-President, New York Academy of Medicine, formerly, Dean, Cornell University Medical College.
- 25 Walter W. Palmer, New York City, Director of Medical Service, Presbyterian Hospital
- 26 William L. Russell, New York City, General Psychiatric Director, Society of the New York Hospital, Past President American Psychiatric Association, New York Psychiatric Society
- 27 Charles Hendee Smith, New York City, Professor of Pediatrics, New York University, University and Bellevue Hospital and Medical College
- 28 Frederic E. Soudern, New York City, Past President, New York State Medical Society
- 29 Frederick Tilney, New York City, Professor of Neurology, Columbia University College of Physicians and Surgeons
- 30 John Henry Wyckoff, New York City, Dean and Professor of Medicine, New York University College of Medicine.
- 31 E. William Abramowitz, New York City, Associate Professor of Clinical Dermatology and Syphilology, New York Post Graduate Medical School and Hospital
- 32 S. A. Agatston, New York City, Associate Ophthalmologist, Bellevue Hospital
- 33 Frederick M. Allen, New York City, Professor of Internal Medicine (Metabolism), New York Polyclinic Medical School and Hospital
- 34 W. P. Anderton, New York City, Associate Attending Physician, Presbyterian Hospital
- 35 Donald Budd Armstrong, New York City, Third Vice-President, Metropolitan Life Insurance Company
- 36 Helen Baldwin, New York City, Consultant to the New York Infirmary for Women and Children
- 37 Frederic W. Bancroft, New York City, Associate Professor of Clinical Surgery, Columbia University College of Physicians and Surgeons

large factor in disability among the population and which require a treatment too long and too expensive to be within the financial compass of most citizens

The current attempt at venereal disease control comes in for special comment, and the need of cooperation between public health authorities and private practitioners is illustrated by reference to the methods required for detecting, diagnosing and treating this disease—and the impossibility of sharply separating the preventive and the curative functions in this case

One of the most urgent present problems, in general, is felt to be a definition of the truest and most productive relation between private practitioners and public health authorities, whose work, it is submitted, can less and less be sharply dissociated

40 Louis Bauman, New York City, Assistant Professor of Clinical Medicine, Columbia University College of Physicians and Surgeons

41 Louis Faugeres Bishop, New York City, Consultant, Diseases of the Heart, Lincoln Hospital

42 Ernest P Boas New York City, Administrative Consultant for Chronic Diseases, Hospital Department of New York City

43 Wesley C Bowers, New York City, Attending Otolological Surgeon, St. Luke's Hospital

44 A A Brill, New York City, Lecturer on Psychoanalysis, Columbia University College of Physicians and Surgeons

45 Daniel Noyes Brown, New York City, General Practitioner

46 Jesse G M Bullock, New York City Clinical Professor of Medicine, New York University, practice limited to internal medicine, Visiting Physician, Harlem Hospital and Willard Parker Hospital College of Medicine.

47 Robert Burlingham, New York City, Assistant in Pathology, Cornell University Medical College.

48 Trigan Burrow, New York City, Psychiatrist

49 G A Carlucci, New York City, Visiting Surgeon Booth Memorial and Misericordia Hospitals

50 Thomas Hayes Curtin, New York City Eye Specialist

51 Annie S Daniel, New York City, Pediatrician

52 Morris Davidson, New York City, Ophthalmologist, New York State Department of Labor

53 William Van Valzah Hayes, New York City Professor Emeritus of Gastro-enterology, New York Polyclinic Medical School and Hospital

54 Albert Knecht Detwiler, New York City Internist.

55 John Douglas, New York City Consulting Surgeon, Knickerbocker, Bellevue, Harlem Eye and Ear Hospitals.

56 Cary Eggleston, New York City, Assistant Professor of Clinical Medicine, Cornell University Medical College, Associate Attending Physician, New York Hospital

57 Haven Emerson, New York City, Professor of Public Health Practice, Columbia University College of Physicians and Surgeons

58 Joseph Felsen, New York City Pathologist.

59 Robert T Frank, New York City, Gynecologist Mt Sinai Hospital

60 Rowland Godfrey Freeman, New York City Professor Emeritus of Pediatrics New York University and Bellevue Hospital Medical College

61 Percy H Fridenberg, New York City Associate Professor, Post Graduate Medical School and Hospital

62 A L Garbat, New York City Gastro-Enterologist.

63 John C A Gerster New York City Associate Surgeon, Lenox Hill and Stuyvesant Square Hospitals

64 Raymond Gettinger New York City, Pathologist and Director of Laboratory, New York Institute of Clinical Oral Pathology

65 Samuel B Beaser New York City Medical Service of Presbyterian Hospital

66 Elizabeth I Adamson, New York City, Neurologist and Psychiatrist

67 Alex Goldman, New York City General Practitioner

68 Malcolm Goodridge New York City, Professor of Clinical Medicine, Cornell University Medical College

69 Charles Graef, New York City, Eye, Ear, Nose and Throat Specialist.

70 Gaylord W Graves, New York City, Clinical Professor of Pediatrics New York University Medical College.

71 Francis D Gulliver, New York City, Attending Ophthalmologist, St Vincent's Hospital.

72 Henry Ewing Hale, New York City, retired.

73 Carl Gayler Harford, New York City, Pathologist.

74 T Stuart Hart, New York City General Practitioner

75 Isaac Hartshorne, New York City, Assistant Ophthalmological Surgeon, New York Eye and Ear Infirmary

76 John A Hartwell, New York City Consulting Surgeon, Bellevue, Reconstruction, General Memorial Hospitals

77 Robert A. Hatcher, New York City, formerly Professor of Pharmacology, Cornell University Medical College.

78 Alfred M Hellman, New York City, Associate Gynecologist and Obstetrician, Lenox Hill Hospital

79 W W Herrick, New York City, Attending Physician, Presbyterian Hospital, Sloane Hospital for Women

80 James Morley Hitzrot, New York City, Consulting Surgeon, Hospital for the Ruptured and Crippled.

81 Henry Lyman Hooker, New York City, General Practitioner

82 Peter Irving, New York City, Secretary, New York State Medical Society, and an Editor of New York State Journal of Medicine

83 Harry E Isaacs, New York City, Surgeon.

84 Herman Kantor, New York City, Internship, Harlem Hospital

85 Henry James, New York City, Internist.

86 Paul Allan Kaufman, New York City, Surgical Out Patient Department, Bronx Hospital

87 Henry Kendall, New York City, Gastroenterologist.

88 E L Keyes, New York City Professor of Urology, Cornell University Medical College.

89 L Winfield Kohn, New York City, Internist.

90 C. H Lavinder, Ellis Island, Chief Medical Officer, Ellis Island

91 Robert L. Levy, New York City, Professor of Clinical Medicine, Columbia University College of Physicians and Surgeons

92 B Liber, New York City, Lecturer on Mental Hygiene at the New York Polyclinic Medical School and Hospital

93 Alfred Lilienfeld New York City, Junior Assistant Physician New York Post Graduate Hospital.

94 Howard Lilienthal New York City Consulting Surgeon Mt. Sinai and Bellevue Hospitals

95 Ward J MacNeal, New York City, Director Laboratories of Pathology and Bacteriology of the New York Post Graduate Medical School and Hospital

96 Charles H May New York City, Consulting Ophthalmic Surgeon, Bellevue and Mt. Sinai Hospitals

97 Leo Mayer New York City, Associate Professor of Orthopedic Surgery New York Post-Graduate Medical School and Hospital

98 Marsh McCall, New York City, Internist.

99 Frank L. Meloney, New York City, Assistant Professor of Surgery, Columbia University College of Physicians and Surgeons

100 Alfred Meyer, New York City, retired.

101 James Alexander Miller, New York City President (1935-1936), American College of Physicians

102 C W Munger, Valhalla, President, American Hospital Association.

103 Josephine B Neal, New York City In Charge, Division of Applied Therapy, Bureau of Laboratories, New York City Department of Health, Executive Secretary, Matheson Commission, Encephalitis Research, Neurological Institute.

104 Arthur Edwin Neergaard, New York City, Associate Professor of Clinical Medicine Columbia University College of Physicians and Surgeons

105 John Joseph Nutt New York City Professor of Orthopedic Surgery, New York Polyclinic Medical School and Hospital.

106 Reuben Ottenberg New York City, Pathologist

107 Harold E B Pardee, New York City, Clinical Professor of Internal Medicine (Cardiology), New York Polyclinic Medical School and Hospital

108. Eugene Hillhouse Pool New York City, Senior Attending Surgeon, New York Hospital

109 J H Richards New York City, General Practitioner

110 Thomas Milton Rivers, New York City, Member, Rockefeller Institute for Medical Research.

111 Samuel S Rosenfeld, New York City, Associate Attending Gynecologist and Obstetrician, Lebanon Hospital.

112 Zachary Sagal, New York City, Internist.

113 Jesse F Sammis New York City, Assistant Professor of Clinical Pediatrics, Cornell University Medical College.

114 Henry Satterlee, New York City, General Practitioner

115 Carlo Savini, New York City, Visiting Surgeon Columbus Hospital

116 S W Schapira, New York City, Urologist

117 P J R Schmahl, New York City, Clinical Professor of Medicine, New York Homeopathic Medical College and Flower Hospital

118. M Schulman New York City, Assistant Professor of Clinical Medicine, Columbia University College of Physicians and Surgeons.

119 N Gilbert Seymour, New York City, Medical Director, Booth Memorial Hospital

120 Robert F Sheehan, New York City, Surgeon, Lieutenant Commander U S Navy, retired.

121 Clarence H. Smith, New York City Professor of Clinical Otolaryngology, New York Post-Graduate Medical School.

122 Arthur Woodward Booth, Elmira, Trustee American Medical Association

123 DeWitt Hendee Smith, New York City, Assistant in Medicine College of Physicians and Surgeons of Columbia University

124 Rufus E Stetson New York City, Specialist in Blood Transfusion.

125 Simon Strauss, New York City Adjunct Professor of Gynecology and Obstetrics, New York Polyclinic Medical School and Hospital

126 Howard Canning Taylor, New York City Gynecologist, Roosevelt Hospital.

127 Norman Edwin Titus, New York City, Physical Therapist.

128 Frederick T Van Beuren, Jr New York City, Associate Visiting Surgeon, Presbyterian Hospital

129 Jerome Wagner, New York City, Adjunct Professor of Proctology New York Polyclinic Medical School and Hospital.

130 Henry Wallace New York City, Attending Physician Emeritus Mountainside Hospital (Montclair, New Jersey)

131 Henry Wexler, New York City, General Practitioner

132 Allen O Whipple, New York City Director of Surgical Service, Presbyterian Hospital

133 Herbert B Wilcox, New York City Professor of Diseases of Children, Columbia University College of Physicians and Surgeons

134 A. O Wilensky, New York City, Chief of Surgical Service, Brownsville and East New York Hospital.

135 Fred Wise, New York City, Professor of Clinical Dermatology and Syphilology, New York Post Graduate Medical School and Hospital of Columbia University

136 Heinrich F Wolf, New York City, Specialist in Rheumatic Diseases and Physical Therapy

137 I Ogden Woodruff, New York City, Visiting Physician and Director, Bellevue Hospital

138 Louis T Wright, New York City, General Practitioner and Surgeon.

139 Floyd S Winslow, Rochester, President Medical Society of the State of New York

140 Morton Yohalem, New York City, Internship, Mt. Sinai Hospital

141 Henry Joachim, New York City, President, Medical Society of the County of Kings

142 Arthur J Bedell, Albany Attending Ophthalmologist St Peter's Hospital

143 Edward S Godfrey, Jr, Albany, Commissioner of Health for State of New York

144 Andrew MacFarlane, Albany Managing Editor of the Nelson Loose Leaf resigned (deceased)

145 Augustus B Wadsworth, Albany, Director, Division of Laboratories and Research, New York State Department of Health

146 Paul Harold Watson, Beacon, Associate Physician, Craig House Sanitarium.

147 William H. Ross, Brentwood, President, Suffolk County Department of Health

148 James H Borrell, Buffalo, Attending Urologist, Millard Fillmore, Lafayette General Hospitals, Buffalo Hospital of the Sisters of Charity

149 Byron D Bowen, Buffalo, Attending Physician, Buffalo General Hospital

150 Karl F Eschelman Buffalo, Director of Cancer Clinic, Buffalo City Hospital

151 Walter S Goodale, Buffalo, Professor of Hygiene and Public Health University of Buffalo School of Medicine.

152 Clayton W Greene, Buffalo Associate Professor of Medicine, University of Buffalo School of Medicine

153 James E King, Buffalo, Gynecologist in-chief, Buffalo City Hospital

154 Mansfield G Levy, Buffalo, Assistant in Pediatrics, University of Buffalo School of Medicine

155 Edward E Cornwall New York City, Attending Physician, Norwegian Lutheran Deaconess' Home and Hospital.

156 Frederic E Elliott New York City Chairman Committee on Medical Economics of New York State Medical Society

159 Paul C. Eschweiler New York City, Chief Diabetic Clinic, Methodist Episcopal Hospital

158 Laurent Feinier New York City, Attending Neurologist, Neurological Institute

160 Frederick H Flaberty Syracuse Past President (1934), Medical Society of the State of New York

161 Frank A Gallo New York City Clinical Assistant in Surgery Flower Fifth Avenue Hospital

162 Arthur Goetsch New York City Assistant Clinical Professor of Surgery, Long Island College of Medicine

- 163 Irving Gray, New York City, Attending Physician, Coney Island and Sea View Hospitals
- 164 Leon N Greene, New York City, Internship, Mt. Sinai Hospital
- 165 F J Parmenter, Buffalo, Professor of Urology, University of Buffalo School of Medicine
- 166 Homer Trotter, Buffalo, New York, Consultant U S Marine Hospital, Ear, Nose and Throat Specialist.
- 167 George Edward Barnes, Herkimer, General Practitioner
- 168 John C Holzberger, Hillcrest, Jamaica, Long Island, Eye, Ear, Nose and Throat Specialist
- 169 L. M Kysor, Hornell, General Practitioner and Surgeon
- 170 Rosslyn P Harris, Hudson, Radiologist
- 171 G W Cottis, Jamestown, Surgeon
- 172 Ira P Trevett, Lackawanna, General Practitioner
- 173 Lewis A Koch, New York City, Chairman, Committee on Medical Economics, Medical Society of the County of Kings
- 174 Joseph Krumsky, New York City, Attending Otolaryngologist, Beth Moses Hospital
- 175 M L Levy, New York City, Associate Surgeon, Beth Moses Hospital
- 176 William Francis McKenna, New York City, Associate Attending Urologist, Brooklyn Hospital

ANTI STORK TEA TABLE TOUTS

Sensational charges that touts canvass among women for illegal operations in London were made by a doctor at an Oxford Union debate on birth control

Dr William J O'Donovan, former MP for the Mile End Division of Stepney, consulting physician to the London Hospital and a well-known Harley Street specialist, said

"Wherever in London women collect together, whether at church tea parties, or political meetings, there may be present touts who canvass for illegal operations, and suggest people who would 'do' them

"I have had many women come to me at different times and tell me that they

had been approached by touts at meetings of various kinds," declared Dr O'Donovan

"Women patients have come to me after they have had an illegal operation and I have asked them how they got in touch with the person who performed it

"Their reply has very frequently been that people have approached them when they have been gathered together with other women," the London *News of the World* quotes him as saying

When asked who performed these illegal operations the doctor replied "Midwives who have been struck off the roll It must not be imagined for a moment that I meant that medical men are involved"

SERUM IN PNEUMONIA

That the physicians of the State may have concrete examples of different phases of anti-pneumococcus serum treatment of pneumococcus pneumonia, there will appear here case reports selected from the large number received by the State Department of Health on the use of anti-pneumococcus serum produced and distributed by it

In order that physicians practicing in New York City or those using effective serum from other sources may also be represented we hope that physicians who may have had particularly significant experiences with serum will submit short reports to the Pneumonia Editor, New York State Journal of Medicine, 33 W 42 Street, New York City—Editor

Case 6—Pneumonia Complicated by Pregnancy and Bacteremia

Report selected from the records of Lewis L. Klostermyer, M D, Warsaw

"A young girl, age eighteen, was admitted to the Wyoming County Community Hospital in a very serious condition on February 9

"The history of the present acute illness dated from the previous day when she developed the classical symptoms of pneumonia of sudden onset — namely, chill, fever, pleurisy, and a rusty appearing sputum. The previous history was relevant inasmuch as she was three and one-half months pregnant and had had severe pyelitis (colon bacillus) for one month before the present illness

"Examination showed a temperature of 102° F, pulse of 140, and respirations of fifty. The patient was prostrated, cyanotic, and appeared critically ill. There was dullness to percussion and distant bronchial breathing at the left base and generalized pulmonary edema

"Sputum examination showed the presence of Type I pneumococci and the blood culture demonstrated the presence of the same organisms

"There was no history of allergic manifestations nor previous serum injection. The intracutaneous and ophthalmic tests for horse serum sensitivity were negative

"Serum treatment with concentrated Type I antipneumococcus serum (New York State Department of Health) was instituted at 4 00 P M on the day of admission. Forty cc (50,000 units) were injected slowly without dilution. Following this, the dyspnea became less pronounced but no other significant improvement was observed. A second dose of 50,000 units was similarly given at 8 00 P M. Four hours later the temperature had fallen to

99°, the pulse to 110. There was very little dyspnea or pleural pain and the pulmonary edema had practically disappeared.

"The convalescent course was complicated by a localized empyema which was surgically drained on the seventh day of illness, and by the persistence of pyelitis and some evidence of toxemia. At the time of this report (six weeks after the onset) the patient is doing well and the pregnancy is continuing in a satisfactory manner"

The specific and life-saving effect of serum treatment in this instance is particularly obvious. Not only was the patient critically ill, almost moribund, but she presented two complicating conditions either of which alone would have made the prognosis extremely poor. First, the presence of bacteremia is always extremely serious. The case-fatality rate for Type I pneumococcus pneumonia with bacteremia, which is not serum treated, has been variously reported but is generally conceded as being between sixty and seventy per cent. Second, pregnancy may also be considered a factor of grave significance, particularly in the latter months. The available data on the effect of pregnancy while not as great in amount as that for bacteremia, is nevertheless sufficiently indicative of its seriousness to place it among the most unfavorable complicating conditions

While it is sometimes stated that serum treatment predisposes to the development of empyema, it is not definitely known at present what influence it actually has. It must be borne in mind that serum treatment serves to save the lives of patients with extensive blood stream invasion or other serious conditions, who would otherwise have died. In any such group, the incidence of localized secondary foci of infection such as empyema might readily be expected to be somewhat higher than in a group from which the more seriously infected cases had all been excluded by an early death

Hospital News

Courts "Crack Down" on Hospital "Sit-Downs"

THE CRASH OF BLACK-JACKS, NIGHT STICKS, axes, crowbars, and an operating table used as a battering ram shattered the quiet of the Brooklyn Jewish Hospital on March 15 as fifty police burst their way into two kitchens and a laundry, where groups of "sit-down" strikers had barricaded themselves. The sit-downers, armed with broomsticks and kitchen utensils, started to battle the officers, but were cowed with drawn pistols. Eighteen strikers and the president of their labor-union local were arrested on a court order charging them with endangering the lives of patients by refusing to work, in violation of section 1910 of the penal law. The strike was called for union recognition and higher wages and the reinstatement of a discharged telephone operator.

Two days later another sit-down strike in the same hospital was staged, but all the strikers left peaceably upon the demand of the hospital authorities and the police except thirty-nine, who were arrested and taken to the station and booked on disorderly conduct charges.

These incidents assume importance in view of the current contagion of sit-down strikes and the efforts of labor leaders to organize hospital workers and present various demands. Two magistrates expressed their opinions on the two Brooklyn strikes, and their views are of interest to all hospitals in the State as perhaps giving a line on the attitude of the courts in such cases.

When the first lot of eighteen strikers and their president were arraigned before Magistrate Mark Rudich in the Flatbush Court on March 16, he held them for trial in Special Sessions under the penal law mentioned above, and said:

There was a clear breach of contract when these defendants refused to serve food. When the interns and nurses had to leave the hospital to get food, they could not be on hand if their services were required quickly.

It is enough if a human life might be endangered. They must be under the same roof to be available. That is why nurses and doctors live in a hospital. These people are just as important to the care of the patients

as the doctors and nurses who take the Hippocratic oath.

The thirty-nine arrested on the 17th also came up before Magistrate Rudich on the 18th. He adjourned the hearing to a later date, and said to them:

You hospital workers are in a different situation from the ordinary employee in a factory or store.

As I construe this section of the penal code it means simply this: If the employment is such that giving it up means that lives might be endangered, you can't quit.

I don't mean by that that the employee is bound to servitude as long as he lives, but I do mean that if he wants to quit he must give notice, reasonable notice as to afford the employers reasonable opportunity to replace him with some one else in order that human lives might not be endangered.

He can't quit on a moment's notice any more than a fireman or a company of firemen can quit while a building is burning.

Further, if you do quit after reasonable notice, you must leave the hospital at once, so that the person who is to replace you may carry on your job. Furthermore, you must not only quit and leave the building at once but you must leave the vicinity at once.

You can't stage a demonstration in front of the hospital as you may perhaps have the right to do in front of a factory or store. The inmates, patients, in an institution must not be disturbed by confusion, turmoil and noise incident to a labor demonstration such as we have become familiar with in recent times.

On March 24, thirty-eight of the thirty-nine were found guilty of disorderly conduct when arraigned before Magistrate David L. Malbin in the Flatbush Court. He sentenced them to thirty days each in the city prison, but suspended sentence pending their good behavior, which he defined as not doing anything to interfere with the routine of the hospital. He said later this included picketing. If the defendants do anything to interfere with the hospital, he warned, they will be rearrested and the jail sentence enforced.

The court also held the thirty-eight for trial in Special Sessions on a charge of violation of Section 1910 of the Penal Law,

which concerns the endangering of life by refusing to work

In his decision, Magistrate Malbin reviewed the testimony and continued

No one denies that labor employed by private enterprise has the right to strike or picket to secure adequate compensation for their services or proper working conditions. A healthy place to work and an honest living wage for the employee are universally approved. However, the method to secure these conditions can and must only be by lawful means.

The attempt in this case to confiscate hospital property by taking possession of any part

thereof when ordered out of the premises clearly is a violation of our law.

The hospital in question earns no profit that it refuses to share with its employees. It is supported by the poor and rich alike, by contributions it receives from the public and part payment for some of its free cases from the City of New York. It gives service to any one regardless of race, creed or color and maintains a free dispensary for those unable to pay for necessary medical service.

Its daily patient census is from 500 to 600, and must necessarily have a great number of cases which are acute and at danger's point. On the day in question they also had seventy newborn babies in the pediatric department.

A Gas Attack that Went Wrong

A SERIES OF VIOLENT NEWSPAPER CRITICISMS raking New York City hospitals conducted by Dr Goldwater's department have had the happy result of bringing down on his head a handsome shower of bouquets. It is a scientific law that action and reaction are equal and opposite, but in this case the reaction in Dr Goldwater's favor has gone far beyond the original onslaught. It is something like a poison-gas attack that is met by a contrary wind and carried back upon the enemy lines.

People who know the hospital situation in New York City have been well aware of the steady, fine, quiet improvement going on in the past three years, but no one was saying anything especially about it. Then came these blasting broadsides in the Hearst papers, and turned out to be exactly what was needed to start everybody saying the good things they had been thinking all the time.

For example, no one could speak with more knowledge and greater authority than Dr Haven Emerson, of Columbia University, Director of the Hospital Survey for New York. His very position would impel him, if things were wrong, to say so. Instead, he declared in a public address on March 2, directly after the attacks appeared.

Probably never in the history of the city has there been so uniform and exceptional a competence of care of the sick in our public hospitals from superintendent to kitchen help, from chief surgeon to the intern riding the ambulance; from director of nurses to the probationer just entering on her training.

It has been our great good fortune that the care of the sick for these past three years of increasing congestion of hospital wards has been in the hands of Dr Goldwater, whose

experience, resourcefulness, integrity, and entire freedom from political pressure or influence have transformed all the city's twenty-four general and special hospitals and their more than fifteen thousand beds from liabilities to assets, from constant causes of justifiable complaint to sources of accumulating gratitude and appreciation alike by patients and their friends.

Everyone may not know that there is a New York City Visiting Committee of the State Charities Aid Association, whose visitors inspect the hospitals regularly and frequently, and report candidly what they find. The president of the committee is Mr Homer Folks, who is so highly thought of in the hospital world that a big tuberculosis sanatorium has been named after him. Well, in the course of a letter to Mayor La Guardia, after the criticisms came out, he wrote

May I take this opportunity, in behalf of the New York City Visiting Committee to again place on record our unqualified admiration and appreciation of the work of your Hospitals Commissioner, Dr S S Goldwater. We speak with intimate knowledge of the day-by-day condition of these institutions over a long period of time.

Our visitors, including several score of volunteers as well as experienced staff members, make frequent visitations to all of the hospitals in the Department. We are, therefore, in a position to know how the needs of the patients are being met—whether the nurses are qualified for their tasks and devoted to the care of their patients, and all the other details which enter into the humane and efficient care of sick persons.

All these visitors report that exceptionally effective plans are being carried out in all the departments of hospital administration, that

long-standing difficulties and shortcomings are being discovered and corrected that wise, long-range plans are being made for the development of hospital facilities in the places and for the purposes for which they are most needed, and that from top to bottom the staff of the Department derives encouragement and devotion from the deep interest on the part of the hospital administration in the humane and scientific provision for the varied needs of the patients

Although much remains to be done in the way of hospital construction, equipment, and staff, it is a simple truth to say that the needs of the sick poor in the public hospitals of this City have never received such intelligent, continuous, and competent attention as they are receiving under your Commissioner of Hospitals

Many similar compliments for the Commissioner might be quoted, but they are unnecessary

The newspaper that made the onslaught picked the time in midwinter when all the hospitals were crowded far beyond capacity with victims of respiratory and other ailments. Cots overflowed into hallways and into any other space available. Nurses and doctors went without food and sleep and had more patients than they could well care for. The ambulances had more calls than they could answer promptly

Splendid! An ideal situation for a muck-raking crusade! Sick people shoved out in the hallways! Disgraceful! Interns and nurses worked to death! Little babies neglected. Dying people have to wait for the ambulance! Et cetera, et cetera. Disgruntled employees and patients were quoted at length as gospel truth

One young woman of the Junior League was swept off her feet and wrote an article headed "Treatment of Aged Sick Called Criminal," which was published with her smiling photograph. The immediate result was a letter to Dr Goldwater from the President of the Junior League apologizing

for and disavowing the article, and another from the Chairman of the Junior League Auxiliary functioning at the City Hospital, Welfare Island, who said

I feel terribly bad that a Junior League girl should have written such an outrageous article

I have never seen anything but kindness and courtesy shown to the patients by the doctors and nurses over a period of five years

As far as crowding is concerned, it is fortunate that there is somewhere for sick people to go

How Dr Goldwater himself feels about it may be seen from a letter to the *STATE JOURNAL*. He writes in part

To the Editor

NEW YORK STATE JOURNAL OF MEDICINE

Shortly after the *Journal* began its series, the City Editor assured me that he would publish my comments. Following the publication of the first two articles, which represented in my opinion a malicious distortion of facts, I commented as promised, but publication of my statement was refused. I have offered to make further statements, but the *Journal* is not hospitable to the idea of correcting its falsifications, distortions, and half-truths

In the meantime, organization after organization, medical and civic, have taken a stand on this matter and have, I hope, made it unnecessary for me to do anything further in regard to it. The malice of the *Journal's* attack seems to be recognized by the other newspapers, not one of whom has paid any attention to the *Journal's* alarm

On the testimony of disinterested observers within and without the Department, I rest my case. I have only one plea to make and that is that decent organizations use their influence to defeat the efforts of politicians to drag the Department back to the position it occupied in the past, where it was the subject of constant interference and degradation in the interest of political partisans

Yours sincerely,

S S GOLDWATER, M D
Commissioner

At the Helm

DR. WILLIAM S BUSH has been elected chief of staff of the Benedictine Hospital of Kingston, succeeding the late Dr Mark O'Meara.

• • •

DR. RAY PALMER BAKER, assistant director of Rensselaer Polytechnic Institute, was re-elected president of the Board of

Directors of the Samaritan Hospital in Troy for his third term at the annual hospital meeting

• • •

AT THE BUSINESS MEETING of the Dobbs Ferry Hospital Mrs N Reynolds Brooks was elected president.

THE WOMAN'S AUXILIARY

The Woman's Auxiliary to the Medical Society of the State of New York cordially invites the wives of all the members of the Medical Society of the State of New York to attend the 2nd Annual Convention to be held in the Hotel Seneca, Rochester, on May 24, 25, 26, 1937 (This Convention will be held simultaneously with the 131st Convention of the State Medical Society in Rochester, New York)

There will be a Hobby Show open Monday from 2 P M-10 P M, Tuesday from 10 A M-10 P M, and Wednesday from 10 A M-2 P M, at which the hobbies of doctors and wives will be exhibited. The interest already displayed in obtaining the exhibits augurs well for an even bigger and better show than the one at last year's Convention, at which over 200 exhibits were shown. It is truly amazing to discover the variety of hobbies to which doctors have turned their attention.

At 11 A M on Monday there will be a meeting of the House of Delegates which all doctors' wives may attend and learn what the Woman's Auxiliary has accomplished during the year.

At 7 P M dinner will be served in the Palm Lounge of the Hotel Seneca. We hope all doctors' wives will attend. It is an excellent opportunity for women from all parts of the state to meet each other socially. A delightful entertainment will be provided.

Tuesday the Rochester women will entertain us at the Oak Hill Country Club (transportation will be provided). A drive to see the city has been arranged by these same gracious hostesses.

Of course you will attend the State Society Banquet at 7 o'clock. That is always a big event. It is the time to introduce the doctors to the Auxiliary members and friends.

Wednesday morning will be the last opportunity to visit the Hobby Show. Don't leave the Convention without spending at least an hour marveling at the doctors' handiworks.

There will be many things of value and interest at this Convention, and we hope you will attend. A Convention is interesting, because it brings out many types of women.

To wit, there is the new delegate who absorbs everything, takes copious notes, gathers souvenirs and pamphlets to take

home and is full of the spirit of the Convention. She will be valuable to her Auxiliary, because she will carry back enthusiasm and purpose.

There is the sophisticated delegate who will attend a few of the sessions, look properly bored, and will take back to her Auxiliary only a few facts and much criticism.

Then there is the dyed-in-the-wool delegate who carries constantly a large note book and many pencils, never misses a meeting, has no time for a chat, or even a powder puff or a cup of tea, she will undoubtedly inform her Auxiliary how a Convention should be conducted.

There are those who believe everything that is said, and those who believe nothing that is not clearly proven—those who pronounce everything 'just perfect,' and those who magnify the failures beyond recognition and are happiest when they find the most flies in the ointment.

Then there are the leaders who wear the mantle of responsibility and are always true to form. For all there will be speeches, reports, introductions, questions, dinners, luncheons—interesting or dull—headaches, tight hats, perhaps shoes too snug for comfort, incomplete quotations, illegible notes, etc—but I believe that out of it all will come as if by a miracle, stronger loyalties, better friendships, and a new impetus for service.

Fate has a strange way of bringing unity and order out of chaos—so come armed with reason, tolerance, and with a keen sense of humor—for you will need every one of these. Be prepared in your admiration of leaders and confidence in your fellow workers, that they are after all but human. Remember that no one has ever been perfect in every virtue. Finally, may I admonish you that your personal disappointment should not in any way impair your loyalty to the Auxiliary itself. The object of the Auxiliary and the service it can render far exceed in value the wishes of any individual or group of individuals.

Therefore let me urge you to plan your engagements so that you may attend this, the 2nd Convention of the Woman's Auxiliary to the Medical Society of the State of New York. I feel certain you will enjoy it immensely.

MRS JOHN L. BAUER, *President*

JAUNDICE

CHAS GORDON HEYD, B A , M D , F A C S , *New York City*
Professor of Surgery, New York Post-Graduate School, Columbia University

Clinical jaundice is a discoloration of the body tissues and of the body fluids by an excess of bilirubin. Descriptions of jaundice occur in our earliest medical literature and clinical jaundice is described by the classical writers of antiquity. As a clinical phenomenon jaundice varies in intensity from a slight subicteroidal tinge to the intense black jaundice or melas icterus found in conditions with complete obstruction of the common duct, such as occur in carcinoma of the head of the pancreas.

Jaundice in a chemical sense is due to an excess of pigment—bilirubin—circulating in the blood system and being deposited in the tissues and giving the yellow coloration to the body fluids. The clinical interpretation of icterus may be initiated by determining the source of bilirubin. With normal and pathological destruction of red blood cells or hemolysis there is derived hemosiderin (an insoluble iron-bearing molecule) and hematin (a soluble molecule). By rearrangement of the atoms in the molecule of hematin there is derived an isomer called bilirubin. An extensive literature representing long and patient research has appeared explaining where this rearrangement of atoms for the production of bilirubin takes place. Bilirubin can be produced from hematin in the liver, the spleen, and the reticulo-endothelial system. Bile salts, however, can only be produced in the liver. It was assumed until recently that all jaundice was produced either by a disturbance of the liver itself or by an obstruction of the bile

ducts. Virchow many years ago indicated, however, that jaundice could occur by the extravasation of blood into the body cavities and predicated a jaundice that arose entirely outside of the liver.

The liver briefly is concerned with the excretion of bile, the metabolism of carbohydrates, the analysis and synthesis of proteins. Bile, largely an excretory product, contains bile pigment—bilirubin, bile salts, cholesterol and small quantities of inorganic material—calcium and bicarbonates.

Van den Bergh assumed that icterus was entirely due to an increase of bilirubin in the serum and upon utilizing the color reaction given by bilirubin with the diazo reagent of Ehrlich, he was able to make the original observation that in some cases of jaundice it was necessary to bring the bilirubin into alcoholic solution before a color reaction could be obtained, while in other cases the adding of the icteric serum directly to the diazo reagent brought about a color reaction. He, therefore, made the very important distinction that in the icteric group there were two distinct kinds of sera: *first*, sera which gave a color reaction at once or immediately upon the addition of diazo reagent directly to the sera, the so-called "prompt or immediate reaction," *second*, sera which gave no color reaction, or only after a long delay on the addition of the diazo reagent directly to the sera, the so-called "delayed reaction." Van den Bergh supposed that a prompt direct reaction was obtained only from a bilirubin that had passed through the poly-

gonal liver cells and had subsequently been absorbed because of obstruction. On the other hand, if the sera gave a delayed reaction he assumed that the bilirubin had been formed independently of the liver cells and in addition had not passed through them. If this thesis be correct then there are two kinds of bilirubin that may cause jaundice. That this contention is supported by clinical facts is evidenced by the following: (1) Bile from the gall-bladder always gives a typical prompt direct reaction—this bile has obviously passed through the liver, (2) bilirubin obtained from the serous fluids, in hemorrhagic effusions in the chest or abdomen, or knee joints, gives the delayed reaction only, or generally not at all. Such a bile pigment has been elaborated independently of the polygonal cells of the liver.

It is the cells of the reticulo-endothelial cell system, and particularly Kupffer's cells in the liver and the reticular cells of the spleen, which are concerned with the breaking down of hemoglobin into bilirubin. Bile pigment, hemosiderin, and fragments of red corpuscles have been seen repeatedly in both these types of cell, but particularly in Kupffer's cells of the liver. It would seem then that splenic tissue, without and within the liver (Kupffer's cells) and not the liver cells *per se* plays a very prominent part in the formation of bile pigment. On the other hand, not the slightest proof has been brought forward to substantiate the hepatocellular formation of bile pigment. Jaundice may then arise theoretically from the obstruction of the outlet of the bile capillaries after the changed bilirubin has passed through the polygonal cells of the liver or it may occur by reason of the fact that the bilirubin has not passed through the polygonal cells but is absorbed by the vascular capillaries or lymphatics of the liver into the general circulation. The former would be the elimination of an altered bilirubin with bile salts and subsequent absorption from obstruction; the second would be the absorption of an unaltered bile pigment and without bile salts. It is this conception of jaundice that explains the two reactions of Van den Bergh's test. It seems possible therefore to predicate inferentially two different

kinds of bilirubin. While these have not been experimentally or clinically demonstrated, the behavior of bilirubin in varied conditions of jaundice allows this assumption. It would seem that there is a normal content of bilirubin that at all times is circulating in the body. A portion of this bilirubin, which we may call Bilirubin A¹ is taken out by the activity of the liver cells and eliminated in the bile. This bilirubin is possibly of no use to the organism and represents a waste product in the process of excretion, for by its concentration or by some slight change in its chemical character, it gives the positive direct reaction of Van den Bergh. The remaining moiety of bilirubin is evidently a useful product conserved by the organism and so is not withdrawn from the blood stream by the liver cells and continues circulating. This type of bilirubin A is dissimilar either in concentration or in slight variation of chemistry from the other and gives ordinarily the indirect reaction of Van den Bergh. It is apparently this type of bilirubin that reaches a large measure of concentration in pathologic hemolysis and gives the distinct bilirubinemia of hemolytic jaundice. The amount of bilirubin in hemolytic jaundice available for action upon by the liver cells is greatly in excess of their capacity and there might be a direct injury to the liver cells by reason of the overcharged bilirubin content. The presence of calculi in hemolytic jaundice in non-inflammatory gall-bladders and ducts would suggest that this element of pleichroma was a factor in their production. The removal of the spleen would obviously limit the degree of pathologic hemolysis and the liver would then be able to excrete its normal quantity of bilirubin. The liver has a threshold for the elimination of bilirubin just as has the kidney. In some cases it allows the elimination of bilirubin in the bile much more readily than in others, and in hemolytic jaundice the threshold is exceedingly high with retention and accumulation of bilirubin in the blood stream. The bilirubin that occurs in frank obstructive jaundice or in disease of the liver cells has a renal threshold of 140,000, whereas the bilirubin that occurs after marked hemolysis and meets its best example in hemolytic

jaundice has a much higher threshold of renal elimination and does not appear in the urine as a bilirubinuria. In fact it may be doubted if in hemolytic jaundice, without some added complication, bilirubin ever passes through the kidney at all.

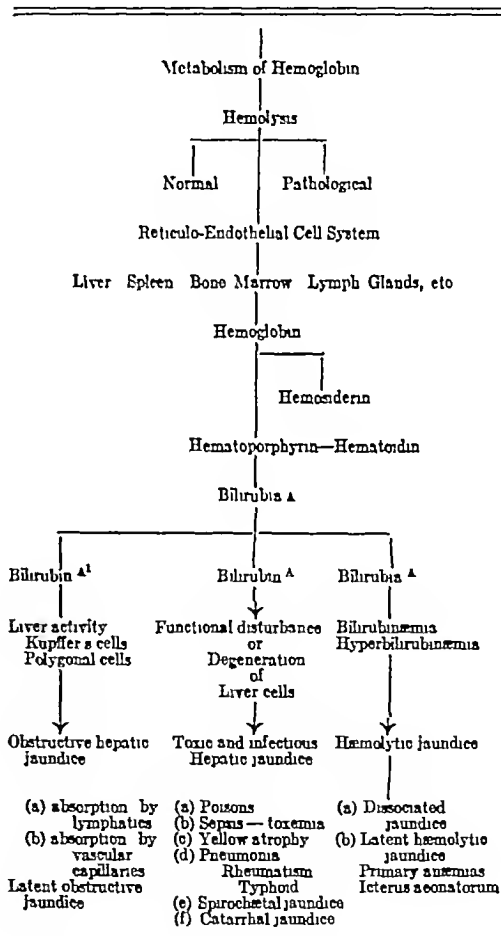

According to McNee we may classify jaundice into three main types (1) obstructive jaundice (2) toxic and infectious hepatic jaundice (3) hemolytic, nonhepatic jaundice (Chart I). Obstructive jaundice presupposes a normal bile formation and a normal mechanism of excretion through apparently normal liver cells. This mechanism does not obtain for any great length of time after obstruction has occurred, for normal bile is no longer secreted nor are the liver cells intact. We may have, however, a jaundice that in the beginning at least is purely obstructive. That the mechanical factor of obstruction does not long obtain is evident for just as soon as the obstruction raises the hydrostatic pressure of the fluid within the ducts to a degree equal to that of the secretory liver pressure there must of necessity be a cessation of flow or even a reversal of direction of the bile current with a functional or intrinsic damage to the liver cells.

A differential diagnosis of jaundice will embrace an analysis of the history, an examination of the gastrointestinal tract, blood, urine, together with a physical examination of the patient, and such additional information as may be given by x-ray studies. Statistical analysis of a large series of cases exhibiting jaundice indicates that according to the frequency jaundice may be classified in the following order—jaundice associated with (1) gall-stones and infection of the extra-hepatic bile ducts (2) catarrhal jaundice—hepatic degeneration (3) cancer of the liver (4) cirrhosis of the liver (5) cancer of the bile ducts or gall-bladder (6) cancer of the pancreas (7) cancer of the stomach. Of outstanding importance is whether the onset of the icterus was associated with pain. So important is the presence or absence of pain with jaundice that most clinicians for ease of diagnostic interpretation speak of "painless jaundice" and "jaundice associated with pain." Pain when it occurs in

patients with jaundice may be of two types

1 Colic—colicky pain comes on suddenly, has a rapid rise to a maximum intensity, is followed by a short free interval from pain, and is so severe as to require anodynes. This type of pain is pre-eminently the type of pain that is associated with calculus, or infectious obstruction of the cystic, hepatic, or common duct.

CHART I—JAUNDICE

2 Distension pain is a dull, heavy, "stretching pain." It is continuous, has none of the colicky or paroxysmal features of the former type of pain, and is associated with the stretching of the capsule of Glisson, from hepatic degeneration, with malignancy or metastatic deposits in the liver. A distended gall-bladder from carcinoma of the head of the pancreas gives the same general type of pain.

gonal liver cells and had subsequently been absorbed because of obstruction. On the other hand, if the sera gave a delayed reaction he assumed that the bilirubin had been formed independently of the liver cells and in addition had not passed through them. If this thesis be correct then there are two kinds of bilirubin that may cause jaundice. That this contention is supported by clinical facts is evidenced by the following (1) Bile from the gall-bladder always gives a typical prompt direct reaction—this bile has obviously passed through the liver, (2) bilirubin obtained from the serous fluids, in hemorrhagic effusions in the chest or abdomen, or knee joints, gives the delayed reaction only, or generally not at all. Such a bile pigment has been elaborated independently of the polygonal cells of the liver.

It is the cells of the reticulo-endothelial cell system, and particularly Kupffer's cells in the liver and the reticular cells of the spleen, which are concerned with the breaking down of hemoglobin into bilirubin. Bile pigment, hemosiderin, and fragments of red corpuscles have been seen repeatedly in both these types of cell, but particularly in Kupffer's cells of the liver. It would seem then that splenic tissue, without and within the liver (Kupffer's cells) and not the liver cells *per se* plays a very prominent part in the formation of bile pigment. On the other hand, not the slightest proof has been brought forward to substantiate the hepatocellular formation of bile pigment. Jaundice may then arise theoretically from the obstruction of the outlet of the bile capillaries after the changed bilirubin has passed through the polygonal cells of the liver or it may occur by reason of the fact that the bilirubin has not passed through the polygonal cells but is absorbed by the vascular capillaries or lymphatics of the liver into the general circulation. The former would be the elimination of an altered bilirubin with bile salts and subsequent absorption from obstruction; the second would be the absorption of an unaltered bile pigment and without bile salts. It is this conception of jaundice that explains the two reactions of Van den Bergh's test. It seems possible therefore to predicate inferentially two different

kinds of bilirubin. While these have not been experimentally or clinically demonstrated, the behavior of bilirubin in varied conditions of jaundice allows this assumption. It would seem that there is a normal content of bilirubin that at all times is circulating in the body. A portion of this bilirubin, which we may call Bilirubin A¹ is taken out by the activity of the liver cells and eliminated in the bile. This bilirubin is possibly of no use to the organism and represents a waste product in the process of excretion, for by its concentration or by some slight change in its chemical character, it gives the positive direct reaction of Van den Bergh. The remaining moiety of bilirubin is evidently a useful product conserved by the organism and so is not withdrawn from the blood stream by the liver cells and continues circulating. This type of bilirubin A is dissimilar either in concentration or in slight variation of chemistry from the other and gives ordinarily the indirect reaction of Van den Bergh. It is apparently this type of bilirubin that reaches a large measure of concentration in pathologic hemolysis and gives the distinct bilirubinemia of hemolytic jaundice. The amount of bilirubin in hemolytic jaundice available for action upon by the liver cells is greatly in excess of their capacity and there might be a direct injury to the liver cells by reason of the overcharged bilirubin content. The presence of calculi in hemolytic jaundice in non-inflammatory gall-bladders and ducts would suggest that this element of pleichroma was a factor in their production. The removal of the spleen would obviously limit the degree of pathologic hemolysis and the liver would then be able to excrete its normal quantity of bilirubin. The liver has a threshold for the elimination of bilirubin just as has the kidney. In some cases it allows the elimination of bilirubin in the bile much more readily than in others, and in hemolytic jaundice the threshold is exceedingly high with retention and accumulation of bilirubin in the blood stream. The bilirubin that occurs in frank obstructive jaundice or in disease of the liver cells has a renal threshold of 140,000, whereas the bilirubin that occurs after marked hemolysis and meets its best example in hemolytic

is delivered into the intestinal tract the bilirubin is converted into hydrobilirubin. The latter, by the activity of intestinal bacteria, is changed into stercobilin and urobilin. The urobilin is in a large measure reabsorbed by the intestinal veins of the portal system and delivered to the liver cells. Some of this urobilin is excreted with the bile so that we have a constant urobilin cycle or an entero-enterohepatic circulation. Under normal conditions no urobilin can be determined in the urine. When urobilin reaches one milligram in 100 cubic centimeters, or 1 100,000, it may be detected in the urine by adequate tests. For a normal entero-hepatic circulation it is necessary to have intact liver cells, for in the presence of normal liver cells the urobilin does not get into the systemic circulation. It is obvious that in the presence of complete obstructive jaundice there can be no reabsorption of urobilin from the intestine and hence urobilin will not appear in the urine. If, however, there is an incomplete obstruction which will permit of the delivery of some bile into the intestinal tract, then the presence of any slight degree of functional disturbance of the liver cells will permit urobilin being delivered into the systemic circulation and its subsequent appearance in the urine. If the liver cells are injured, however, with or without obstruction, there is a delivery of urobilin into the systemic circulation. MacMaster and Rous have drawn attention to minute quantities of urobilin that may be found even in the presence of complete obstruction. The mechanism for this presupposes that in conditions of chronic icterus there is an elimination of bilirubin into the intestinal tract by the systemic circulation, and thus bilirubin is changed to urobilin and is reabsorbed by the portal system, and, in the presence of injury to the liver cells, is delivered into the blood stream and later appears in the urine.

Bauer suggested the galactose tolerance test. When galactose is ingested the liver converts it into glycogen and ultimately into dextrose. The kidney has no threshold for galactose and so long as it is circulating in the blood it will be excreted in the urine. If forty grams of galactose are taken by the patient on an empty stomach, the liver readily metab-

olizes it so that less than one gram and rarely more than three grams will appear in the urine in a five hour period. If liver degeneration is present galactose appears in larger amounts in the blood stream and the finding of more than three grams in the urine in a five hour period would suggest liver degeneration.

In obstructive jaundice there is no inability of the liver to metabolize galactose. In late cases of liver disease with edema and hydrohepatosis, the galactose test will indicate liver disability.

Certain information can be derived from x-ray study. Gastrointestinal examinations should be made to eliminate neoplasm and other gastrointestinal pathology. Cholecystograms fail to render any aid in the presence of jaundice. Much diagnostic information may be derived from a complete physical examination. The loss of weight which occurs in jaundice is rapid, but by and of itself is not of much diagnostic significance because loss of weight is characteristic of all jaundice irrespective as to the etiological factor.

The presence, however, of petechia or the development of purpuric spots along the lines of a lightly applied tourniquet is significant of the hemorrhagic tendency in jaundice. Pruritis may be present. Contrary to opinions expressed in the literature, our own experience has been that chronic jaundice due to neoplasm of the liver is not associated with marked pruritis. The most marked cases of pruritis have been those associated with the obstruction due to calculus in the extrahepatic duct system. The presence or absence of ascites suggesting late portal cirrhosis or metastatic malignancy is readily determined. In the absence of ascites the liver edge may be palpated and significant information may be obtained. Not infrequently, bosselated areas or nodular deformities of the liver may be palpated, significant of metastatic carcinoma of the liver. In approximately eighty per cent of the malignancies of the head of the pancreas, a pear-shaped tumor may be felt in the right upper quadrant. This tumor—a distended gall-bladder—increases in size with the jaundice and is the basis of Courvoisier's law.

Stone in the common duct is prepon-

The onset of jaundice with colicky pain is abrupt, dramatic, sudden and the icterus will appear within twenty-four hours. Jaundice that appears painlessly is insidious, continuous, and ordinarily some neighbor or member of the family informs the patient that he has a yellow color. To recapitulate, the development of a jaundice after a dramatic attack of colicky pain presupposes disease of the external biliary apparatus in which calculus and infection are the etiological factors. A slow creeping jaundice without initiatory pain and one which continues to rise in intensity, with the development of aching type of pain sometime after the onset of jaundice is indicative of either a neoplastic compression of the common duct, or the development of some intrinsic pathology of the liver.

In all infectious conditions of the gall-bladder there is a concomitant infection of the common duct and hepatic ducts, and mechanical obstruction, be it calculous or infectious products, is as a rule intermittent and rarely complete for long periods of time. In a malignancy of the head of the pancreas, or of the common duct, the occlusive process is complete and permanent. In hepatic degenerations, which vary from catarrhal jaundice to acute yellow atrophy, there is no change in the lumen of the extra-hepatic ducts sufficient to cause obstruction and therefore an investigation as to the presence or absence of bile in the gastrointestinal tract is of great diagnostic importance. Two methods of investigation may be carried out: one is the daily examination of the stool for the presence or absence of bile, and the other is duodenal drainage for three successive days. A complete absence of bile from the stools or in the duodenal drainage in patients with continuous jaundice would suggest a malignant obstruction of the external biliary duct system. The intermittent presence of bile in the stools or duodenal drainage would suggest that from time to time bile is delivered into the intestinal tract and therefore would suggest inflammatory disease, with or without calculi, of the external biliary duct system or intrinsic disease of the liver.

Certain data may be obtained from blood chemistry. Of outstanding importance is the periodic determination of the

icteric index. Since the liver is concerned with (1) the excretion of bile pigment—bilirubin, (2) carbohydrate metabolism, and (3) the analysis and synthesis of protein, it follows that examination of the chemistry of the blood can be fruitful in suggesting diagnostic differentiation. The icteric index determines the intensity of jaundice. It is the measure of the intensity of the color of the blood serum as compared with a standard solution of 1/10,000 potassium bichromate. Normally the blood serum has three to six times as intense a color as the standard so that the normal icteric index is from three to six. Clinical evidences of jaundice are usually present when the icteric index reaches seventeen. The interval between the normal index of three to six and the clinical evidence of jaundice from seventeen to twenty, is termed latent jaundice. The icteric index then represents a quantitative estimation of icterus but gives no information as to whether the jaundice is obstructive, toxic or hemolytic. It is in short, a measure of the degree of jaundice. However, in obstructive jaundice, the icteric index rises rapidly and maintains itself in a more or less uniform elevation. The icteric index in malignancy of the head of the pancreas is usually from 150 to 250, while the elevation in hepatic degeneration is continuous and has a tendency to rise above 300. The icteric index may be combined with the Van den Bergh but the determination as to whether the reaction is direct or indirect is not of much diagnostic importance.

The liver receives cholesterol from the blood and excretes it as cholesterol and cholesterol esters in the bile. In obstructive jaundice there is an increase of cholesterol in the blood. The normal amount of cholesterol in the blood is from 160–200 mg per 100 c.c. of blood. In liver disease, *per se*, cholesterol has a normal range. In hemolytic jaundice and in pernicious anemia there is a low cholesterol content, while in obstructive jaundice there is a rise in cholesterol content which in a rough way parallels the rise in the icteric index.

In connection with the consideration of jaundice it is interesting to canvass what has been described as the enterohepatic circulation of bile pigments. When bile

CHAOS IN DRUG THERAPY

A Vicious Circle

CHARLES SOLOMON, M D, Brooklyn
*Assistant Clinical Professor of Medicine, Long Island College of Medicine, Chairman of
Subcommittee on Drugs of the Kings County Medical Society*

In Retrospect

The history of man's efforts to cure his ills by using drugs is rather an appalling thing. It is filled with successive triumphs of bland credulity over sound judgment. Time after time both laymen and physicians have ben stampeded, for some mysterious reason, into believing that an individual drug or drug preparation, or a specific class of drugs, had all the characteristics of a panacea.

This has gone on and on and some of our greatest scientists have yielded at times to the call of credulity. A notable instance is that of Pasteur and the magic panvaccine for all diseases in which he led himself to believe. If we look back into the fairly recent history of therapy we shall be chastened by the number of "successful cures" duly reported after what purported to be sufficient clinical trial, which surely could not have been effected, for instance, as the "cure" of rickets with olive-oil.

Looking back much further we come upon the strange and alarming medical traditions of the Arabians and especially of the Nestorians, the latter being a heretic sect exiled from the Byzantine Empire for its religious beliefs. They produced, however, the best physicians of their time, and actually founded schools for medical investigation and research of a sort. They popularized the medical use of drugs such as rhubarb, senna, and tamarind, and they used sugar as a base for many remedies.

But the ancient Arab system of medication was formidable indeed. The Arabs proper were polypharmacists and argued that a remedy must contain a base, the elements necessary for that base the elements which reinforced the activity of that base, and elements which could replace those that might be impure. By 1610 this elaborate system of drug therapy resulted in such descriptive gyrations as the following:

Opium is the base of this electuary, but you will find here other drugs to augment the action, and as these drugs are of bad quality, others were added to correct this fault. Yet this is not all. They heap up enormous quantity of drugs, which are charged with such virtues as to direct the action of some parts of the medicine to the head, others to the lungs, others to the heart, the stomach, the spleen, the kidneys, and other parts of the body. Thus the refreshing and narcotic virtue of opium is increased by the addition of henbane and mandragora bark, while the undesirable qualities of the latter are corrected by myrrh, euphorbia, and castor. Their action is directed to the head by means of cloves, of peony and sage, of aloe and incense, they penetrate the lungs through the action of sulphur, thyme and adroganli, finally, they are directed to the heart by the addition of pearls, *blatta odoratus*, gold, silver, stag's bones, and ivory.

To say that complexity ruled is to be redundant. The pharmacopeia of the day became a complicated compilation of complex, superstitious remedies with high-sounding names such as the adriatansia with thirty-eight ingredients, the zedoary with thirty-five, and the esdrae with forty-three—including rue, parsley, hyssop, calamus, gentian, alder, storax, horehound, cassia, and many others. The reaction came when Bernard and Provincial sought simplification in pharmacy to release the ill from bondage of the omnipotent apothecary. Such reactions towards drug nihilism have occurred again and again because physicians have again and again been too eager to believe in the powerful virtue of drug remedies and to increase their complexity. Sir William Osler referred to the complexity of our modern pharmacopeias as "the heavy hand of the Arabian."

In 1933 Sir Andrew MacPhail wrote,¹ in part as follows:

For a perfect sight of the old medicine let me conduct you to the bedside of Charles

derantly the result of a previous infection of the gall-bladder and predicates a chronic cholecystitis with cicatrization and contracture. In 187 cases of obstruction of the common duct reported by Courvoisier (from the literature), obstruction was due in one hundred to causes other than stone and in eighty-seven the obstruction was due to calculous impaction. Of the 100 cases in which obstruction was due to causes other than stone, in ninety-two there was a dilatation or distention of the gall-bladder and in eight cases there was a normal gall-bladder or an atrophy of the gall-bladder. Of the eighty-seven cases in which obstruction was due to stone, in seventy cases the gall-bladder was atrophied and in seventeen cases the gall-bladder was dilated. Courvoisier then enunciated his law

In cases of chronic jaundice due to blocking of the common duct, a contraction of the gall-bladder signifies that the obstruction is due to stone, a dilatation of the gall-bladder that the obstruction is due to causes other than stone.

In reporting the cases of the Massachusetts General Hospital, Cabot found eighty-six cases of obstruction of the common duct. Fifty-seven were due to calculous obstruction, in forty-seven the gall-bladder was atrophied, normal in eight, enlarged in two. Twenty-nine cases of obstruction were due to causes other than stone, in twenty-seven the gall-bladder was distended, in one the gall-bladder was empty, and one contracted around calculi. Four cases only of this series were exceptions to Courvoisier's law. With the exception of these four cases, which constituted only five per cent of the total number examined, every record of the Massachusetts General Hospital series in which definite statements are to be found con-

cerning the points at issue goes to confirm Courvoisier's law.

In eighty-four per cent of cases with stone in the common duct we find a contracted gall-bladder. Therefore, a case of obstructive jaundice with (1) history of colic, (2) distinct variations in the intensity of the jaundice (remittent or intermittent)—"ebbs and flows", (3) absence of distention of the gall-bladder, (4) presence of septic reaction—chill, fever, sweat, leukocytosis, (5) continuous or occasional presence of bile in the feces, (6) chronicity—then the diagnosis is almost positively calculous or inflammatory cholangitis.

Summary

Jaundice plus pain plus bile in the stool or duodenal drainage, denotes calculous or infectious obstruction of the external biliary system. Jaundice without pain, and without bile in the stools or duodenal contents indicates carcinoma of the external biliary system. Jaundice without pain, with bile in the stool or duodenal drainage suggests intrinsic pathology of the liver. Hemolytic jaundice, familial jaundice, the jaundice of the anemias, are termed "dissociated jaundice" in that there is an excess of bilirubin in the blood but no retention of bile salts or bile acids and the excretory function of the liver for the delivery of bile into the intestinal tract is normal. Gall-stones, however, may be found at laparotomy in patients with hemolytic jaundice because there is "bile retention" in the intrahepatic bile ducts due to the excess of bile pigments, with an inability of the liver to excrete this excess. Bile thrombi occur in the intrahepatic bile canaliculi and there is a deposition of bile pigments in the gall-bladder with the production of pleiochromic calculi.

The New York State Conference of State, County and City Committees on Tuberculosis and Public Health of the State Charities Aid Association, will be held at the Hotel Roosevelt, New York City, on May 11, 12, and 13. Authorities on tuber-

culosis, syphilis control, and allied problems of public health will take part in the program, together with representatives of the sixty-two County and City organizations affiliated with the State Committee and the National Tuberculosis Association.

CHAOS IN DRUG THERAPY

A Vicious Circle

CHARLES SOLOMON, M D, Brooklyn
Assistant Clinical Professor of Medicine, Long Island College of Medicine, Chairman of
Subcommittee on Drugs of the Kings County Medical Society

In Retrospect

The history of man's efforts to cure his ills by using drugs is rather an appalling thing. It is filled with successive triumphs of bland credulity over sound judgment. Time after time both laymen and physicians have been stampeded, for some mysterious reason, into believing that an individual drug or drug preparation, or a specific class of drugs, had all the characteristics of a panacea.

This has gone on and on and some of our greatest scientists have yielded at times to the call of credulity. A notable instance is that of Pasteur and the magic panvaccine for all diseases in which he led himself to believe. If we look back into the fairly recent history of therapy we shall be chastened by the number of "successful cures" duly reported after what purported to be sufficient clinical trial, which surely could not have been effected, for instance, as the "cure" of rickets with olive-oil.

Looking back much further we come upon the strange and alarming medical traditions of the Arabians and especially of the Nestorians, the latter being a heretic sect exiled from the Byzantine Empire for its religious beliefs. They produced, however, the best physicians of their time, and actually founded schools for medical investigation and research of a sort. They popularized the medical use of drugs such as rhubarb, senna, and tamarind, and they used sugar as a base for many remedies.

But the ancient Arab system of medication was formidable indeed. The Arabs proper were polypharmacists and argued that a remedy must contain a base, the elements necessary for that base the elements which reinforced the activity of that base, and elements which could replace those that might be impure. By 1610 this elaborate system of drug therapy resulted in such descriptive gyrations as the following:

Opium is the base of this electuary, but you will find here other drugs to augment the action, and as these drugs are of bad quality, others were added to correct this fault. Yet this is not all. They heap up enormous quantity of drugs, which are charged with such virtues as to direct the action of some parts of the medicine to the head, others to the lungs, others to the heart, the stomach, the spleen, the kidneys, and other parts of the body. Thus the refreshing and narcotic virtue of opium is increased by the addition of henbane and mandragora bark, while the undesirable qualities of the latter are corrected by myrrh, euphorbia, and castor. Their action is directed to the head by means of cloves, of peony and sage, of aloe and incense, they penetrate the lungs through the action of sulphur, thyme and adroganli, finally, they are directed to the heart by the addition of pearls, *blatta odoratus*, gold, silver, stag's bones, and ivory.

To say that complexity ruled is to be redundant. The pharmacopeia of the day became a complicated compilation of complex, superstitious remedies with high-sounding names such as the adrianum with its thirty-eight ingredients, the atansia with thirty-five, and the esdrae with forty-three—including rue, parsley, zedoary, pennyroyal, wormwood, thyme, hyssop, calamus, gentian, alder, storax, horehound, cassia, and many others. The reaction came when Bernard and Provincial sought simplification in pharmacy to release the ill from bondage of the omnipotent apothecary. Such reactions towards drug nihilism have occurred again and again because physicians have again and again been too eager to believe in the powerful virtue of drug remedies and to increase their complexity. Sir William Osler referred to the complexity of our modern pharmacopeias as "the heavy hand of the Arabian".

In 1933 Sir Andrew MacPhail wrote,¹ in part as follows:

For a perfect sight of the old medicine let me conduct you to the bedside of Charles

II With a cry he fell Dr King who, unfortunately, happened to be present, bled him with a pocket-knife. Fourteen physicians were quickly in attendance. They bled him more thoroughly, they scarified and cupped him, they shaved and blistered his head, they gave him an emetic, a clyster, and two pills. During the next eight days they "threw in" fifty-seven separate drugs, and, towards the end, a cordial containing forty more. This availing nothing, they tried Goa stone, which was a calculus obtained from a species of Indian goat, and, as a final remedy, the distillate of human skull. In the case report it is recorded that the emetic and the purge worked so mightily well it was a wonder the patient died. One physician did protest that they would kill the king, and out of this arose the suspicion that he had been irregularly poisoned. But he did die, "as peaceable as a lamb", his last words were, "Do not let poor Nellie starve"

Drug therapy went through many changes before it reached the shotgun prescriptions of later days, which were followed by irrational tendencies towards drug nihilism and by the equally unscientific higher homeopathy. In 1860 Dr Oliver Wendell Holmes declared, in an address before the Massachusetts Medical Society, that *in view of the prevailing dependence of the medical profession upon medication*. "If the whole *materia medica, as now used* (italics mine), could be sunk to the bottom of the sea, it would be all the better for mankind—and all the worse for the fishes"

Yet the trend to simplicity did not last. Dr Willard C Stoner wrote² in 1929

Incident to the opening of the new St Luke's Hospital in Cleveland, in December 1927, I became interested in this problem, and, while nothing definite has been done to simplify drug therapy in the hospital, *as taken from our drug books as bromidia and unds* I have _____ drugs and 200 were

Experiences in the World War represent a striking example of the chaos of drug therapy, where medical men were brought together in practice in great numbers, such as peace-time does not afford. As staff consultant at a base hospital in France, I was brought into intimate contact with a large group of medical men whose training and ideas of therapy were considerably at variance. We were able to demonstrate that the acutely ill can be managed rather satisfactorily with little or no medication aside from cathartics during a period when we were without a supply of drugs in managing a thousand soldiers whose illnesses were largely acute diseases, such as influenza and respiratory infections.

Though the mortality was very high at this time, Dr Stoner evidently means that a more complete supply of drug preparations would have done little or nothing to reduce it.

Modern therapeutic fads, for they cannot otherwise be accurately described, stampede doctors, however, into belief in the special efficacy and incredible healing virtue of this or that drug, or class of drugs, *by turn*. We speak of the ignorance and credulity of laymen yet we ourselves tend to become addicted to soured milks, ultraviolet rays, glandular therapy, urinary and intestinal antiseptics, internal baths, vaccines, serums, and injection treatments, one after the other. *It is time that we stopped to ask ourselves How did this profusion of drug preparations, so many of them being proprietaries, come into existence and how many of these all but numberless preparations are absolutely necessary in sound therapy?*

Impact of Modern Commercialism

The rise of the modern industrial system with its adjunct and business-maker, advertising, gave enormous impetus to the drug business. Whereas rather harmless little individual healing fads had always existed there was now on hand the machinery to transmute these fads into big business. An enormous mechanism now existed to facilitate the dissemination of propaganda.

In its *World Trade Notes* issued in the fall of 1932 the United States Bureau of Foreign and Domestic Commerce reported that proprietary medicines did a

business of \$172,648,000 in 1931, though operations were then eighteen per cent below those of the peak year of 1929. However, the figure was very close to that recorded as the average for the years 1921 to 1929 in the biennial census, \$172,798,000.

Proprietary medical specialties dispensed by physicians' prescriptions made an advance in money value of thirty-two per cent over their average for the years 1921 to 1929, the figure for 1931 being \$52,598,000. On the average a much larger proportion of the proprietary production in 1931 was of "ethical specialties" than in the previous decade. The production of proprietary medicines for the general public was twenty-two per cent less in 1931 than in 1929 and amounted to \$120,050,000.

What sort of medicines were the ethical preparations? The report informs us that for the fourth successive biennial census year, vitamin and glandular preparations had greatly increased in numbers, indicating a trend towards new fashions in healing. Ethical synthetic medical preparations also made a great gain, and more ethical specialties containing narcotic drugs were manufactured than in any year since the World War, though there was a fortunate decrease in narcotic-containing proprietaries sold directly to the general public.

These figures include the output of establishments primarily engaged in the manufacture of patent or proprietary medicines as well as of those engaged in other lines. They cover the medicines sold under the protection of patents, copyrights, or trademarks, or prepared according to secret formulas. Both medicines sold for self-medication and those prescribed by physicians are included.

We have a picture, then, of big business methods geared to the science and art of drug manufacture and therapy. The rise of the profit system was a natural phenomenon in the economic world, but the suspicion arises at times that it might well have been restricted from entering certain fields. The evidence seems increasingly to indicate that the sale of drugs and drug preparations which are used in what may be, for want of a better name, called scientific therapy,

should either operate on a nonprofit, non-competitive basis, or else State price regulation should rule it.

For instance, here is Chauncey D. Leake, Ph.D., discussing "The Pharmacologic Evaluation of New Drugs." He writes:

Intense and undignified commercial rivalry, as well as great interest in synthetic organic chemistry, is continually forcing the clinical use in diagnosis, therapy, or prophylaxis of new substances without a reliable scientific background. Seriously compromising the growth of rational medical practice, such procedures may induce another wave of "therapeutic nihilism." These commercial efforts, however, are too often successful through the operation of rather obvious means: (a) the relative inactivity, and therefore nontoxic effect of various materials, (b) the undetermined *vis medicatrix naturae*, (c) the credulity of too many physicians.

It begins to appear that, while irrational drug therapy might have been a rather sporadic and localized infection under conditions existing fifty years or more ago, when geared to big business methods it becomes pandemic. Leake goes on to say that *very few medicinals today come to clinical trial with proper preliminary study. Commercial methods and national advertising demand that markets be sought quickly whether the remedy is sufficiently tested scientifically or not.* He continues:

It is pathetically unbelievable that many American physicians not only seem unfamiliar with the general program of the Council (A.M.A.), but even seem apathetic towards its efforts in their behalf. Too few use *New and Nonofficial Remedies* as a guide in dispensing. Indeed, too few seem to consult the *Pharmacopoeia*. What is worse, preparations are constantly becoming official which have no scientific justification in medicine—the greatest offense being the admission of substances slightly modified chemically from some well-recognized and official agent, without satisfactory evidence that such modification has improved the therapeutic index (ratio of efficiency to toxicity). The exploitation of these unessential modifications at outrageous prices smacks of silvering a penny to pass for a dime.

The picture emerges of what happens when modern commercialism methods are applied to the manufacture and sale of

drug preparations for profit in a strictly competitive economic system. Yet pharmacy should be a profession at least quite as dignified and quite as removed from the direct channels of profit competition as is the practice of medicine at its best. To demonstrate that this is not a mere whim or bias of the author a little more evidence may not go amiss.

Exploitation of Proprietaries

W. A. Puckner, Ph.D., and Paul Nicholas Leech, Ph.D., writing on "The Introduction of New Drugs"⁴ adumbrated the vicious circle to which the present author wishes to call more direct attention. In the old days, say these authors, commercial firms searched the therapeutic indexes of dispensaries for drugs said to be "indicated" for certain conditions, combined a number of them in a shotgun remedy, saying (as we saw the Arabians did)—"Each component might add to the beneficent action of the other"—thought up a catchy name, and were ready for business.

A great deal of that sort of thing went on in earlier days. Unfortunately it still goes on! Obliging physicians also, then as now, presented firms with ready-made combinations which were said to have worked magic in rheumatism, gonorrhea, asthma, syphilis, or other diseases. Liberal advertising was invoked, medical journals receiving large slices of the advertising appropriation which protected the firm against unfavorable comment on the product by those who might send in papers declaring it inefficacious.

Today the same sort of thing goes on more subtly, as Puckner and Leech show. "In the case of a number of these products the investigators do not know with what they are working because the manufacturer himself does not know what he has. In the hurry of pharmaceutical dealers to be of service to the profession, products of various degrees of composition and activity are being rushed on the market." Possibly the most popular type of proprietary of the day is evolved by adding together two well-known drugs in fixed proportions, heating them till they melt, and presenting the resultant mechanical mixture as a new substance.

A hypnotic and an analgesic make a familiar combination. Yet why combine them at all? Puckner and Leech continue.

To the chemist, it would appear more scientific to prescribe the hypnotic and analgesic in the respective doses indicated, rather than to accept the manufacturer's statement that the preparations are definite chemical compounds, which they are not. Even if they were compounds, the criticism would be just as apropos, because in the digestive tract they would break up into the original two compounds.

The pharmacist is compelled to load his shelves with numerous preparations of dubious value, or with a wide variety of preparations of about equal quality and the same therapeutic intent. No wonder Ernest T. Taborelli, Ph.D., referred to the proprietary or patent medicine as Public Enemy No. 1 in a letter to *Practice Druggist* (July 1933). He denounced the so-called "brand-curse" wholeheartedly, though he admitted that druggists had backed up manufacturers in making customers believe that particular brands of milk of magnesia, epsom salts, or sodium bicarbonate were unequivocally the best.

Advertising serves the same end both for general and for ethical proprietaries. Davis and Sharpe, discussing urinary antiseptics,⁵ brought this out with fine indignation. Their article had a section carrying the caption "Commercialism in the Drug Trade" in which they discoursed on the discrepancies between advertising claims and clinical results. Some of this material deserves quotation in support of the present author's thesis.

Big business, geared to overproduction and handicapped by competition and by the high cost of maintaining elaborate organization, is dependent for its very existence on efficient, nation-wide distribution and sales volume. Hence the necessity for high pressure salesmanship and extensive advertising programs, and the reason for advertising claims which tend to become both extravagant and fanciful, and which may be not only untrue, but obviously so. Any one who reads modern newspapers and magazines is familiar with the type of fanciful advertising claims which lead the reader to wonder whether the advertiser is mentally unbalanced, or whether he (the advertiser) thinks that the public is mentally unbalanced.

The purpose of this comment, however, is to direct attention to the fact that this tendency is making itself evident in the legitimate drug trade, where it is not so humorous as, for instance, in the cigaret trade. *Full-page advertisements in ten colors on heavy paper in leading medical journals do not establish the clinical value of any given pharmaceutical agent* (Italics mine) Nor is therapeutic efficiency increased by fancy wrappings. A drug either has properties whereby it accomplishes (in a certain measure) the purpose for which it is recommended, or it has not. Regardless of the display of scientific investigation made by the various drug corporations, the truth remains that the chief interest of the drug trade lies in manufacturing and distribution, and that research, at best, is to be regarded merely as a means to an end.

How, then, should the physician be guided? Should he gain his postgraduate training from samples, booklets, blotters, testimonials, detail men, colored advertisements, published clinical impressions, or by the results of carefully controlled laboratory investigation? Can he secure guidance of the last-named sort even if he wants it? Is the physician safe today, even if he seeks to follow recognized authorities and to restrict himself to the use of official preparations? Not always, we shall see, when so many inferior preparations somehow manage to crawl in among the best official society.

At one time it might have been said truly that rapid diffusion of knowledge about the effectiveness of a drug could be accepted as a criterion of its definite utility. This is so no longer, as Dr V. E. Henderson has brought out.

As a result of laboratory studies Macht of Johns Hopkins was led to recommend the use of benzyl benzoate for the relief of spasm in smooth muscle. Yet examination of his original data reveals that the concentrations he used on experimental animals were far in excess of those recommended for patients. There was never very strong clinical evidence for the drug's value. But "owing to the active propaganda of pharmaceutical houses, most physicians have employed it." Yet the drug had little if any therapeutic value, hence the physician should be slow to take advertising evidence as proof of clinical merit.

"A new drug which is passing through the stage of having a market built up

for it by advertising (italics mine) seems to possess more therapeutic merit, and yet the advertising often seems to outrun the therapeutic claims made by its discoverer." Such was the case with hexylresorcinol (Caprokol), according to Henderson. Vedder Leonard, who introduced the drug in 1924, made very modest claims for it. But manufacturers and advertisers widely advised its use for unselected cases of urinary tract infection in most of which it could have little if any usefulness.

Results of Propaganda

The impact of modern business methods upon drug therapy has obviously been unfortunate. Man has sufficient faith in the impossible as things are. His tendency to imagine that he has secured definitely planned results by the use of irrational methods is active enough in any case. When, however, his credulity is played upon by subtle advertising psychology, and when the drug industry is so organized that ruthless profit competition occurs, the results are disastrous not only to medical therapy but to pharmacy, to nursing, and to the teaching of pharmacology and related sciences.

Writing in 1930,⁷ Dean Ernest E. Irons of Rush Medical College advised the Congress on Medical Education and Hospitals to cut the costs of hospitalization by using standard drugs instead of proprietaries, saying "The shelves of some hospital pharmacies remind one of the exhibits of proprietary medicines in a chain-drug-soda-fountain-lunch-room." Patients continue the use of proprietary drugs, buying by name, long after they leave the hospital and Irons cites the case of serious injury as a result. Most trademarked brands, he said, simply comply with U. S. P. standards and are not better, they are only costlier. The existence of so many brands of the same drug causes stock duplication and ties up several times as much money in pharmaceuticals as is really necessary.

Another angle is supplied by the *International Medical Digest* of March 1930 in an article deploring the decline of the art of prescribing. "Few there are who come in contact daily with interns in our recognized hospitals who will not admit that these young men are altogether in-

capable of writing a satisfactory prescription for a patient." Patients expect excess medication, if anything. Doctors have either gone fanatic in drug skepticism or else follow manufacturers' statements too slavishly. Study of *materia medica* and official preparations is neglected, according to this authority.

Similar views were expressed by Dr Charles W. Edmunds, speaking on "Pharmacology and the Medical Schools" in 1930.⁸ Pharmacology, said Edmunds, is taught in most medical schools combined with physiology, biological chemistry, or biochemistry, the professor represents the extra burden, does a poor job, and research is sterile in about a third of the schools. In many schools the teaching is itself most unsatisfactory and graduates tend rather to rely upon proprietary remedies or else to be therapeutic nihilists.

Other students, however, like their professors alas, "are very prone to use any drug, serums, or concoction or mixture that a pharmaceutical house puts out." Manufacturers, in turn, continually send physicians letters suggesting that they refer their medical problems to the manufacturer's medical staff, and too many doctors yield to the suggestion. The doctor selects remedies from the flood of medical advertising literature—most of it entirely outside the scope of the American Medical Association Council—and thus "takes his graduate training in therapeutics."

Chaos in drug therapy builds upon the carelessness, the incompetence, and the overwork of physicians who will not or cannot take time to investigate thoroughly. This is not said to be harsh nor sensational, it is a matter-of-fact statement of self-evident truth. Consider, if you will, the wide variety of prescriptions on file in pharmacies that have been written for the amelioration of a condition like pneumonia, influenza, or the common cold. It almost seems as if no two doctors would apply the same drug therapy or can induce themselves to believe in the value of the same preparation from the same manufacturer.

How Doctors Are Misled

What taught them that? Certainly

not the science of pharmacology. It must then have been manufacturers' propaganda of one sort or another. Of these prescriptions the vast majority are for some stock proprietary. If, however, the prescription is individualized it is all too often written incorrectly, as a careful reading of drug and pharmaceutical journals, where druggists air their complaints against ignorance of physicians in prescribing, will disclose.

This same ignorance is disclosed quite as shockingly by the persistent use, or by the abuse, of useless or misapplied drugs. A writer⁹ in 1932 called attention to the fact that sarsaparilla was not rejected by the British *Pharmacopoeia* until 1914, though it had been known to be valueless a hundred years before. In 1870 Great Britain spent \$250,000 on this useless drug, sufficient to maintain, build, and equip a fair-sized therapeutic institute!

One might write an entire treatise on the abuse of ergot in its multifarious preparations. For a long time the alkaloids ergotoxine and ergotamine were supposed to account for the full oxytocic activity of ergot preparations. It was only in 1932 that Moir produced evidence to show that crude extracts of ergot were more powerful than either alkaloid, hence a new and unidentified principle was the main source of activity of this much abused and misapplied drug. Finally this substance was purified and could be studied scientifically.

Yet for years American physicians used aqueous extracts of ergot which had no potency, or other extracts which rapidly lost their activity. For it was only four or five years ago that Marvin R. Thompson, then of the Food and Drug Administration, did the first fundamental work on the preparation and keeping quality of ergot fluid extracts. But the abuse of the drug continues on the part of physicians who have an unwarranted faith in it.

Mere paucity of authentic scientific knowledge does little to discourage the competitive manufacturer in his struggle for profit. As Dr Maurice E. Shaw wrote in 1936:¹⁰

We often marvel at the credulity of our patients, but the truth is that we are almost unbelievably credulous ourselves. This

weakness is quite naturally exploited by manufacturers of drugs and therapeutic products who have enough acquaintance with psychology to know that we shall be impressed by the presentation of a remedy in pseudo-scientific language.

Dr Shaw continues that advertisements assure doctors that the ultimate proof rests in clinical trial. Pharmacology texts are replete with the accounts of the action of drugs upon experimental animals, in dosages never used on human beings! "There follows a spate of testimonials from doctors of varying degrees of eminence (judging from their academic qualifications) all joining in a monotonous pean of praise based, as a rule, upon a single case in which the remedy has been tried." Failures are not mentioned—and so the game goes merrily on.

If science is asked, for instance, "Is there recognized any drug which, if taken by mouth, constitutes an intestinal antiseptic?" the answer is an unqualified "No." Nothing is known which will kill all the micro-organisms in the living intestine. But there are plenty of so-called intestinal antiseptics advertised and on the market. *Shall the doctor believe science or advertising?*

If science is asked a similar question about urinary antiseptics the answer is "A study of the literature shows that the reputation of most urinary antiseptics is founded upon a rather empirical use or upon unsound scientific principles." The ideal antiseptics of this sort must be rapidly absorbed and excreted and must have absolutely no irritant action on the intestinal or urinary tract, the liver or the kidneys. There just is no such drug. But the market is full of widely advertised urinary antiseptics which sell on the *post hoc, ergo propter hoc* fallacy.

Davis and Sharpe⁵ tell about eight physicians who met and commented upon the rascality and advertising hyperbole involved in the manufacture and sale of urinary antiseptics. Yet nearly every doctor felt complete confidence in some one such preparation or drug, though there were also representatives of the opinion that none of them should be trusted. The mere drinking of water, and plenty of it, seemed to constitute the best urinary "antiseptic" available, according to them.

A summary statement seems in order here and it is taken bodily from Henderson's address on "New Drugs, Their Use and Abuse," to which reference has already been made.⁶

These few examples illustrate sufficiently clearly certain points in regard to drugs: (1) That a remedy definitely curative with specific indications will become very rapidly known to all reading physicians. (2) That where there are definite indications for a drug, e.g., novasurol in severe edema, success may be attained in its use if employed wisely and with caution and a realization of its limitations and dangers, even if its mode of action is not known. (3) That certain highly specific drugs will be useful to the specialist or even to the practitioner who makes a careful study of the drugs themselves. (4) That the vast majority of drugs recommended by advertisement are of little or no value and that a physician employing thoughtfully and accurately the drugs of the *Pharmacopeia* can do more for his patients than by listening to the specious pleadings of the detail man who should be instantly dismissed by any physician, who is trying to serve his patient, with the same abruptness as that with which Eve should have dismissed the serpent. (5) That at times there are drugs of relatively low efficiency which long experience will show to be of value, e.g., carbromal or argyrol, but that our knowledge of their value can only be built up by the physician's careful study of them, and the cases in which they are useful, and recording the same for the benefit of others, and further, that unless he is willing to undertake such study he had better wait for others to do so. (6) That no physician should recommend drugs to patients by name and so encourage their use by lay patients so as to lead to their abuse by the public and an increase in unattended sickness.

A Vicious Circle

What results? A vicious circle. In late 1932 plans began to be made for the forthcoming *Pharmacopeia* recently issued. The aid of physicians was asked. What should the final list of products be? More than 10,000 prescriptions were studied. It was discovered, for instance, that calcium glycerophosphate had been used in seven of them, indicating that some physicians still did not know that claims for its "tonic" effect were unfounded.

However, elaterium was used only once, indicating that other purgatives had become more fashionable. Guaiacol carbonate appeared about twenty-nine times, yet there is *no evidence that it represents guaiacol*. Jalap was passing out as was also the old idol of the eclectics, lobelia, which appeared but eleven times. The use of croton oil was in decline. Many drugs and compounds could be deleted but as many new ones had appeared. The errors of today were to be discarded to make room for the "truths" that will be recognized as errors tomorrow. So fashions in drugs change and, more important, *their apparent therapeutic power changes with the fashions*.

Cumulative evidence has now been presented in sufficient abundance vividly to portray an existing condition that is more than unfortunate. It is an actual menace to drug therapy. Not only is the use of drugs chaotic, but the condition portrayed resolves itself into a vicious circle which operates to perpetuate and to exacerbate the evil. Here the doctor has a definite responsibility that he must meet before it is too late.

Doctors are favorably impressed with commercial propaganda far too easily for their own and for their patients' good. They are convinced by the sales talk of detail men and by the stuff they read in beautiful advertising monographs and circulars. They fall into the use of proprietaries and, since these doctors are in any case—whether officially or not—teachers of the less experienced, the proprietaries they use become more familiar to their nurses and their junior associates than official preparations.

The chaotic prescribing of proprietaries is especially disastrous in hospital practice for this reason. The repercussions are endless. Other doctors of the future, nurses, and laymen as well, all become maleducated. Meanwhile the study of materia medica becomes increasingly difficult, for no mention is made in serious textbooks of these multifarious fly-by-night products of commerce. The student nurse or the medical student is at a loss to correlate the scientific use of drugs as expounded in the classroom and in the texts with the constant administration of proprietaries in the clinics and wards of the hospital and in general practice.

Nurses are often far better acquainted with proprietary preparations than with the standard materia medica. The careless use of trade names by doctors fixes in young, formative minds words like urotropin, pyramidon, atophan, luminal, and veronal, while the official names—methenamine, aminopyrine, cinchophen, phenobarbital, and barbital—are neglected or forgotten. Meanwhile the promiscuous use of proprietary preparations defeats the purposes of medicine in so far as these are truly scientific. For many of these preparations are of secret composition, while many others are pharmaceutical shotguns, forms of medication all serious teachers of materia medica seek to dis courage.

Surveys have frequently shown that at times almost forty per cent of all drugs prescribed in certain hospitals are not mentioned in any standard textbooks of materia medica. Naturally even the teachers themselves soon begin to feel that the texts are inadequate for pupil needs. The authors of the texts, on the other hand, feel that such criticism is wholly unjust because the class of preparations sold as proprietaries has no proper place in scientific therapy. In any case it would take a thousand-page book of loose-leaf character, to facilitate constant, almost daily, revision with numberless supplements, to treat the proprietaries as they pop up hourly and demand attention. Such a book would then be a mere catalogue and would lose all influence as a proper instrument of class instruction.

All doctors, especially those on hospital staffs, should regard themselves as teachers and should take this obligation seriously. Student nurses and medical students should be taught in the best possible way, not confused and maleducated, and not misguided by the irrational and unscientific use of proprietaries by their mentors. As Cushny said¹¹

For as long as he (the medical student) has to learn the supposed virtues of a host of obscure substances, he will tend to use them in practice, even if only tentatively. This in turn necessitates their inclusion in the pharmacopeias, which again gives them some standing and perpetuates them as subjects of teaching and examination. If examiners would break this vicious circle, they would render the subject of pharmacology more attractive to him. There is

no question that the insistence on numberless preparations of drugs of questionable value has discouraged interest in therapeutics

The thought can be carried further, and it applies with great force to the instruction of both nurse and medical students. Since the *United States Pharmacopeia* and the *National Formulary* include many preparations of questionable value and usefulness, the authors of textbooks feel that these must be mentioned and described. Teachers, finding these descriptions in respectable and authoritative texts, naturally lecture upon them. The students then consider these drugs demonstrably useful. Did not the teacher mention them with evident respect? As they graduate they go forth in turn to prescribe these preparations which, again in turn, gives them such standing that they must be mentioned and their standard preparations described in the *United States Pharmacopeia* and the *National Formulary*.

Some State examiners, like those of New York, still confine themselves heroically to the important preparations in the State Board examinations for nurses and doctors. Due credit must be given them, for they face a very considerable impetus toward less scientific procedure, and how long will it be before they give way? Physicians must bestir themselves about this matter and realize its urgent importance if conditions are to be bettered.

What Is the Remedy?

Other auxiliary remedies suggest themselves. While the competitive profit system arose naturally in this country as in many others, and while the author has no brief whatever against it *per se*, it does seem that we might find some guidance in the procedure of certain other capitalistic countries which remove such social necessities from competitive commerce. Without directly aping the procedure of any one of these countries it is rather easy to formulate a hypothetical system that it might be advantageous to adopt.

For instance, there might be truly professional and scientific apothecary shops or pharmacies as distinguished from what we may call drug stores, which latter could still sell common remedies,

safe for self-medication, and related products for profit in the usual manner. The professional pharmacies might be located by the State or Federal governments where they were needed in view of geographic and population considerations. Apothecaries might be guaranteed a fixed income, it being considered that they rendered a valuable social service if they operated in communities financially unable wholly to sustain them.

The manufacture and sale of drugs and drug preparations might conceivably be under some such government regulation as is the manufacture and sale of veterinary vaccines and serums in this country today. A truly scientific board, composed of physicians, pharmacists, and related professional men, might pass upon the formulas and conditions of manufacture of all drugs and drug preparations to be used in ethical practice. All such medicaments would be sold nonsecretly, as exactly what they were, on a basis of composition, and under their official names, fixed margins of profit being permitted at each stage of the process—to the manufacturer, the wholesaler or distributor, and to the ultimate apothecary dispenser.

In other words, ethical drug remedies would be removed from the sphere of active profit competition, but would be sold on a state-regulated cost-plus plan under the most scientific supervision that could be provided. Duplication, the advertising and sale of superfluous special brands, the production of useless or irrational preparations, the use of fantastic trade names, and the prescribing of secret mixtures could all thus be controlled adequately. On the other hand, it is almost too much to ask that a group of competitive manufacturers clean house voluntarily, for each fears that the other will put something over.

These ideas may, however, be regarded rather as suggestions than as a complete program the adoption of which is advocated by the author. The chaotic use of proprietaries and the vicious circle which operates to bring unworthy compounds into respectable standing does, however, offer a serious problem. Present conditions are a disgrace to physicians, pharmacy and drug manufacturing are degraded, and student nurses and medical

students are confused That patients suffer goes without saying What is worse we harm not only this generation, but we do untold potential harm to future generations We must realize the real seriousness of this problem and we must proceed to apply a remedy

It is the professional duty of the teachers of therapeutics and materia medica in the seventy-eight recognized class A medical schools of the United States to solve this problem They must break the vicious circle For, if but seventy-eight teachers were alert, courageous, and resolute, the circle could be broken forever At very least the next generation of physicians would be equipped to cope intelli-

gently with the proprietary evil For they would receive scientific training in clinical therapeutics and in prescription writing, not mere experimental and theoretical training They would know how properly to evaluate drugs They would not be misled by tradenames nor seduced by fancy advertising Aided by the teachers of materia medica in nurses' training schools, the professor of therapeutics in the medical schools proper could dislodge forever the "heavy hand of the Arabian," and render drug therapy a true science instead of the mere adjunct to commercial propaganda it fast tends to become

TRACKING DOWN FRAUD IS A HARD JOB

The new Special Committee on Illegal Practice of Medicine of the Medical Society of the County of New York has a hard job before it. Created to protect public and profession against illicit healing practices, it will have to pursue its enormous task against heavy odds, remarks the *New York Medical Week*. As the Secretary of the Committee has pointed out, unlawful medical acts are always associated with fraud and deceit, and their perpetrators will not hesitate to employ the same means to continue in business.

These prospects do not daunt the Committee. With the cooperation of the profession it hopes to drive out a good portion of the illegal practitioners who are victimizing the people's health and purse.

The Committee has enumerated twelve flagrant forms of outlaw practice which should be curbed. These are

- 1 Diagnosis, treatment, prescribing and dispensing by druggists and their clerks
- 2 The illegal practice of medicine by chiropractors, chiroprodists and podiatrists
- 3 The illegal practice of medicine by foreign groups, such as "Chinese healers," Polish barbers, etc.

- 4 The practice of dermatology in beauty parlors
- 5 The practice of physiotherapy in bathing establishments without medical supervision.
- 6 The diagnosis of disease by physiotherapists
- 7 Corporate medicine as practiced by utility groups and department stores
- 8 The treatment of diseases of the eye by opticians
- 9 Prescribing and diagnosing by psychologists and lay psychoanalysts
- 10 Diagnosis and treatment by naturopaths and food faddists
- 11 The practice of medicine by reducing groups and clinics
- 12 The performance of eye examinations by motor vehicle inspectors

An important preliminary to actual warfare against illegal practitioners is the accumulation of detailed data concerning them. Any physician who encounters unlawful medical activity, whether it be over-the-counter prescribing by druggists, the treatment of eye diseases by opticians or any other of the offenses listed above, should promptly report it to the Committee on Illegal Practice.

CARCINOMA OF THE COLON

D PHILIP MACGUIRE, A B, M D, F A C S, *New York City*

*Asst Clinical Professor of Surgery, N Y Post-Graduate Medical School and Hospital,
Columbia University*

Carcinoma ranks fourth in frequency among the organic lesions of the large intestine. Approximately seventy per cent of them, occurring in the large intestine, are due to carcinoma. About sixty-six per cent of these malignancies are found in the sigmoidrectal segments. The other amenable areas are the cecal, hepatic, and splenic flexures, and the middle segment of the transverse colon.

For many years, the large bowel has been anatomically divided into the right, the transverse, the left colon, sigmoid and rectal segments. However for practical purposes, surgeons have bi-partitioned the large bowel into the right and left divisions, which differ in development and function. The right section, up to the middle of the transverse colon, is a continuation of that portion of the primitive intestinal tube known as the midgut. Whereas, the left originates at the primitive hindgut. Because of its great absorptive nature, the right segment resembles that portion of the small intestine with which it develops. The left has a different blood supply, is smaller, more contracted, and serves as a storage medium.

Irregularities—mucous diarrhea or alternate periods of diarrhea and constipation, associated with bleeding—are the earlier manifestations. Case histories usually record intermittent staining by mild or severe hemorrhage of an average six months' duration prior to medical examination.

In large metropolitan areas, fully fifty per cent of these cases may be classified as inoperable from the standpoint of radical surgery. Rural districts report an even higher percentage of this inoperable group. This is true, primarily, because the growth is so extensive and firmly entrenched, including the neighboring metastases. Secondly, due to the fact

that the toxemia, so to speak, has devitalized the patient to such an extent, radical surgery cannot be considered. Included in this group are the long-standing carcinomas of the right colon with marked secondary anemia due to the low hemoglobin content. Thirdly, conditions may be discovered, such as diabetes which may be further complicated by nephritis, serious cardiac diseases or other equally grave affections. A small percentage of these complicated cases can be considered operable only after prolonged treatment.

Whenever possible, biopsies of the growths are essential in the operable cases. Should the clinician suspect a malignancy, repeated biopsies are imperative and the growth classified according to the Broder system. Fortunately, most of the colon carcinomas consist of the lower grades, characterized by a gradual development.

Common Fallacies

When clinically in doubt, it is advisable to obtain the results of repeated biopsy specimens rather than accept conclusively, the pathologist's report of the first one. A common fallacy is to regard the invasion of a neighboring viscus by a growth with trepidation, since it may be merely of an inflammatory rather than a malignant nature which may readily be relieved by resections.

Another prevalent misconception is relative to the small type of tumor that evokes a ring-like constriction which is frequently discernible on inspection of the left colon. It appears, on first inspection, that its removal will be easily accomplished. However, these tumors are frequently accompanied by the most serious metastases remote or otherwise.

Preoperative Procedures

The haphazard method, relative to the

*Read before the Queens County Medical Society, Surgical Division,
December 17, 1936*

admittance of colon carcinoma cases for operation the following day, has been discontinued and the preoperative preparation of these patients has been considerably improved. Acute obstruction constitutes the most serious involvement. The mere suspicion of the presence of a colon malignancy should impel the attending physician to immediately prescribe a high caloric fluid diet. This serious complication has a predilection for the left and transverse colon and occurs in about five per cent of these cases. This condition is particularly menacing since the physiological and chemical imbalance has reached such a degree that there exists a marked acidosis, alkalosis, high creatinine, high uric acid urea, and nonprotein nitrogen. In the remaining ninety-five per cent of these cases, chronic obstruction is still a potential if not an actual complication.

Consequently, the oral administration of barium, as a contrast medium, may result disastrously in questionable obstructive cases and its use is open to conjecture.

Should the clinician not know the full extent of the obstruction, the author believes that the barium enemas and gastrointestinal series should be withheld. The inadvisable roentgen examination of these cases, utilizing a contrast medium, is comparable to the immediate x-ray diagnosis for confirmation on suspected cranial fractures a few years ago. These methods not only endangered the patient's life, but frequently turned a propitious case into one of doubtful issue.

Proper bowel clearance, following the administration of the contrast medium, often inconveniences the clinicians and nurses and also hampers the contemplated operative procedures. Even though the blood chemistry determinations may be fairly high, this condition may advisably be best alleviated by utilizing the open cecostomy operative procedure. This operative step is usually not too severe on these patients, and the benefits derived from proper drainage by the insertion of a Paul's tube and applying suction, may be comparable to that obtained from the preliminary gall-bladder drainage in obstructive jaundice cases.

Massive blood transfusions are recommended for improvement of the patient's

general condition. This applies to the palliative as well as the nonpalliative cases, and is also applicable in even severe kidney dysfunction. Phlebotomists from the Moscow municipal hospitals supercede surgeons of other countries notably by the introduction of canned blood, primarily obtained from favorable subjects soon after death which accounts for their numerous brilliant results obtained in massive applications. An increase in uric acid, urea, and nonprotein nitrogen in intra-abdominal carcinomas was most aptly demonstrated by Killian and Kast of our hospital staff in 1918. This serious increase in the blood chemistry determinations, occurring in many colon malignancies, and its relationship to severe dehydration with resultant acidosis and alkalosis, has influenced many surgeons to give increased quantities of fluids when these determinations are very high. The average hematologist will more than likely agree that a twenty-five per cent increase of urea, uric acid, nonprotein nitrogen, and creatinine indicates a serious kidney dysfunction. Prompt action should be instituted to reduce these complications.

Coller and Maddock¹ conclude from their observations that a six per cent loss of body fluids signifies the pathogenesis of a serious dehydration. This implies that the inclusion of greater quantities of fluids is a paramount consideration if it is expected to circumvent the dire, resultant sequelae. The greatest possible benefit can be derived by the oral administration of forced fluids. Should these cases have an impairment of the deglutitive functions, the constant duodenal drip of tap water, advocated by McCarthy and his coworkers of our hospital staff, has shown excellent results. This method consists of the oral introduction of tap water and five per cent glucose solutions given intravenously and subcutaneously. The hematologist's report on the findings (each morning) must be the criteria for the amount of liquid intake. The lax methods used for the introduction of fluids in these toxic cases during the past few years have been very unsatisfactory.

A further misconception is that saline solutions should only be given in cases having a chloride deficiency. In patients

having a blood chemistry determination indicating a severe toxicity, the usual routine method of introducing from one to two thousand c.c. of fluids daily, is worthless

Another deterrent is the failure on the part of the attending physician to order repeated blood cultures to determine the presence of such a serious complication that would contraindicate radical operative procedures

Palliative Procedures

There are two types of surgery applied to the intestine, namely the palliative and the radical operative procedures

About half the number who are unsuitable subjects for radical operation, are in the terminal stages of the carcinoma, characterized by widespread metastases and extreme lassitude whether or not accompanied by some coexistent chronic disease. These cases have palpably received no treatment for their carcinomatous condition. Another small group of cases was treated by x-ray therapy, radium or electrocoagulation, the majority being unsuitable for radical operation owing to one or more of the following reasons: (a) local extension of the carcinoma to the viscera, adjoining the rectum, (b) direct infiltration of the bladder, uterus, broad ligaments, vagina, or prostate, or (c) infiltration of the peritoneum of the pelvic floor, rectal vesicle and vaginal fistulae. It is impracticable to consider performing a radical operation when there is an involvement extending to the liver, the inguinal glands, and the bony framework of the pelvis or spine.

Palliative procedures are advisable for patients averaging from sixty-five to seventy years of age, since the radical operation, at times, produces grave consequences. However, English surgeons have given favorable reports concerning cases exceeding seventy years of age. Only palliative procedures should be used for patients having hypertension in cardiovascular disorders. The palliative operation recommended, is the inguinal colostomy with preference for the author's technic.

The methods of radical operative procedure for carcinoma in the rectosigmoid area are logically divided into those de-

scribed before and after 1920. The earlier operative technic mainly consisted of dividing the bowel, bringing the proximal end out as a single bowel colostomy, suturing the distal, open end, and burying it beneath the pelvic peritoneal floor.

Since 1920, three operative procedures have been extensively used, two introduced in this country, viz., the Rankin and Lahey technic, and that of Mummery in England. Although the Babcock and Coffey technic has many advocates, one can scarcely classify the Mummery operation as a radical procedure, due to the fact that the only intra-abdominal step is the fashioning of a colostomy. Nevertheless, Jones,² one of the greatest authorities of his kind in this country, recommends this operative procedure for inexperienced surgeons. The technic, consisting of a combined abdominoperineal resection of the rectum discussed by Rankin,³ comprises dividing the sigmoid between clamps, bringing out the proximal end as a single bowel colostomy opening, closing the opening on the distal end and, then, dropping it back into the abdominal cavity. The second stage is an abdominoperineal resection of the terminal sigmoid and rectum. In 1930, Lahey utilized the same type of procedure, but kept the distal sigmoid open and employed irrigations for this part of the bowel. The second step was the same as Rankin's, viz., the abdominoperineal resection.

The modification of Rankin's technic, as described in 1929, is a more difficult procedure to apply in obese patients, and Rankin objected to this method principally because division of the bowel would be attended by an increased hazard should obstruction be present, and, in the event that this complication were not present to a marked degree, the rectum could be just as satisfactorily irrigated by a two-way tube.⁴

In 1908, Miles described a method of performing an abdominoperineal excision for carcinoma of the rectum and the terminal portion of the pelvic colon which has since become a classic.⁵

In practically all the operative procedures described before 1920 and up to the present time, for carcinomas in the sigmoidrectal area, is included a division of the bowel, performed intraperitoneally

which palpably invites the dreaded complication of peritonitis. To circumvent the possibility of postoperative pneumonia, as a secondary complication, it is essential to administer spinal anesthesia, using either spinocaine, neocaine, novocain, pantocaine, or a mixture of neocaine and pantocaine. It should be strongly emphasized when patients complain concerning the insufficiency of the spinal anesthesia, the advisability for the postponement of the operative procedure until a later date, when another mixture of spinal anesthesia may be used.

Conclusions

The author's method for the removal of malignancies, in the sigmoidrectal area, is the only aseptic surgical procedure that he has seen described to date. Since the first step in these operative procedures consists of cutting across the bowel intraperitoneally, which may result fatally, this method should especially appeal to the younger surgeon. This procedure should also appeal to those surgeons who, like the author, have experienced the loss of patients during this preliminary step owing to an involvement in the peritonitis. These two menacing complications—peritonitis and postoperative pneumonia—are combatted by this aseptic technic accompanied by the induction of spinal anesthesia.

The main objection to the preliminary step of cecostomy is the loss of fluid. However, by taking daily blood chemistry determinations, this can be properly gauged and replaced by sufficient fluid or blood transfusions. A preliminary cecostomy presents many advantages, one of

the most salient being that the incision for the second step is made on a clean surgical field. The open cecostomy method also permits the operator to palpate the entire colon. Should multiple growths exist or a distant metastases accompany a minute neoplasm, this knowledge is invaluable for estimating the remainder of the second step. Specific importance is attached to the palpation disclosing a malignant invasion of the spleno-mesentery group of glands, which invariably indicates a very poor prognosis.

An open cecostomy is a definite safeguard since the actual fashioning of a single bowel colostomy is more complex than the theoretical description of this procedure implies.

The author firmly believes that the following adjuncts to the performance of an operation are more thorough than other methods, and should therefore be considered of corresponding importance, viz., the before-mentioned aseptic for minimizing the danger of peritonitis, the use of spinal anesthesia to avoid the appearance of postoperative pneumonia complications, and the generous introduction of a sufficient quantity of fluids and blood transfusions to counteract dehydration which is calculated by daily blood chemistry determinations, in order to conserve the strength of the patient.

THE GIFT OF LIFE IS NOT ENOUGH

"It is not enough for a mother to have carried her child in her bosom, to have nourished it at her breast, an even heavier responsibility awaits her—that of rearing her babe and forming its character. For the successful performance of this mission, maternal devotion and solicitude are not sufficient, it demands a knowledge of the laws of physical and moral health, of the factors that make for racial strength and continuity.

"Thus apphes not only to mothers but to fathers as well, for upon them falls a very large share of responsibility for the future well-being of rising generations.

"The vitality of a child, as well as his physical and moral development, depend to a very great extent on environment and on the care bestowed upon him in his early years. Without health, life cannot flower and thrive"—Prince Carl of Sweden, *President of the Swedish Red Cross*

ADENOMA, ADENOCARCINOMA OF THE ADRENALS

Based on a Series of 34 Cases

HENRY M FEINBLATT, M D and BARNETT ALPERT, M D, Brooklyn

Attending Physician and Chief of Metabolic Clinic, Kings County Hospital, Clinical Professor of Medicine, Long Island College Hospital, Pathologist, St. Peter's Hospital—Assistant Attending Kings County Hospital, Instructor Long Island College Hospital

There is very general agreement among authors that adenoma of the suprarenal cortex is an uncommon finding. The experience of Gibson¹ is frequently cited. Examining the records of 46,000 admissions at the University of California Hospital (July 1913-March 1926), he found but nine recorded as having a diagnosis of adrenal tumor confirmed.

Burke,² of the New York State Institute for Malignant Diseases, considering autopsy findings upon 371 cases, found forty-nine subjects who showed malignant metastasis of the adrenal glands, but only two where there was an adenoma primary to the gland.

Geschickter,³ while stating that primary tumors of the suprarenal tissues are "not common," goes on to say that the most frequent tumors of the suprarenal cortex are the benign cortical adenomata, which are incidental findings at autopsy and rarely give clinical indication of their presence. He found carcinomata of the suprarenal cortex to be "much rarer," but, when encountered, they can usually be identified by clinical manifestations affecting the secondary sexual characteristics of the patient.

Some writers believe that benign cortical adenomata "are present in nearly one third of all cases examined at autopsy, regardless of age, sex or cause of death," but Geschickter's experience, and that of the other writers cited above, does not agree with this view.

Since there seems to be so much confusion and disagreement concerning many features of neoplastic growths in the adrenals, the publication of the present series of adrenal neoplasm is justified, as it is only by the amassing of considerable clinical evidence that we may hope to reach sound and rational inferences.

Pathological Anatomy

The tumors were readily recognized because of the prominent projecting masses, yellow to red in color. Some had areas of hemorrhage and softening either in the tumor or surrounding it. They were usually single but commonly appeared bilateral. In none of the cases was there definite capsule formation.

Microscopically, the distinguishing characteristic of the adenoma was the cortical cell structure with a variable stroma of small capillary vessels and connecting tissue. The epithelial cells were larger and showed a greater tendency toward hyperchromasia and fatty changes. The cells, in some places showed luminal arrangements and in others there was a tendency toward papillary formations but with the same type of large, clear, granular, fatty cell. Pigment formations were not observed.

It is mentioned by Grollman⁴ that, although frequently manifesting all the signs of normal functional activity, the adenomata are sometimes found at operation or autopsy to be "in varying stages of lipoidal degeneration."

Symptoms

Many adenomata of the adrenals are quite symptomless, their existence being discovered only when the patient has died of some unrelated cause or because of some secondary manifestation not referred to the adrenals during life. This was illustrated by our seven nonmalignant cases, in no one of which was the presence of adrenal adenoma suspected before death.

Many similar instances are to be found in the literature. In most of these cases, however, symptoms insufficient to permit the establishment of a diagnosis will be

correlated to the conditions revealed at necropsy. Data are still lacking to enable us to evaluate properly these "silent" cases. Despite the extensive research and study which has been devoted to the adrenal glands during the past quarter century, there yet remains a wide field for investigation.

Two members of the Medical Faculty at Lille, France, Langeron and Lohéac,⁵ recognizing the necessity of more reports upon the clinical manifestations of tumors of the suprarenal capsule, established the following classification by which the different symptom-complexes may be recognized:

- 1 Tumors producing an endocrine syndrome.
- 2 Tumors of "abdominal" type.
- 3 Metastatic tumors
- 4 Tumors accompanied by arterial hypertension

In reviewing the literature, these authors were particularly impressed by the large preponderance of bilateral cases reported. For this they offer two explanations. Either the close proximity of the two glands and the intimate relation of their blood and nerve supply bring about simultaneous activity in the production of a typical cell structure, or the neoplastic growth being established in the gland, the other is so quickly involved because of the same close relationship that examination when the condition is far advanced—practically always the case—fails to disclose which one was the first attacked.

The clinical evidences of tumors of the first group may be (a) suprarenal insufficiency, or (b) the genitocortical syndrome of suprarenal virilism, i.e., obesity, sexual precocity in both sexes, and in females appearance of masculine secondary sex characteristics, hirsutism, etc. A striking case of the second type due to malignancy of the adrenal was reported by Feinblatt⁶ in 1926.

In the second group as classified by Langeron and Lohéac, the symptoms are those common to abdominal tumors of all types, due to pressure and displacement of adjacent viscera. They include lumbar pain, radiating upward and increased by palpation, lumbar tumor simulating renal or hepatic cyst, and other pressure symp-

toms, according to the size and site of the adrenal growth.

The third group—metastatic tumors—gives infinitely varied symptoms, according to location. Most common are those to the orbit, producing the "black eye" which is often the first indication in small children, to the brain, which give evidence of cranial hypertension, or vascular obstruction, producing symptoms depending upon location.

The fourth group, comprising those tumors of the adrenals which manifest their presence by arterial hypertension, is regarded as the most interesting, although as yet the least understood type. In this last class can be placed most of the "silent" adrenal growths, such as the seven cases presented in the series occasioning the publication of this paper.

Grollman,⁴ however, opposes this theory of the hypertensive effect of adrenal tumors. He asserts that it has been repeatedly shown that there is no increase in the epinephrin content of the blood in such cases. It was because of the fact that epinephrin, when injected, produces so marked a pressor effect that many investigators inclined to believe that essential hypertension might be due to over-activity of the adrenal medulla.

Of the seven cases, only one showed hypertension. We could not attribute the hypertension as due to the adenoma.

However, a comparison of the pituitary and adrenal syndromes was made recently by Lescher and A. H. T. Robb-Smith,⁷ who reached the conclusion that even when adenoma of the adrenal cortex can be demonstrated, hypertension is more likely to be due to pathological activity of the basophile cells of the pituitary.

A case wherein adenoma of the adrenal cortex simulated pituitary basophilism was reported in 1935 by Calder and Porro.⁸ "This case was thought clinically to be an instance of pituitary basophilism (Cushing's syndrome), but at autopsy a large primary adrenal neoplasm was found, and the hypophysis was normal." Similar reports have been made by Kepler and others.⁹

Statistics on Thirty-Four Cases of Adrenal Neoplasia

This report is based upon thirty-four

cases Twenty of these growths were adenocarcinoma, primary to the gland, seven were metastatic, the adrenal growth being secondary to carcinoma elsewhere in the body, the remaining seven adrenal adenomata were autopsy observations, in none of which the presence of the adrenal tumor had been suspected during life. Of the primary adenocarcinoma, the diagnosis was established by autopsy in nineteen cases, and by biopsy in connection with surgery in one case. The seven subjects of metastatic involvement of the adrenals were all recognized at autopsy only.

Race In none of the cases was there a family history giving a clue to hereditary tendency. The group included Italian, Norwegian, Polish, and American ancestry. All were white, and although Negroes constitute a large percentage of our hospital admissions, we have never observed adrenal tumor in any member of this race.

Age In the primary adenocarcinoma the average age was forty-five, the youngest subject being two years old and the oldest seventy-two. In the metastatic cases the average was fifty-five years, the oldest sixty-two and the youngest forty. Of the seven cases of benign adenoma, the average age was sixty-one years, the oldest being seventy-five and the youngest forty-two.

Sex Our experience coincides with that of other writers that sex seems to have no influence on the occurrence of these neoplasms. In our series males were in the majority, there being fifteen males and five females among the cases of primary adenocarcinoma, six males and one female among the metastatic cases, and four males and three females among the nonmalignant cases. The type of tumor which produces the corticogenital syndrome appears more frequently in females. The patients seen at the Mayo Clinic by Walters, Kepler, and their co-workers⁹ were all women and girls. Calder and Porro's⁸ patient had formerly been a trained nurse. Lescher's⁷ patient was also a woman. Feinblatt's⁶ case reported in 1926 was in a female physician.

Blood pressure In view of the discussed relation between "essential" hyper-

tension and adrenal disease, the blood pressure records of all patients should be studied with care. In our series of twenty adenocarcinomata the blood pressure ranged from 100 to 170 systolic and from 50 to 100 diastolic, while the metastatic cases ranged from 112 to 170 systolic and 50 to 90 diastolic. In the subjects whose adenomata were found only at autopsy the range was from 84 to 276 systolic and from 54 to 126 diastolic. The numbers are too small to permit the drawing of any sound inferences other than that there was no consistent evidence that tumors of the adrenals gave any consistent change in the blood pressure.

Clinical and laboratory findings Neither urinalysis nor blood chemistry yielded any significant findings. Hemoglobin in the primary adenocarcinoma cases was from forty to ninety per cent, in the metastatic cases, from sixty to eighty per cent. There was but one positive Wassermann reaction, which occurred in one of the metastatic cases.

Pain This was a prominent feature in nearly all cases—in the "silent" adenomata, there was chest pain in two cases, back pain in one. In nineteen of the twenty malignancies pain was complained of—chest pain in five, leg pain in three, abdominal pain in seven, left shoulder pain in two, back pain in one, pain on the right side, in one. In the metastatic growths pain was recorded for six out of seven cases—abdominal pain in three, back pain in two, leg pain in one, pain in left shoulder in one.

Other symptoms Not one case of the series presented anything which could be called a typical "suprarenocortical" syndrome. Headache was present in six cases, cough with hemoptysis in seven, without hemoptysis in three, nausea and vomiting in six; loss of weight and strength in fourteen, paresis in two, convulsions in four, and various scattered instances of visual disturbance, personality change, difficulty in urination, etc. But one instance of pigmentation was observed—in a primary adenocarcinoma patient. Hirsutism was seen in but a single female patient, and in her case there was a complicating cyst of the pituitary gland.

Location of growth On autopsy, eleven

of the cases of primary malignancy four of the metastatic cases and three of the seven cases of benign adenomata showed involvement of both adrenals. Of the remaining fifteen patients, six showed the growth in the left adrenal and nine in the right. In one case adenocarcinoma was present in the left adrenal and the right gland was found to be the site of a tuberculous focus.

Metastasis Of the twenty primary cases of adenocarcinoma included in this series, in nineteen autopsies and one operation, metastasis was observed in all but one, wherein the malignant growth had an associated tuberculosis of the opposite gland. Nearly every organ in the body would be included in the list of the locations of these secondary deposits. In the cases where the adrenals were secondarily invaded from an original focus elsewhere located, the source is recorded as the liver, the spleen, the brain, the lungs, and the lymph nodes. In some instances the original focus could not be determined accurately.

Summary

A correlation is made of the history,

clinical symptoms, and autopsy findings in thirty-four cases of new growth of the adrenals. In twenty instances, the tumor was primary, in seven, the new growth was metastatic in origin and secondary, in seven cases, the tumors were benign adenomata.

Not one of these cases presented the typical "suprarenocortical" syndrome which has been described in recent periodical literature. The finding of an associated tuberculosis of the opposite adrenal in one of the primary malignancies is unusual. In recognition of the prevalent trend of association between adrenal disease and "essential" hypertension, the blood pressure records were carefully noted. They showed wide variation.

The diagnostic difficulties presented by these adrenal growths were emphasized by many cases in this series. It is the authors' hope that others will be stimulated to record their own experiences, so that much more material may be made available for study.

MEDICINE FOR THE SOUL

Physicians and ministers are in the best position to help those who in the midst of defeats and tragedies have lost faith, hope, and courage. Back of the patient's fear is something that has destroyed his courage. Back of the fatigue, the exertion, the tremors, the palpitating heart lie the de-

stroyers of faith and hope. It behooves the physicians, therefore, to find them. In many instances those symptoms are but a cry for sympathy and understanding and the remedy is one of restoring faith, hope and courage—*Pennsylvania Medical Journal*

AMERICAN HEART ASSOCIATION

The Thirteenth Scientific Sessions of the American Heart Association will be held on June 7 and 8, from 9 30 A M to 5 30 P M in the Viking Room, Hotel Haddon

Hall, Atlantic City. On June 7, the program of the Section for the Study of the Peripheral Circulation will be given, the general heart program on June 8.

CHRONIC ALKALINE ENCRUSTED CYSTITIS

Cure of Case with Contraction of Bladder by Vitamin A Regime and Indwelling Catheter

MAURICE MELTZER, M D, *New York City*

Urological Department, Broad Street Hospital and Pan-American Clinics

A young woman of twenty-two years, presented herself on June 21, 1934, complaining of marked urinary frequency, nocturia, urgency, tenesmus, and terminal dribbling, extending over a period of three years. About every thirty minutes, both day and night, she voided small amounts of dirty dark brown urine and wore vulva pads to avoid soiling her clothes. She practically spent all her time near a bathroom and was forced to give up her occupation. Her past history was irrelevant except for an important clue, in that she restricted her diet chiefly to cereals, spaghetti, bread, soups, and starchy desserts in the hope of relieving her distressing symptoms. During this period she was hospitalized on three occasions and had submitted to various urological examinations and local treatments without obtaining relief.

Physical examination revealed a young woman weighing 110 lbs, rather haggard from loss of sleep, but disclosed no objective symptoms in any other part of her body. Abdominal and loin palpation revealed no masses or localized tenderness. The voided urine was dark, dirty brown with heavy brownish sediment. On analysis it was strongly ammoniacal and alkaline, showed a specific gravity of 1.028, marked trace of albumin, few hyaline casts, scattered pus cells, and an abundance of red blood cells (4+) and ammonium urates (4+). X-ray of the urinary tract revealed no calcareous shadows, etc. The bladder capacity was but one ounce. She was extremely sensitive to cystoscopy. No bladder landmarks could be visualized because of massive, diffuse, brownish incrustations throughout the bladder. The ureter orifices were seen only after an intravenous injection of indigo carmine which revealed good function from both kidneys. Intravenous excretion urography films disclosed normal kidney and ureter outlines and a small round infantile-size bladder (Fig 1-3). A diagnosis was made of chronic alkaline encrusted cystitis with secondary contraction of the bladder.

Two very simple and rational principles of treatment were advised and instituted: (1) Vitamin A was given together with a balanced acid ash diet plus the addition of ammonium chloride to acidify the urine, (2) An indwelling catheter was inserted for the double purpose of giving complete physiological rest to the irritated bladder and urethra and of gradually dilating the contracted bladder with an acid solution.

1 Vitamin A regime together with acidification of the urine undoubtedly played the greatest role in the cure of the alkaline encrusted cystitis. What prompted the use of Vitamin A regime and acid drug therapy? It is well to briefly review the modern conception of the causes of urinary calculi before answering the hypothetical question. During the past decade experimental and statistical studies on the subject of urinary lithiasis have been made by various workers. Neither climate nor the character of the drinking water have any influence on stone formation. The causes for the formation of many calculi are still unknown. This much is known that when certain colloidal changes occur in the urine, the salt most in excess deposits in crystalline form by precipitation. The nucleus of such a calculus is an agglomeration of crystals in a urinary colloid. Primary stone formation in an aseptic urine is due to colloidal precipitation. Secondary stone formation is favored by infection, especially in the presence of either congenital or acquired obstruction of any part of the urinary tract. It is generally believed that uric acid calculi result from faulty body metabolism. Some years ago Rosenow and Meiser in animal experiments, demonstrated that infection from septic foci arising from infected teeth or bone inflammation produces calculus by an excess of calcium elimination. In the past few years calculus disease has been observed in the bed-ridden suffering from fractured femurs, osteitis fibrosa, bone tuberculosis, chronic osteomyelitis, and other severe bone diseases as well as chronic empyemas. In these types of cases two factors are held accountable for calculus formation: (a) prolonged immobilization, and (b) a change

Read before the Clinical Meeting of the Manhattan General Hospital, November, 1936

in the calcium metabolism which releases an increased amount of calcium into the blood stream and urine. Observers from Boston hospitals report that they have dissolved such newly formed calculi by vitamin A therapy. Similar calcium disturbances have also been recently brought to our attention in parathyroid disease.

That urinary lithiasis in many instances is a deficiency disease is borne out by Jolly's interesting observations that calculus is most commonly encountered in districts where the general hygienic conditions are poor and where the dietary is mainly derived from cereals, *whereas stone formation is infrequent in dairy farming districts.* The large-

also of other mucous membranes. Wide spread metaplasia and infection throughout the body have been repeatedly demonstrated when vitamin A is lacking in the food of experimental animals. In the epithelial linings of the urinary passages keratinization most commonly occurs, this favors both colloidal precipitation of urinary salts and local infection. Pyelitis and cystitis are reported as sequelae from this deficiency.

The modern approach to the whole subject of urinary lithiasis consists not only in the removal of stones by surgical or non-surgical means but it is also necessary to study the patient's metabolism and to est-

Fig 1 Intravenous urogram showing small bladder in twenty-two year old female. (Chronic encrusted cystitis). The normal size of the adult bladder by cystogram examination is about the size of a large orange.

Fig 2 Intravenous urogram showing size of bladder in two year old child.

est stone centers are in Central Russia, India, China, and Mesopotamia. It has been further shown that the incidence of calculus is lessened in these regions, especially in children, when a mixed diet containing the protective vitamin food stuffs is substituted and when the general hygienic surroundings are improved. In 1926, Fajernacki conducted a series of animal experiments in which he demonstrated the formation of calculus in the kidney, bladder, and gall-bladder when the animals were given a diet deficient in vitamin A. He was able to dissolve these stones by the addition of milk, butter, and cod-liver oil. Recently C. C. Higgins observed that vitamin A deficiency in experimental animals produces strong alkalinity of the urine. From these and other observations the hypothesis is advanced that there is a close relationship between an adequate supply of vitamin A and the healthy state of the mucous membranes not only of the urinary tract but

mate the blood uric acid, serum calcium, phosphorus, etc. After a stone passes out or is removed, its composition is determined by analysis. Careful study should also be made of the reaction or hydrogen ion content (pH) of the urine, a urinary alkalinity of (pH) 6.8 is necessary for acid stones and a pH of 5.2 acidity is necessary to prevent the precipitation of alkaline salts. It is also important to eradicate or reduce to a minimum any local or focal infections and to prevent urinary stasis in the kidney pelvis and bladder by appropriate treatment of congenital or acquired obstructive uropathies.

The chief sources for vitamin A are cod liver oil and the so-called protective food stuffs derived from plant materials. In these foods vitamin A is present in the form of carotene which is transformed into vitamin A when taken into the body. Normal digestion and absorption of fats are essential for the utilization of this food factor. Foods containing vitamin A are milk, cream, butter, cheese, egg yolks, liver, fresh vegetables and fruits.

In the case described herein several urine analyses, both before she consulted me and before I began treatment, showed a strongly ammoniacal alkaline urine loaded with ammonium urates. These repeated urinary findings make it reasonable to assume that even before the onset of her symptoms a disturbed body metabolism resulted in the precipitation of uric acid salts. Eventually, because she subsisted on a deficient diet, strong alkalization set in. This together with colloidal changes in the urine most likely account for the massive encrustations of ammonium urates. *Vitamin A was therefore utilized to overcome deficiency of an inadequate diet and because of its specific effect on the epithelial lining of the urinary bladder.*

On admission to the hospital, June 30, she was placed on a balanced acid ash diet, consisting of all dairy foods, fresh fruits, fruit juices, fresh vegetables, whole wheat bread, yolks of egg, chicken, beef, veal, liver, fish, and forced fluids. Cod-liver oil capsules were administered four times daily. Condiments and seasoning were eliminated. Enteric capsules of ammonium chloride grains twenty were given four times daily to acidify the urine. *Four days after admission the urine draining by way of the indwelling catheter was clear and acid in reaction. It has remained acid and clear ever since. Ammonium chloride medication was discontinued after nine weeks. She has remained on a balanced diet and cod-liver oil.*

The clinical course in this case strikingly supports the experimental work and observations referred to above, namely, that calcareous formation in the urinary tract may be caused by a diet deficient in protective vitamins and that calcareous concretions resulting from such a diet may be dissolved by one rich in vitamin A. The interior of this contracted bladder was practically a small plaster cast mould, whose capacity was only one ounce. The strong vitamin A diet together with the acidifying drug apparently dissolved the alkaline encrustations clinging to the mucosa of the bladder. As the encrustations became completely dissolved, the normal elasticity readily increased. The increase in bladder capacity from thirty to two hundred c.c. reveals the latent elasticity of a hollow muscular viscus, whose interior was firmly bound down and contracted over a long period of time by the encrusted cystitis.

2 A self-retaining mushroom catheter #22 French scale was inserted. This automatically did away with voluntary urination so that the irritated bladder and

urethra were completely put at rest. At two hour intervals very gentle bladder irrigations were given. Irrigations were begun with one ounce of one-quarter per cent phosphoric acid solution. The nurse was instructed to inject the solution very slowly and to stop when the patient complained of discomfort or pain. Each day, if possible, the amount of injected fluid was increased and a record kept of the increasing tolerated amounts. Five days after admission fifty c.c. of fluid were easily injected and at the end of two weeks when the catheter was withdrawn seventy-five c.c. were injected without discomfort. She was kept in the hospital four additional days for the continuation of

Fig 3 Retrograde cystogram, two year old child

bladder lavages and dilatations. She now voided every two hours during the day and three to four times during the night and was free of tenesmus—as contrasted with the distressing urinary symptoms which had persisted for three years. She gained twelve pounds, her lassitude was replaced by a feeling of well-being, and she evidenced a new interest in life. Relief of subjective symptoms and general improvement are readily explained by the fact that she no longer was harassed by a constant urinary urge, because for the first time in three years she caught up on much-needed sleep and was able to digest and absorb large quantities of a well-balanced diet.

When discharged, she was instructed to keep up the bladder dilatations for a few additional months. At first she reported twice a week for six week period and gradually the intervals were prolonged to once in eleven days and finally about every four to six weeks. One month after discharge from the hospital she voided every two hours by day, two to three times by night, the urine was acid and clear and

eighty-five c.c. of solution were slowly injected and tolerated. In fifty days her bladder capacity increased to one hundred c.c., in sixty-two days it was one hundred and fifty c.c. and in eighty-five days the bladder tolerated two hundred c.c. She now voided every three hours by day and two times per night. Eighty-five days after she left the hospital the bladder capacity was about six times greater than it had been during a three year period. At this time cystoscopy revealed a normal appearing bladder, entirely free of any incrustations. She resumed her usual occupation as a factory worker. She married in April 1935, and thirteen months later went through a normal delivery. During her entire period of pregnancy she remained free of urinary symptoms.

Conclusions

1 A case of chronic alkaline encrusted cystitis with secondary contraction of the bladder was cured by two very simple

principles (a) Vitamin A regime with acidification of the urine undoubtedly played the greatest role, (b) The indwelling catheter gave physiologic rest to the irritated bladder and urethra and permitted frequent bladder lavages and gradual bladder dilatations.

2 The clinical result in this case, probably the first on record, strikingly supports experimental work and observations that calcareous formations in the urinary tract may be caused by a diet deficient in protective vitamin A and that such calcareous concretions may in turn be dissolved by a diet rich in vitamin A.

3 No definite conclusions can be reached from one case report. Further use of this kind of therapy in similar cases will definitely evaluate the relationship of vitamin A deficiency to urinary calculi.

10 PARK AVE

SECRET REMEDIES

Since the dawn of medicine there have been secret, alleged "cures" for cancer and other diseases. The literature on the subject is enormous. Many remedies that have been sold for decades are still used even though no scientific evidence that will stand analysis has ever been presented to substantiate the claims of the manufacturers. Recently a young physician approached a member of the staff of a world recognized research institute and asked him to cooperate in trying out such a remedy. The request was denied, for *the remedy was a secret one*.

Ever since the medical profession has had a formal or even informal code of ethics, secret remedies have been frowned upon. At the present time most recognized medical societies distinctly forbid the use of such remedies by members. Most laymen, and even some physicians, cannot understand what is wrong with their use, which he demands that the patient understands the situation. The patient understands the situation, bladder when the ank of being repetitious and, deficient in vitamin. *Journal of Medicine*, stating the case against dissolve these stones, as it has already milk, butter, and cod-liver, leaders of medicine, C Higgins observed that below in an efficiency in experimental animal of secret remedies, strong alkalinity of the urine. by those that and other observations the hypothesis, conduct in vanced that there is a close relationship between an adequate supply of vitamin A and the healthy state of the mucous membranes not only of the urinary tract but

one man asks another to try his secret remedy, he is asking him to trust him not to put any poisons into the material and to keep the formula unchanged from one lot to another. On the other hand he is not trusting him with any important information as to his product. The trust is there for entirely one-sided and not mutual. An honest man cannot ask this much of another man. Even the law, which many physicians and scientists think is a somewhat backward code, has recognized for centuries that a contract to be valid cannot be entirely one-sided. A person arguing for the use of such secret remedies might ask, "How about the trust between doctor and patient even when no secret remedy is used, is not the trust that the patient must put in the doctor's knowledge and skill always one-sided?" It is not. The patient must often trust the doctor in matters that he cannot understand, but in return the doctor trusts the patient to repay him for his services either in money or otherwise as the case may be.

A person with an investigative type of mind might ask, "Would you deprive the world, even for a few days, of the possible great benefits from this invention just because the inventor wishes to keep it a secret?" The answer must be "Yes." The world has always given and will always give honor, and frequently, great financial recognition to the scientist who makes a great discovery as soon as its greatness is proved.

TRAUMA IN THE NEWBORN

W MORGAN HARTSHORN, M D, *New York City*

From the Pediatric Department of the New York Polyclinic Hospital

Note. Following a brief discussion of the various forms of trauma to which the newborn is exposed, illustrations of important birth injury from cases at the New York Polyclinic Hospital during the past five years, are presented.

Birth trauma may result in (1) Wounds and abrasions of soft parts (2) Caput succedaneum, cephalhematoma (3) Fracture and injury of bones, and dislocations (4) Hemorrhages (5) Injury to muscles and internal organs (6) Nerve involvement and spinal cord injury. These conditions arise from either constriction within the birth canal, instrumentation or manipulation in the process of delivery.

Wounds and Abrasions

Wounds and abrasions are seldom serious and respond readily to simple surgical measures. The danger of serious infection must never be overlooked.

Caput Succedaneum

This condition arises, due to pressure of the uterus and pelvic diaphragm, causing interferences with the circulation of the blood and lymph, resulting in infiltration of the surrounding exposed tissues. Its location depends largely upon the presenting part. In L.O.A. and R.O.A. the infiltration takes place over the left or right parietal bones, in face presentations, over the presenting features, causing disfiguration in the brow over the forehead, in breech, over the posterior portion of the thighs and genitals. The tumor is of a soft doughy consistency, about the size of an egg, extent not bounded by sutures. No treatment is necessary as it usually disappears within a few days.

Cephalhematoma

This consists of an effusion of blood between the pericranium and the skull, or

between the dura and the skull, due to the tearing of blood vessels. It is characterized by a swelling which generally occurs soon after delivery, and which is limited by the sutures. It reaches its maximum size in about one week. Upon palpation, the impression may be gained of a groove or defect of the bony structures of the skull. This is due to the formation of bony tissue which grows from its periphery, the result of destruction of osteogenic tissue. The absorption of the effusion takes place rapidly, but the resolution of the tissue sometimes lasts from six to eight weeks or longer. If there is no complication, treatment is unnecessary.

Fractures and dislocations

Dislocations, especially of the shoulder and hip joint, are less common than the fractures which involve most frequently the skull, long bones, and the clavicle. They are, of course, due to prolonged labor and to instrumentation, or to a difficult delivery. X-ray, in fractures, is most important. The fracture of the skull may involve the occipital, parietal or frontal bones. Others may include orbit, lachrymal bones, and mandible. As the symptoms are closely related to intracranial hemorrhage, they will be discussed later. Fracture of the clavicle, due to pressure of the shoulders, against the pelvic bones, occurs most frequently in vertex presentations. The important symptoms are lack of motion in the arm, or the effected side, depression of the shoulder and crepitus. Complications may involve the brachial plexus. Fracture of the long bones, due to pressure and traction, are diagnosed from the inability of the infant to move the extremities involved, by the usual direct signs of fracture and by x-ray. Fortunately most of these fractures are simple, and respond readily to rest and immobilization. Trauma periostitis may occur after breech

Read at the Graduate Fortnight, October 19, 1936

extraction due to traction upon an extremity This may be due to slipping of the periosteum near its attachment to the epiphysis

CASE 3163 Mother aged twenty-five years Had one child one year ago with average normal labor Version, breech extraction of a normal living male baby, weighing $9\frac{1}{8}$ lbs Indication face presentation, failure of chin to rotate anteriorly Solid blade forceps application attempted (high) previous to version, unsuccessful Total hours of labor $10\frac{1}{2}$

X-ray The left clavicle is fractured There is overriding of fragments

CASE 896 Pre-eclamptic toxemia. Low forceps delivery of normal male child 8 lbs, 12 ounces Indication—uterine inertia, total labor $3\frac{1}{2}$ hours Fracture of middle third of right humerus

X-ray Humerus is fractured in the lower part of the middle third The line of fracture is oblique There is overriding of the principal fragments (5 days later) Overriding and displacement of the principal fragments

CASE 269 Mother aged thirty-six Mid A forceps delivery of normal male baby weighing 82/16 lbs Right oblique episiotomy There was an occult prolapse of the cord which was caught in the forceps blade Total hours of labor thirty-four

X-ray There is a fracture of the occipital bone just posterior to the foramen magnum There are some signs of a fracture line in the parietal region near the sagittal suture There is delayed calcification of the parietal bone. (One month later) There are signs of callous at the occipital fracture and improved occlusion of the fissure in the super parietal region.

January 18—Child was forceps delivery There is a left facial paralysis and hematoma over the occipital region of skull, left eyelid, ear, arm, and back near scapulae. General condition is fair Infant has cerebral injury Impression Cerebral hemorrhage.

January 31—Child appears fairly responsive. Still shows some left facial paralysis (according to reports this is clearing up) There are no other apparent palsies although legs are a trifle spastic There is a large hematoma over the right occipito parietal region. Infant is feeding well and gaining weight. X-ray shows a fracture of the occipital bone and parietal bone. Advise expectant treatment It may be necessary to aspirate the hematoma at some later date, but advise waiting

February 27—Hematoma aspirated about eight c.c. of old blood evacuated Some bony deformity in region of hematoma Advise x-ray of skull Baby still presents a left facial weakness which is not as marked as when last seen General condition seems good

March 1—General condition good. Discharged March 2

CASE 1209 Mother aged twenty Medium forceps delivery of living female child Mother

and baby in good condition. Total labor ten hours Baby nursed well until ten days when it seemed listless Had a weak cry and difficulty in swallowing Fifteen c.c. of blood was given in the lumbar region Spinal tap showed bright red fluid Five c.c. were removed. Oxygen was given. Spinal tap repeated later in the evening and bloody fluid removed. Next day became cyanosed and died at 3 30 PM Before death, there was some slight twisting of the mouth with eyes, and muscles flaccid. Chest showed many coarse rales Marked systolic murmur over apex which was very marked in pulmonic area, second space.

Autopsy Head showed no evidence of forceps markings There was very little sub-aponeurotic hemorrhage. A wide separation and bulging of the bones of the skull as well as bulging of the fontanelles were found. There was a small amount of hemorrhage along the sagittal parietal suture without lifting of the periosteum There was no evidence of fracture of the parietal bones On opening the skull a diffuse unclotted hemorrhage was found over the left hemisphere extending anteriorly and centering particularly over the left anterior temporal lobe On the right there was very little hemorrhage except over the anterior margin of the temporal, which was subarachnoid in location The brain stem was severed so as to expose the tentorium. There was marked hemorrhage around the optic chiasma and incomplete laceration was found in the left tentorium to the mesial side It was about $1\frac{1}{2}$ cm in length and was ragged in outline. Dark clotted blood could be seen through the tentorium. The tentorium was lifted and a large blood clot was found pushing the left portion of the cerebellum to one side. It was imbedded in the substance of the cerebellum producing some pressure necrosis The clot measured approximately $2\frac{1}{2}$ -3 cm. There were a number of smaller clots attached to the base of the skull and a few on the right, but in those locations they peeled away from the brain when they were lifted out. The intracerebral fluid was bloody but there was no hemorrhage into the ventricles The choroid plexus was pale. Then the periosteum was peeled away from the occiput, a bilateral transverse laceration was found in about the middle portion measuring two cm. in length on each side. This must have been the result of some pinching force upon the occiput. Microscopically, the cerebellum showed hemorrhage, edema, and pressure necrosis

Diagnoses Cerebral contusion, bilateral fracture of the occipital bone, incomplete left tentorial laceration, massive left subtentorial hemorrhage, and intracerebellar hemorrhage (left), diffuse subdural cerebral hemorrhage (left), subarachnoid hemorrhage both temporal lobes and around the base of the brain, early cystic ovaries

CASE 184 Mother was admitted at 5 30 PM with hard labor pains every two or three minutes Fetal heart heard in the left lower quadrant at a rate of 120 to 150 $4\frac{1}{2}$ fingers dilated Water intact and bulging head pre

senting At 10 35 P.M. was delivered by version and breech. Extraction of a dead child as medium episiotomy. Position of vertex, compound head and arm, and fetal distress was indication for procedure. Duration of labor about three hours and five minutes. Mothers urine was negative.

Autopsy Examination of the head. When calped a number of small, diffuse, subaponeurotic hemorrhages were found over both parietal and occipital regions. On opening the skull, a single layer of blood was found over both cerebral hemispheres. On the right it was due to a rupture of the sagittal sinus. No blood clots were found. The ventricular fluid was blood tinged. No blood clots were found in the ventricles. A small tentorial laceration was found over the left lateral sinus.

Examination of the neck revealed a complete anterior dislocation of the atlas from the axis, so that the distance of about one cm. could be felt as the degree of anterior dislocation of the head upon the neck.

Diagnoses Anterior dislocation of the atlas and head with fracture of the spine, cerebral confusion and tentorial laceration, death in utero.

CASE 1708 Mother had one child twelve years ago (difficult forceps), another child nine years ago, operation for repair of cervix several years ago.

Membranes ruptured one week ago. Premature labor about seven months. Internal podalic version and breech delivery of living male child. Total labor fourteen hours. Baby lived nine hours.

Autopsy There was slight edema of the subaponeurotic tissues but no evidence of hemorrhage. The skull was opened and the brain showed marked edema with accumulation of fluid between the arachnoids but no evidence of hemorrhage. There was no evidence of tentorial laceration. The cerebral fluid was clear. Examination was made for fracture of the skull and two small fractures were found in the right occipital bone, one measuring about $1\frac{1}{2}$ cm in length in the middle portion, and the other at the point where the two ossification lines meet in the right lateral region. There was a rather wide and incomplete separation between the occiput and axis posteriorly so that the separation was about $\frac{1}{2}$ cm.

Diagnoses Prematurity and partial asphyxia, fracture right occiput, incomplete separation of occiput and axis.

CASE 796 Mother aged twenty-six. Delivery by low mid forceps (Kielland) of normal living male baby weighing 83/16 lbs. Right oblique episiotomy. Total hours of labor $11\frac{1}{2}$. Head retracted. Spastic. Eyes swollen. Has had some cerebral edema. Prognosis good.

X-ray There is a fracture of the occipital bone posterior to the foramen magnum. Attention is called to the degree of calcification of the frontal bone and occipital bone in comparison with the calcification of the parietal bone. This is probably the cause of the occipital fracture and interfered with the moulding.

CASE 758 Mother aged twenty-six. Previous history of note shows two miscarriages at 3 and 6 months. No toxemia and no bleeding. Spontaneous rupture of membranes. Blood pressure 122/70. Position R.O.T. Pelvis normal. Delivery of 7 lbs 2 ounce male baby with medium B forceps, second degree laceration, and manual extraction of placenta. Baby in good condition. Indication for forceps were delay of second stage more than $1\frac{1}{2}$ hours due to persistent R.O.P. Total duration of labor six hours.

Baby's temperature on the fourth day rose to 106°F , then took a descending step downward until the ninth day when it reached normal. On the third day it nursed poorly and condition was not good. Eyes twitched. Very listless and during morning respiration stopped, but upon administration of oxygen it returned. Artificial respiration was given at times. Fifteen c.c. of father's blood was given intramuscularly. Vomiting started. Refused nourishment. On fifth day had convulsions with sharp cry and raising of head. Convulsions appeared every fifteen to twenty-five minutes and lasted one-half minute. As a result of refusing food, glucose and saline were given intravenously. Next day seemed unable to swallow and then for a few days the baby seemed to improve. On tenth day became cyanotic with irregular respiration. Vomiting occurred after every feeding. Died on twelfth day. Coagulation time $4\frac{1}{2}$ minutes, bleeding time $2\frac{1}{2}$ minutes.

Autopsy The scalp and subaponeurotic tissues showed some edema and petechial hemorrhages. A large subperiosteal hemorrhage was found on the right side raising the periosteum upwards so that it left a fluctuating tumor mass about six cm in diameter involving practically all of the upper and outer portions of the parietal-occipital region. On incision, the contents were found to be fluid in character, and after peeling away the periosteum, an old fracture was found extending from the sagittal line downward for a length of about $7\frac{1}{2}$ cm and extending to the posterior margin of the base. A small amount of fluid blood was found beneath the dura, covering both cerebral hemispheres. No tentorial laceration was found. Both lateral ventricles were dilated (more on the right) so that anteriorly, the cortex measured about one cm in thickness. Blood clots were found in each lateral ventricle. At one point there was a small area of necrosis, apparently from pressure. The third and fourth ventricles were extremely dilated and were united by a continuous blood clot which in the fourth ventricle extended upward and produced a pressure necrosis of the central core of the cerebellum. This clot measured about three cm in diameter. There was a large amount of unclotted blood attached to the dura at the base. The exact origin of the hemorrhage was not determined. Microscopically, the cerebellum shows pressure necrosis as a result of hemorrhage.

Diagnoses Intracerebral hemorrhage into all four ventricles, pressure necrosis of the cere-

bellum, fracture skull (birth injury), periosteal hematoma—right parietal, pulmonary edema, passive congestion of the liver, low grade peritonitis, bilateral hydroureter, right hydro-nephrosis, left pyelonephritis (hemolytic staphylococcus kidney)

CASE 4652 The mother was a primipara. There was a definite delay in the delivery as a result of a rigid cervix. The bag of waters was ruptured artificially. The cord of the baby prolapsed, so that it was necessary to make an immediate delivery. A version was done and forceps applied to the after-coming head. During the process, it was believed that the uterus had been ruptured. Baby lived thirty-six hours.

Autopsy An incision was made behind the ears extending over the occiput. The scalp was reflected forward and backward. There was a depressed fracture of the right parietal bone with two longitudinal splits in the bone. One split arose from the occipital suture line and one from the anterior temporal line. These splits were about four cm each in length. The skull was opened by cutting along the suture lines. A large tentorial laceration was found on the right side, and a smaller and less complete one on the left side. There was a small amount of unclotted blood beneath the tentorium and around the base of the brain. The choroid plexi were intensely congested. There was no evidence of intraventricular hemorrhage.

Diagnoses Depressed fracture of skull, cerebral contusion, tentorial lacerations, congenital atelectasis, pneumonia and aspiration.

CASE 6604 Mother aged twenty-six. On admission, fetal heart was heard in the right lower quadrant. Mother weighed 146 lbs. Baby was born by version and breech extraction. Baby weighed seven lbs and was living. It began as a face presentation but was converted into breech extraction. High forceps were attempted but application could not be obtained after second trial. There was considerable bleeding. Fetal heart was slow and hence breech extraction was done. Baby had rapid, labored, respiration with twitches and some spasticity. Clinical impression was cerebral hemorrhage.

Autopsy The skull was opened and the subcutaneous tissues of the scalp showed some ecchymosis over the occiput and over the area covering the anterior fontanelle. There was a small amount of hemorrhage beneath the periosteum over the posterior parietal margins. On opening the skull no evidence of hemorrhage was found over the cerebrum, although the vessels were congested. The brain was freed anteriorly by cutting the olfactory and optic nerves, reflecting the cerebrum, backward and downward, and severing the brain stem. A tentorial laceration was found in the left medial plane which was ragged. Some free hemorrhage could be seen beneath and through the tentorium. The cerebrum was opened and showed no evidence of internal hemorrhage. The lateral ventricles were not dilated and the choroid plexi were normal except for con-

gestion. The intraventricular fluid was blood tinged. The tentorium was slit and the medulla and cerebellum removed. After their removal, a fluctuating hemorrhagic mass could be seen extradurally, surrounding the posterior portion of the base of the skull. On cutting the dura, blood clots were revealed. On removal of the clots and dura, a fracture and separation of the occipital bone was found with overriding of the planum occipitale over the planum nuchale. It gave the impression of two distinct ununited portions of occipital bone. The overriding was about one cm with the upper fragment pushed inward and the lower fragment outward.

Diagnoses Cerebral contusion, tentorial laceration, fracture and overriding of the occiput, subdural hemorrhage in the occipital area, sub-tentorial hemorrhage, simple autolytic post mortem ulcers of the stomach.

The following case is reported by Dr. Abraham Tow.² Infant X was a frank breech extraction. The labor pains were ineffectual and it was necessary to grasp the foot to create traction. The head was caught by the perineum and forceps were indicated. On the second day it was noticed that the right thigh was swollen, tender, and held in abduction, while the baby moved the leg a little, it seemed practically paralyzed. The condition improved slowly without special treatment.

Injury of the Nervous System

Of the peripheral nerves, most frequently involved are the facial and others of the brachial plexus. The lumbar plexus is infrequently injured. The active cause is generally from pressure by instruments or due to compression. These may be central involvement injury to the nerve at its exit from the pons in the aqueduct of Sylvius, or as it emerges from the stylomastoid foramen. One or both sides of the face may be affected. The symptoms are inability to wrinkle the forehead, eye is partially opened, corners of the mouth droop, and when it cries, the mouth is drawn to one side. This condition requires no treatment and the outcome is generally satisfactory. Paralysis of the upper part of the plexus (Duchenne-Erb type) is fairly frequent, due to injury to the fifth or sixth cervical roots and consequently may affect the innervation of the muscles of the upper extremities, as biceps or deltoid. If other portions of the plexus are injured, then the muscles of the hands and forearm may be involved. Treatment consists of immob-

lization with plaster, later followed by massage and passive exercises. The prognosis in these cases is uncertain and the condition may persist for a long time, and even be permanent. The injury is generally due to extravasation of blood or to the nerve plexus. Spinal cord injury is always serious and generally fatal.

Injury to Internal Organs

These are mostly due to intrathoracic or intra-abdominal hemorrhage, rupture of liver, spleen or kidney. The etiological factor is either mechanical violence, pressure or asphyxia. Hemophilia and hemorrhagic diseases of the newborn must be considered. The outcome is usually fatal after a few days. If a mass is palpable, operation is possible and transfusions are essential.

Hematoma and myositis of the sternocleidomastoid muscle. This occurs soon after delivery and is characterized by a hard cartilage-like tumor formed in the muscle near its attachment. Its size varies from that of a marble to a small egg. It is easily movable upon relaxation of the muscle and is not painful. The head is inclined toward the injured muscle with the face in the opposite direction.

Etiology. occurs most frequently after breech presentations due to stretching of the muscle in the rotations of the head, resulting in a tearing of the fibers and infiltration of the blood under the muscle sheath and between the torn fibers. The prognosis is good, as the tumor generally disappears after a few weeks. Treatment is generally limited to gentle massage and passive movements of the head. If there is replacement of the muscle by fibrous tissue, a condition of congenital wry neck may result. This may be of intrauterine causation as believed by Volcker. The treatment should be conservative and surgical treatment should not be instituted for the first year.

*Hemorrhage of the adrenals.*⁵⁻⁹ These glands are very vascular and friable in their early stages and consequently bleed easily. The weight at birth is about five grams and involution occurs soon after birth. Bilateral hemorrhages are more common than unilateral and the right side

more frequently affected than the left. It may be of infectious origin followed by an inflammatory condition of the intestinal tract. Toepper reported a case in which the mother was tuberculous and Reasmen isolated *Staphylococcus aureus*, and *albus*, from the blood in pure culture in four cases.

CASE 9133. These babies were small premature twins. The period of gestation was about 6½ months. They weighed 2 lbs and 2 lbs 9 oz. They were born alive, but one died after an hour and the other lived thirty-seven hours. The first baby presented by the breech. The cord prolapsed when the membranes were ruptured and an extraction was done through a cervix not sufficiently dilated. This child lived one hour. Autopsy showed a torn tentorium and a ruptured jejunum. Version and extraction was done on the second baby. Autopsy showed a rupture of the capsule of the liver and considerable intra-abdominal hemorrhage.

The mother was admitted to the hospital complaining of abdominal pains varying from fifteen to twenty minutes during the day. Her general health was good. Has had two abortions, one accidental and one medicinal. No history of tuberculosis, syphilis, etc.

The mother was a para III, age thirty-two. She has two other healthy children. With this pregnancy she had a polyhydramnios. There were three gal of fluid (no Wassermann was taken) all of which was in the upper sac. It would have been very difficult to have reached this sac if one had decided to induce labor on account of the excessive amount of fluid. As conditions were—in labor and the cervix dilated two fingers—it was not easy to rupture the upper sac. The fact that there was one dry sac below established the diagnosis of twins.

The babies had been under a good deal of pressure. They were poorly nourished and seemed scarcely viable.

Autopsy No 1. The belly was filled with blood and a large blood clot measuring about 3 cm in diameter. The right half of the liver, superiorly, was markedly hemorrhagic and fluctuated beneath the fingers, an extensive subcapsular hemorrhage of the liver was on this side. Microscopically, the liver was like that found in a premature baby, with no evidence of syphilis. It showed some fatty infiltration and extreme congestion.

No evidence of hemorrhage was found in the subaponeurotic tissues. The skull bones were unusually well-unioned for a baby of the age at which this one was supposed to be. On opening the skull, the brain showed considerable edema and moderate congestion in the cerebral vessels, but no evidence of diffuse intracranial hemorrhage. A small blood clot was found just to the right of the right optic nerve, another small blood clot, several mm in diameter, was found in the region of the anterior portion of the pons varoli, along the

right inferior surface of the medulla. There was no evidence of tentorial laceration. In the left lateral ventricle was a blood clot measuring about four cm. in length and one-half cm. in width. The choroid plexus was markedly congested. Section of the brain revealed no hemorrhagic areas in the brain substance proper. Examination of the right ventricle showed another blood clot, about six cm. in length and one-half cm. in width.

Diagnoses Prematurity, intracerebral hemorrhage, cerebral contusion, intraventricular hemorrhage, ruptured liver and hemoperitonei.

Autopsy No 2 The abdominal wall immediately collapsed just as soon as puncture was made through the peritoneum. It was dilated with gas (bacterial). The intestines, however, remained moderately distended. The pelvis was filled with fluid of a yellowish cloudy appearance, with a few flecks of yellowish, almost biliary material with mucous content.

Stomach was distended with gas and on the inferior surface showed a few clear, small pin-head sized transparent areas which appeared, grossly, like the so-called "spasm" ulcers of the stomach. Microscopically, the stomach showed a small acute ulcer with complete digestion and destruction from the wall down to the serosa, showing an absence of the muscle layers. It was not accompanied by hemorrhage nor an inflammatory lesion, and corresponded to that of the so-called "spasm" ulcer caused by a spastic condition of the muscle and resulting autolysis of the wall by the gastric juices.

Microscopically, the liver showed marked congestion, many blood islands, and the general appearance of an immature liver. Fatty infiltration was not as marked as in the other liver. There was rather extreme subcapsular hemorrhage.

In the first portion of the jejunum was found a point of rupture. This point of rupture was about $1\frac{1}{2}$ cm. in length and a complete laceration was found with a wide separation. The contents found in the abdomen showed this yellowish bile-stained duodenal content appearance. Several small ulcerations were found in the jejunum immediately below the point of rupture. About six or seven c.c. of this mucoid material was found in the abdominal cavity.

Diagnoses Prematurity, ruptured jejunum, generalized peritonitis.

Etiology

- 1 Trauma during birth
 - 2 Asphyxia
 - 3 Eclampsia in the mother
 - 4 Stasis due to compression of the vena cava, between the liver and the vertebral column
 - 5 Thrombosis of the suprarenal vein
 - 6 Hemorrhagic diseases, infection
- The hemorrhages may be small or diffuse, involving the whole gland

Symptoms High temperature, skin rash, purpuric or petechial, rapid respiration, cyanosis, convulsions or twitchings, collapse, abdominal tumor, jaundice and metabolic changes, progressive anemia, fall in blood pressure.

Gordon³ reports a hypoglycemia, which indicates a serious prognosis. Treatment is essentially that of internal hemorrhage, blood transfusion, glucose intravenously, and operation as indicated.

Cerebral Hemorrhage

This condition is by far the most interesting and baffling of all the results of trauma in the newborn. It occurs sometimes in the cases of spontaneous delivery, but the etiological factor is generally a difficult labor, assisted with forceps or a malposition of the fetus with extraction. The danger of hemorrhage in these cases is so well-recognized that an injection of twenty c.c. of whole blood is routine in our obstetrical service. It arises from compression of the head, overriding of the cranial bones, tension or tearing of the vessels, or occlusion of the falciform sinuses. They occur between the skull and the dura, between the dura and the arachnoid and pia, between the pia and brain, into the ventricles or into the brain substance. They are divided according to etiology in (1) trauma in which there is excessive molding of the head and overriding of the sutures.

A Over the cerebrum, due to injuries of the longitudinal sinus and vessels.

B Below the tentorium. The transverse sinuses are involved.

C Into the ventricle, injury to the choroidal plexus, invariably fatal.

D Into the dura, elongation of the head with pressure of the brain against the dura and tentorium.

E Into the spinal cord.

(2) Congestion of stasis with rupture of the vein in prolonged complicated labor (Hemorrhages are petechial in character).

A Malformation

B Child oversized

C Twins

D Cord around the neck.

E Rigid cervix

F Prolonged delay between the delivery and the head and shoulders

(3) *Disease conditions* Hemorrhage of the newborn, prematurity, cerebral bleeding due to friability of the vessels, asphyxia, congenital heart, toxanemia - from causes as sepsis (syphilis doubtful)

Symptoms These may be gradual or sudden Dr Tow reports a case of a seven months premature who weighed four pounds at birth He did well until the seventh day, when he developed convulsions, became cyanotic, developed Cheyne-Stokes respiration, and died within twelve hours Autopsy showed a small hemorrhage over the medulla

A similar case occurred in our service A premature of seven months, weighed at birth 2/09 pounds The child's condition improved, increasing its weight to nearly six pounds Suddenly the baby developed similar symptoms and died Unfortunately it was impossible to obtain an autopsy, but cerebral hemorrhage was diagnosed Convulsions are characteristic, with the infant hypertonic and spastic

Twitchings may be bilateral or localized The *respiration* is irregular and rapid, often assuming a Cheyne-Stokes quality due to pressure upon the medulla The *cry* is weak and the infant difficult to arouse, often moaning constantly *Eye symptoms* are generally present, nystagmus and failure of the pupils to react to light Fixed or unequal pupils offer a bad prognosis *Facial paralysis* may be present Pallor is generally constant and suggestive of severe lesion There may or may not be a rise in temperature The intramuscular injection of blood has already been referred to, in order to increase coagulation If cerebral bleeding is suspected, then injection should be repeated Absolute quiet and rest are essential The head of the bed should be raised to reduce intracranial pressure, and external heat should be applied Five and ten per cent CO₂ and oxygen should be near the crib and used as indicated Lumbar puncture is discouraged as the spinal fluid may be tinged from a punctured vein, and the trauma incident is dangerous Sedatives are used as required

CASE 4 Mother a multipara, weight of baby at birth 12-4, did well for four days Developed restlessness with a temperature of 102, vomiting, pallor, and loose green stools

A firm tumor was found in the left splenic region, movable, and apparently painful upon pressure. Upon operation, a large hematoma was found intact, within the suprarenal capsule. Within twelve hours after its removal there was marked improvement, and later complete recovery

CASE 3378 Mother aged thirty-seven Had three abortions, one spontaneous at 3½ months, one induced at 4½ months, and one spontaneous at 6½ months There is one living child twelve years of age Had one child six years ago which lived three days

External examination showed transverse presentation. After two days and twenty hours of labor, a breach extraction was done with forceps delivery of the breech Baby was born in good condition.

On the third day baby had a convulsion like a spasm, cried considerably, and was cyanotic. Thromboplastin and paregoric were given. Baby continued to cry when touched and to have spasms with weak cry It developed a droop to left side of face. Cyanosis developed and respirations ceased Baby died seven hours after attack began

Autopsy The kidneys were exposed, appeared considerably enlarged, and were surrounded by a large mass of coagulated blood The urters were dilated, apparently patent and grossly normal The kidneys and adrenals were removed together and the hemorrhage was found to be into the adrenals, distending their capsules A picture was taken of both kidneys and adrenals and specimen was preserved by request of Drs Hawks and Cobb Microscopically, the kidneys shows prematurity of newborn with marked cloudy swelling and degeneration of the tubules and hemorrhage into the interstitial tissue in both the cortex and medulla. The suprarenal showed extensive necrosis as a result of pressure, and hemorrhage and blood clot, so that it was difficult to recognize the organ histologically

Diagnoses Hemorrhage and pressure necrosis of the suprarenals, hemorrhage, cloudy swelling, and prematurity of the kidney

CASE 4907 Mother aged twenty-nine. She was a para I, gravida I She was admitted about thirty-two days before she was due to deliver On the day of admission, there was a low forceps delivery of a female baby weighing 8 5/16 lbs The shoulders were delivered with difficulty The baby was in poor condition, requiring thirty minutes for resuscitation with the Flagg machine before breathing The baby expired approximately twenty-two hours later

Autopsy The kidneys were normal Microscopically, they were congested and showed some cloudy swelling There was a large retroperitoneal hemorrhagic mass underneath the liver which was found to be connected with the adrenal On the left side, a similar retroperitoneal hemorrhagic mass was found about four cm. in diameter It was, also, connected with the upper pole of the adrenal There

right inferior surface of the medulla. There was no evidence of tentorial laceration. In the left lateral ventricle was a blood clot measuring about four cm in length and one-half cm in width. The choroid plexus was markedly congested. Section of the brain revealed no hemorrhagic areas in the brain substance proper. Examination of the right ventricle showed another blood clot, about six cm in length and one-half cm in width.

Diagnoses Prematurity, intracerebral hemorrhage, cerebral contusion, intraventricular hemorrhage, ruptured liver and hemoperitonei

Autopsy No 2 The abdominal wall immediately collapsed just as soon as puncture was made through the peritoneum. It was dilated with gas (bacterial). The intestines, however, remained moderately distended. The pelvis was filled with fluid of a yellowish cloudy appearance, with a few flecks of yellowish, almost biliary material with mucous content.

Stomach was distended with gas and on the inferior surface showed a few clear, small pin-head sized transparent areas which appeared, grossly, like the so-called "spasm" ulcers of the stomach. Microscopically, the stomach showed a small acute ulcer with complete digestion and destruction from the wall down to the serosa, showing an absence of the muscle layers. It was not accompanied by hemorrhage nor an inflammatory lesion, and corresponded to that of the so-called "spasm" ulcer caused by a spastic condition of the muscle and resulting autolysis of the wall by the gastric juices.

Microscopically, the liver showed marked congestion, many blood islands, and the general appearance of an immature liver. Fatty infiltration was not as marked as in the other liver. There was rather extreme subcapsular hemorrhage.

In the first portion of the jejunum was found a point of rupture. This point of rupture was about $1\frac{1}{2}$ cm in length and a complete laceration was found with a wide separation. The contents found in the abdomen showed this yellowish bile-stained duodenal content appearance. Several small ulcerations were found in the jejunum immediately below the point of rupture. About six or seven c.c. of this mucoid material was found in the abdominal cavity.

Diagnoses Prematurity, ruptured jejunum, generalized peritonitis

Etiology

- 1 Trauma during birth
 - 2 Asphyxia
 - 3 Eclampsia in the mother
 - 4 Stasis due to compression of the vena cava, between the liver and the vertebral column
 - 5 Thrombosis of the suprarenal vein
 - 6 Hemorrhagic diseases, infection
- The hemorrhages may be small or diffuse, involving the whole gland

Symptoms High temperature, skin rash, purpuric or petechial, rapid respiration, cyanosis, convulsions or twitchings, collapse, abdominal tumor, jaundice and metabolic changes, progressive anemia, fall in blood pressure

Gordon⁸ reports a hypoglycemia, which indicates a serious prognosis. Treatment is essentially that of internal hemorrhage, blood transfusion, glucose intravenously, and operation as indicated.

Cerebral Hemorrhage

This condition is by far the most interesting and baffling of all the results of trauma in the newborn. It occurs sometimes in the cases of spontaneous delivery, but the etiological factor is generally a difficult labor, assisted with forceps or a malposition of the fetus with extraction. The danger of hemorrhage in these cases is so well-recognized that an injection of twenty c.c. of whole blood is routine in our obstetrical service. It arises from compression of the head, overriding of the cranial bones, tension or tearing of the vessels, or occlusion of the falxiform sinuses. They occur between the skull and the dura, between the dura and the arachnoid and pia, between the pia and brain, into the ventricles or into the brain substance. They are divided according to etiology in (1) trauma in which there is excessive molding of the head and overriding of the sutures

A. Over the cerebrum, due to injuries of the longitudinal sinus and vessels

B. Below the tentorium. The transverse sinuses are involved

C. Into the ventricle, injury to the choroid plexus, invariably fatal

D. Into the dura, elongation of the head with pressure of the brain against the dura and tentorium

E. Into the spinal cord

(2) Congestion of stasis with rupture of the vein in prolonged complicated labor. (Hemorrhages are petechial in character)

A. Malformation

B. Child oversized

C. Twins

D. Cord around the neck

E. Ridged cervix

F. Prolonged delay between the delivery and the head and shoulders

Cerebral diplegias are generally bilaterally symmetrical

2 Patients with diplegias have heads which are usually microcephalic, while with hemorrhage the heads are often enlarged

It must be concluded that the real birth injuries to the brain are caused by fractures, intracranial hemorrhages and necrosis, by laceration and by encapsulated meningeal hematoma. It is very difficult to differentiate between these lesions, and the treatment, aside from depressed fractures, is practically the same for all of the serious cerebral conditions

THE DIP IN DIPHTHERIA

A news item reporting that there have been no diphtheria deaths for six years in Brantford and Hamilton, Canada, leads James A. Tobey, Dr P H, President of the Westchester Tuberculosis and Public Health Association, to say that "credit should also be given for similar achievements in the United States" He writes to the *New York Times*

Nineteen of the largest ninety-three cities in this country had no deaths from diphtheria

in 1935, and fifteen reported no deaths in 1934 Cities in the no-diphtheria class for both of these years included Cambridge, New Bedford and Springfield, Mass., New Haven, Conn., Syracuse and Utica, N. Y., and Seattle, Wash. Yonkers, N. Y., is very nearly in this group, having no deaths from diphtheria in 1935, and rates less than one per 100,000 population since 1930

In New York City the diphtheria death rate in 1935 was only 0.9 per 100,000, whereas in 1900-04 it was fifty-eight, and in 1920-24 it was fourteen

was no other anatomical finding of importance. Microscopically, the adrenals showed extensive hemorrhage.

Diagnoses Bilateral adrenal apoplexy and terminal pneumonia.

CASE 7054 Mother aged twenty-four. Delivery by low forceps operation. Baby weighed eight lbs two ounces. Duration of labor twenty-three hours. Resuscitation of baby was necessary. Breathed in gasps for long time. Respiratory embarrassment continued. A congestion of the lungs developed, probably the result of aspiration.

Autopsy The lower portions of the trachea and branches of the bronchi were filled with thick mucus which would have contributed to the respiratory embarrassment. The lungs filled the chest. They were dark purple in color except at the extreme anterior margins which were of a cherry pink color. The lungs were fairly solid but did float. They showed extensive congestion, and some edema mixed with atelectasis. There was no evidence of a fibrinous pneumonia, although the picture was not incompatible with that of an early beginning pneumonia. Microscopically, the lungs show edema and massive congestion with extravasation of red cells into the alveoli, some atelectasis, and a beginning pneumonic process.

The muscle and valves of the heart appeared normal. The right heart was dilated. The left suprarenal was normal, the right was dilated and markedly hemorrhagic. The medulla showed a large blood clot measuring about two cm in diameter.

Diagnoses Beginning aspiration bronchopneumonia, hemorrhage into the right suprarenal, right cardiac dilation.

Cesarean Section

CASE 3860 Primipara age forty. Moderately contracted pelvis. Thirty-six hours labor with no progression—dystocia.

Baby admitted to the nursery in fair condition, weight at birth, eight pounds seven ounces, temperature range from 99–100.8°. On third day developed twitchings of the right arm and leg, rigidity of the body. This was followed by two general convulsions the next day. From that day to discharge it rested quietly and was discharged weighing eight lbs eleven ozs.

X-ray was negative for fracture of the skull.

Diagnosis Suspected intracranial hemorrhage.

CASE 5707 Mother aged thirty-six. One previous pregnancy, nine years ago, which was normal. Position LOA. Blood pressure 110/86. Baby was delivered by version and breech extraction after fifteen hours of labor. There was difficulty because of extended head and slightly deformed pelvis. Unable to apply forceps to after-coming head. Normally developed female child weighing seven pounds and eight ounces. There was difficulty in resuscitating child (Machine used with CO₂ and O₂).

Child died after 27½ hours, apparently of cerebral hemorrhage.

Autopsy There was a moderate degree of ecchymosis of the subaponeurotic tissues with very little evidence of moulding of the head. Fontanels bulged slightly. The brain was examined. A thin film of unclotted blood covered both hemispheres in the posterior two-thirds. At first this blood was believed to have been the result of puncture of the sagittal sinus on opening the skull, however, a large amount of clotted blood was found on top of the tentorium, and there were two extensive incomplete lacerations of the tentorium—one on each side. After lifting the tentorium, considerable blood was found around the cerebellum and base of the brain. There were a few small clots in the region of the optic chiasm. The ventricular fluid was found to be blood tinged but in the lateral ventricles there was no evidence of blood clot. The cerebral hemispheres showed no internal hemorrhage. Examination of the medulla showed the fourth ventricle to be filled with blood clot. It seemed possible that the hemorrhage arose from the region of the lenticular nucleus.

Diagnoses Diffuse intracranial hemorrhage, intraventricular hemorrhage (fourth), incomplete tentorial lacerations, cerebral contusion.

The results of intracranial hemorrhages are always problematical. Unquestionably, in slight cases, there are no serious aftereffects. With severe hemorrhage, extensive damage to the brain tissue may persist, and if the infant survives, be evidenced by mental retardation, monoplegic and diplegic paralysis. It is true that these conditions may also arise from a congenital defect causing an aphasia of brain tissue. Hydrocephalus may be the result of trauma or it may be due to brain defect. Of sixty-nine premature infants, who survived intracranial hemorrhage at birth, forty-two showed physical injury. Eleven or sixteen per cent showed severe damage, with spastic paralysis. Seven showed mental retardation. Seven showed moderate cerebral injury evidenced by neurologic findings. Four were subnormal. Nine or thirteen per cent slight physical injury and two mentally retarded. Six were of average intelligence and one of superior intelligence. In a study by Ford,⁵ there were evidences that the congenital diplegias were not due to hemorrhage but to congenital defects. The reasons for this are

1. Meningeal hemorrhage in at least half of the cases are unilateral and when bilateral, almost unequal upon two sides.

THE DIP IN DIPHTHERIA

A news item reporting that there have been no diphtheria deaths for six years in Brantford and Hamilton, Canada, leads James A. Tobey, Dr P.H., President of the Westchester Tuberculosis and Public Health Association, to say that "credit should also be given for similar achievements in the United States." He writes to the *New York Times*

Nineteen of the largest ninety-three cities in this country had no deaths from diphtheria

in 1935, and fifteen reported no deaths in 1934. Cities in the no-diphtheria class for both of these years included Cambridge, New Bedford and Springfield, Mass., New Haven, Conn., Syracuse and Utica, N. Y., and Seattle, Wash. Yonkers, N. Y., is very nearly in this group, having no deaths from diphtheria in 1935, and rates less than one per 100,000 population since 1930.

In New York City the diphtheria death rate in 1935 was only 0.9 per 100,000, whereas in 1900-04 it was fifty-eight, and in 1920-24 it was fourteen.

INFECTIONS OF THE SKIN DUE TO MONILIA ALBICANS

I Diagnostic value of intradermal testing with a commercial extract of *Monilia albicans*

GEORGE M LEWIS, M D, MARY E HOPPER, M S, and ROYAL M MONTGOMERY,
M D, *New York City*

*From the Skin and Cancer Unit, New York Post-Graduate Medical School and Hospital,
Columbia University*

Through the work of Kaufmann-Wolf,¹ Fabry,² Kumer,³ Hopkins,⁴ Benham,⁵ and others, a group of skin eruptions not previously considered to be related have been found to be caused by a so-called yeast, *Monilia albicans*. These eruptions are frequently localized to one area of skin but they may become of wide extent. A list of the more common disorders comprising the group of localized cutaneous *Monilia* infections includes 'erosio interdigitalis, paronychia and onychia, perlèche, intertrigo of the toes, intertrigo of the submammary, axillary, inguinal, intergluteal and umbilical regions, and some of the eczematous eruptions of the smooth skin. Infection of the oral mucosa (thrush) may also be included as another manifestation of this organism. *Monilia albicans* has been considered capable of causing a vaginal discharge. The same organism, or one closely related to it, is said to be the cause of an obstinate intestinal infection (sprue) and also an infection of the lungs and bronchi⁷ of grave import unless recognized. The incidence of infections of the hands due to *Monilia albicans* is higher in those whose hands are frequently immersed in dish water and in those who handle fruit,⁸ and is more frequent in diabetics than in individuals with a normal blood sugar. In its localized forms, cutaneous moniliasis is seldom seen in patients during the first three decades and is most common among the middle-aged. In the series of patients with *Monilia* infections, which forms the basis for part of this report, eighty-three per cent of the patients were between the ages of thirty-one and sixty, forty-seven per cent of the total were found to be between the ages of forty-one and fifty (Chart I). The more generalized eruptions, which fortunately are of rare occur-

rence, usually appear at an early age. Coincident with the cutaneous manifestations of the disease, whether of limited or of generalized extent, involvement of the buccal mucosa and tongue and the presence of *Monilia albicans* in the stool are frequently noted, symptoms referable to the gastrointestinal tract, however, are usually absent. It is interesting to recall the experience of Benham and Hopkins⁵ who attempted to isolate *Monilia albicans* from the skin and nails of one hundred normal young adults. In this, they were entirely unsuccessful. *Monilia albicans* was recovered from the alimentary tract of eighteen per cent of the same group, the organism being considered as living a saprophytic existence there. In the series of forty-two patients reported herewith, *Monilia albicans* was isolated from the mouth or feces in seven instances (16 per cent).

In studying the immunologic reactions evoked by *Monilia albicans*, it was noted that the extract of *Monilia albicans*, used in routine testing, caused numerous reactions in patients who had no clinical evidence of any of the manifestations of cutaneous moniliasis nor any history of any such infections at a prior date. The accuracy of the test as a diagnostic procedure thus became doubtful. In some instances, we also noted only a slight or even a negative response to the intracutaneous test with an extract of *Monilia albicans* in patients who had a well-defined and proven infection due to this organism. Biberstein and Epstein⁹ conducted skin tests on a large number of patients using various prepared antigens. In many instances, more vigorous reactions to the intracutaneous test were observed in patients with cutaneous moniliasis than in controls.

CHART I—Percentage incidence by age groups of 42 patients with infections of the skin caused by *Monilia albicans*

CHART II—Percentage relationship of positive reactions to the total number of injections of an extract of *Monilia albicans* in different age groups, based on 192 patients all clinically and microscopically free of all types of fungus infections

They found that occasionally seemingly healthy persons reacted to weak dilutions of the vaccine. The same investigators stated that patients with cutaneous moniliasis did not react as consistently to the injections of monilia extracts as animals with experimental *Monilia* infections

Personal Investigation

We have tabulated our results in the

testing of patients (1) with proven *Monilia albicans* infections, (2) with fungus infections caused by other fungi, and (3) with no clinical or laboratory evidence of any type of fungus infection

An analysis of our data shows that the patients from whom we isolated *Monilia albicans* were suffering from the following diseases

1 Paronychia and onychia	28
2 Tinea cruris	4
3 Intertrigo (multiple)	3
4 Intertrigo (feet alone)	2
5 Erosio interdigitalis	2
6 Eczema	2
7 Perleche	1

Thirty-five of the patients were females and seven were males. Of the thirty-five female patients, twenty-six were housewives, five were unemployed, two were domestics, one was a dress operator, and one was a saleslady. Of the seven male patients, three were waiters, two were salesmen, one was a clothes presser, and one was at school. The age incidence of these patients is considered in Chart I.

Method

Intracutaneous tests were carried out with a stock extract (*Oidiomycin*, Lederle) made from a single strain of *Monilia albicans*. The vaccine was diluted 1:150 and 0.1 cc of this mixture was the test dose. The sites of the injections were observed after forty-eight hours and again at the end of one week.

Results

The results of the tests are shown in Tables I-III. Fifty-seven per cent of the patients who had proven *Monilia* infections showed a cutaneous reaction to the test dose. In forty-three per cent, no reactions were noted. In the two series of controls (Tables II and III) the results were almost identical with one another, the number of positive reactions being forty-five and forty-six per cent respectively. It is also notable that the percentage of strong reactions is less in the series of patients with *Monilia* infections than in either of the two other groups. The rapid disappearance of the reaction, as noted from the difference in the readings at forty-eight hours and at the end

of one week, seems to be a consistent feature of the cutaneous response to the injection of the extract of *Monilia albicans*.

The reason for the high incidence of cutaneous reactions to a *Monilia* extract in individuals showing no evidence of any of the manifestations of cutaneous moniliasis and with no history of a previous outbreak, may indicate a sensitization phenomenon due to exposure to the organism (*Monilia albicans*) with the development of an infection without any clinical manifestations. There is also the possibility that *Monilia albicans* present in the gastrointestinal tract may be capable of sensitizing the skin in a manner comparable to skin sensitization to fungi imperfecti present in a focus on the interdigital webs of the feet. These and other

associated problems are being investigated at the present time. It is of interest to note the gradual increase in cutaneous sensitivity to the extract of *Monilia albicans* with increasing age in patients free of fungus infections (Chart II). Thus, between the ages of one and ten years inclusive, only sixteen per cent of the patients reacted to the test dose of the extract of *Monilia albicans* while in the decade between fifty-one and sixty years inclusive, seventy-five per cent of the patients reacted to a like test dose of the vaccine. The agreement in the results of the tests in the groups of patients in Tables II and III, showing that the presence of an infection due to a Trichophyton did not increase the incidence of reactions to the *Monilia* extract, is further evidence in favor of a difference in group sensitivity between fungi of the Trichophyton group and *Monilia albicans*.¹⁰ The majority of patients under consideration in this paper were suffering from localized forms of cutaneous moniliasis. We have also observed a patient (not reported in detail at this time) with a widespread eruption due to *Monilia albicans* in whom a reaction was absent at the test site of an intracutaneous injection of an extract of *Monilia albicans*. In another similar case, the same test evoked a strong reaction.

TABLE I—ANALYSIS OF THE CUTANEOUS REACTIONS TO OIDIOMYCIN ADMINISTERED INTRACUTANEOUSLY TO 42 PATIENTS WITH PROVEN *MONILIA ALBICANS* INFECTIONS

Reading after	Strong* reaction	Mild reaction	Total positive reaction	Negative reaction
48 hours	19%	38%	57%	43%
1 week	5%	19%	24%	76%

* In this table and in the two accompanying tables, a strong reaction indicates an area of erythema 1.5 to 2 cm or more in diameter, a mild reaction indicates an area of reaction from 0.5 to 1.5 cm in diameter, and a negative reaction indicates no response or an erythematous area smaller than 0.5 cm in diameter.

TABLE II—RESULTS OF INTRACUTANEOUS TESTING WITH OIDIOMYCIN IN 91 PATIENTS FREE OF *MONILIA ALBICANS* BUT WHO HAD OTHER FUNGUS INFECTIONS

Reading after	Strong reaction	Mild reaction	Total positive reaction	Negative reaction	Unreported
48 hours	24%	21%	45%	55%	
1 week	6%	11%	17%	66%	17%

TABLE III—RESULTS OF INTRACUTANEOUS TESTING WITH OIDIOMYCIN IN 192 PATIENTS WHO, ON CLINICAL INSPECTION AND MICROSCOPIC TESTING, WERE FREE OF ALL TYPES OF FUNGUS INFECTIONS

Reading after	Strong reaction	Mild reaction	Total positive reaction	Negative reaction
48 hours	24%	22%	46%	54%
1 week	2%	14%	16%	84%

Summary and Conclusions

1 Of forty-two patients with cutaneous moniliasis, fifty-seven per cent reacted to the intracutaneous test dose of a commercial extract of *Monilia albicans*, forty-three per cent of the same group of patients showed a negative reaction.

2 Of ninety-one patients with proven fungus infections due to fungi other than *Monilia albicans*, forty-five per cent revealed hypersensitivity to the extract of *Monilia albicans*.

3 Of one hundred and ninety-two patients who were clinically and microscopically free of all types of fungus infections, forty-six per cent reacted to the intracutaneous test with the *monilia* extract.

4 The use of the intracutaneous test with *Monilia* vaccine would appear to have limited diagnostic value. The demonstration of the organism, *Monilia*

albicans, in culture, is necessary to confirm the diagnosis of cutaneous moniliasis

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, D R P H, *New York City*

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital. The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

How the Schizophrenic Speaks

(Conclusion)

"I am living inside of myself and dying outside of myself"

"Like a horse which is frightened by a piece of paper flying in front of its eyes, and bolts, so do I when I come to a situation which I cannot grasp"

"A man gone blind is cut off through one channel of sensation. But I am cut off from the world through the closing of the channels of feelings. In some manner my thinking and feelings are separated. How I can think without getting my information from my feelings is a mystery to me"

"It's like a river that has been dammed"

"I wonder what has happened to my pity, to the fear of poverty and to all other emotions that I had. Have they all been suppressed because they were too painful? Will it be necessary to revive them in order for me to become part of humanity? My present attitude is a refusal to face facts"

"I am like a timid animal in its wild state. It's always on its guard. Its whole body is conditioned for immobility or fight as the occasion may warrant. Whether eating, drinking or sleeping it is always on the outlook for danger"

"I adopt the belligerent attitude of some animals by bristling. I do not bristle, but I have a wisecrack or sneer to substitute. I simply use the human equivalent of force, which is language"

"I am always living in a hostile environment"

"What a paradox! As long as I do not come in direct contact with people I have an exaggerated fear, awe, respect. I look up to them. But when I meet them, I despise

them. They have no significance. Their talk is unintelligible"

"Things are seen through a mirage. The world outside is dying. I am blocked in all directions. I hate the thing in myself that balks me. I am like honey looking for bees. If I had enough money to repay all those who ever aided me, including my parents and the school authorities, I would do it for the purpose of getting rid of them, but also to bribe them so that they might not blame me for my hostility to them. Why am I hostile? The world has treated me well."

(In reality he is glad to be hostile and not glad that the world has been good to him. Rationalization makes him repress his true feelings. He is also satisfied to have a wall between him and the world, but rationalization makes him desire—artificially, so to say—its disappearance. When he speaks about owing something to the world and about his wish to repay he is true to himself. But when asked how he could repay for his birth, he says "If I did repay I would still be unsatisfied because I would owe for unpayable services—evolution, civilization, life, experience, speech")

When asked suddenly "Is there really a wall between you and the world? You're mingling with people, etc"—he is taken aback and cannot answer at once. After a while he says "It is not a concrete wall, it is even worse, the separation is not even real"

"Things have lost their concreteness, objects are chimerical, sometimes the world appears like wood, other times like cotton"

"The economic depression helped me. I have opportunity to speak to people who used to be inaccessible. My fear of their power or pride is gone. They are inferior to me or at most at my level. They're licked."

"I didn't become aware of the battle raging inside of myself until a curious incident occurred. I had gone into a barber shop to shave. I sat down in the chair without noticing the barber. The barber had shaved me half way when I realized he was old and walked with a limp. No sooner did I see it than something started to boil within me. I couldn't bear to have the barber finish the shave. Showing a good deal of displeasure, I paid the man and left. On the outside I tried to understand my anger but it was useless. I couldn't go back. *I didn't want to break down the wall*, because then I wouldn't have any excuse and would be forced to acknowledge my own inconsistency."

Patients who talk that way may still be curable or amenable to some amelioration. And when improved, or when, after several conversations with the doctor, there is a tendency toward improvement, we hear them speak in the following manner:

"Yesterday for a moment people looked human and real. I mean, fear must have dropped off and the people appeared."

"I feel that the gray, flat appearance of things will change, that the wall blocking my clear, coherent thinking is breaking down. There will be a rapprochement between myself and the world. Although it may all be a midsummer night's mad dream. *The fear of people* has broken down to a remarkable degree. But I haven't even started to live or function yet."

"The veil is still there, but there is another personality in me that is fighting like hell to become free and tear aside the curtain that is *blocking off one half of the mind from the other*."

"The wall is changed into a mist."

"Never before have things appeared clearer and brighter. It's simply dazzling. I wonder if it is the crisp fine weather. But I am still reluctant to go to my office, because there I am an employee. I can go to a restaurant because there I am the patron."

"If only I could see myself through the eyes of others. It's surprising how bright the lights seem to be. Before, the world was hazy, but now, although it is not animated, although it has lost its lustre, and its gloss is gone or it is rubbed off, it is there, much clearer to me."

"It took me thirty years to discover that I have a body." (That was his age.)
"When I first came to the clinic I didn't

remember much of the past. Now I am much clearer and I remember everything."

"Everything begins to appear real. People have a distinction and significance they didn't seem to possess before."

"I wish to see people, but something doesn't let me."

In a worse, but still curable stage, we find expressions like these:

"I don't care to live, I am indifferent to my parents, I don't feel like working."

"It feels as if the earth is coming up and the sky is pressing down."

"Yesterday I was on a boat and I was afraid if something happened I couldn't get off."

"Today the whole day I feel like smashing something."

"Nothing is solid, solid things are soft."

"It feels hazy."

"I have a pain in the neck like something is clenching my head."

"I am terribly afraid in the subway. When I am in the train I want to get there quick, to arrive at once."

"I don't feel as if I am walking on this earth."

"As soon as I stepped on that sort of peninsula near the lake, in the park, I had a feeling of being closed up."

"Outdoors I feel lost."

"I am excited when meeting somebody. I feel funny in the presence of strangers. I can't talk to anyone, I am bashful and self-conscious, and yet I have a *high estimation of myself*. I am *tied up within myself*."

One patient says

"I am living with my two sisters."

"Do you like them?"

"Oh, I would feel bad if something should happen to them."

And when pressed, he confessed that he resented their presence and that he would be glad if they were dead.

In a still more advanced and more despaired condition, where a cure is doubtful, but possible, they speak thus:

"The problem I bring to you, Doctor, is that I have made an awful failure of the first twenty years of my life, and now I want to take steps to prevent a repetition of that failure."

"I feel an unreasonable self-discouragement."

"I experience a certain refusal to face things."

"I dislike my own company so much I would gladly be rid of it."

"The situation is horrible. I don't know why. I don't know why. I don't know what's the matter and I don't know what to

do I won't read for diversion, I won't join others, yet it's awful alone. What's the matter, I ask myself over and over and there is no answer"

"My inward sinking realization, daily growing, aggravates my condition and my mind runs as it chooses"

"I feel like in a daze Everything I do I do automatically It seemed to me my body is not as precious as it was As if I were two different persons I imagine my voice is not my own *Uninterested in people It's always myself, myself, myself* I have no mind of my own I can't realize it's me. I am drifting I don't care whether anybody is sick or dying I feel there are so many of me. I feel remote, distant"

"My head is somewhere else I look at my chin and nose to see if I am there I am in a different world Objects are very distant"

"I feel I can't think. The pressure in my head makes thinking very difficult."

"There is a cessation of the functioning of my mind."

"I am not master of myself I have no control over myself"

"People who are dead may be more alive to me than others who are alive, for instance Mozart" (Patient is a musician)

When patient is actually losing the grip on himself and feels the mental illness and darkness approaching it is pathetic to hear him implore for help Thus

"I don't know where I am I seem to be buried, buried from the world. It's terrible, I can't stand it I can't speak to people, I can't work As if I am walking with somebody else's legs I can't contact with people. I am separated from the world I can't go into the swing of things I can't see any friends My thoughts are buried. I walk much Why? To be away I have a feeling of unreality Oh,

it is paralyzing I buy five papers a day and throw them away without looking at them I can't break out of the shell As if there were a barrier between me and everybody else It's tough to be cut off from the rest of the world I do a lot of moaning at home I keep pent up the whole day Yes, I do have a girl, but I can't see her I'm not worthy of her Oh, doctor, help me, quick! Something is happening to me! What'll I do? Please!"

One patient, still more advanced, almost demented, most of the time in a state of confusion, can only say "I don't know" to all our questions, while his face is a blank His further way of expressing himself is to wander off without knowing where he is going One day he walked away from New York until, hungry, thirsty, and exhausted, he was found by the local police sitting in the grass, somewhere in Pennsylvania Such wanderings, when they occur in the lighter cases, as they did in a few of those quoted in this series, are also symbolic of their condition and speak volumes They went by train or motorcar from New York to California or other distant points, for no reason at all, stayed a day or two and returned This was a sort of running away from something, an escape into the unknown

In the worst disintegration the mind of such patients, now hopeless dementia praecox cases, is deteriorated or extinguished They do not speak at all—this time not because they do not care, as in earlier stages, but because they are unable—they understand nothing They pass into the night. They are living corpses

And yet, in many of these cases this extreme condition could have been prevented if treated in time and treated properly

611 W 158 St

A FREE CONVALESCENT CAMP

The New York Academy of Medicine announces that it has indorsed Dr S S Goldwater's plan for using land available on Welfare Island for a convalescent day camp for city patients unable to pay for care in convalescent homes

A tract of thirteen acres is now being cleared on the island, and until new structures in the city's hospital-building program encroach on the site, it is proposed that the land be used as a convalescent day camp, not only for island patients but for

other indigent patients recovering from acute illness

The location of the camp, which will be in eight separate units, each accommodating from fifty to seventy-five patients, will be close to the terminal of the Seventy-ninth Street ferry Arrangements will be made to issue free passes to patients residing in Manhattan, and patients residing on the other side of the East River will be expected to use the Queensboro Bridge Carfare will be paid for indigent persons

SERUM IN PNEUMONIA

That the physicians of the State may have concrete examples of different phases of anti pneumococcus serum treatment of pneumococcus pneumonia, there will appear here case reports selected from the large number received by the State Department of Health on the use of anti pneumococcus serum produced and distributed by it

In order that physicians practicing in New York City or those using effective serum from other sources may also be represented, we hope that physicians who may have had particularly significant experiences with serum will submit short reports to the Pneumonia Editor, New York State Journal of Medicine, 33 W 42 Street, New York City—Editor

Case 7—Type II Pneumonia with Bacteremia

Report from the records of the Meadowbrook Hospital by S W Doskof, MD, Hempstead

"A woman, aged forty-nine, was admitted to the hospital because of acute edema of the glottis of two days duration. The second day after admission, the temperature which had been low-grade in character suddenly rose to 104° F accompanied by a severe rigor

"Examination showed temperature 104°, pulse 130, and respirations thirty-six. There was dullness to percussion, the breath sounds were diminished and many crepitant rales were present over the entire right base

"A sputum specimen and blood culture were obtained promptly. The sputum examination failed to reveal the presence of any of the more prevalent types though pneumococci were present which were classed as "Group IV." Accordingly, only general supportive treatment was instituted

"The following day, the second day after the development of pneumonia, the blood culture was reported as indicating a pneumococcus Type II bacteremia. By this time the patient had become cyanotic and acutely ill. She was placed in an oxygen tent. Concentrated Type II antipneumococcus serum (New York State Department of Health) was immediately obtained. There was a negative history with respect to previous serum administration or symptoms of allergy, and both the skin and eye tests were negative

"The first dose of serum consisting of 40,000 units diluted in 200 cc of physiological salt solution was given intravenously at 4 00 P M. The temperature was 104°. At 9 00 P M the temperature had risen to 105.8°, the patient was quite dyspneic and acutely ill appearing. At this time another 60,000 units of serum were given in the same manner as the first dose, excepting

that 250 cc of saline solution were used. Three and one-half hours later the temperature had fallen to 103° although the cyanosis remained. Another 40,000 units were given in the same manner as the first dose. All three doses of serum were well tolerated. Three and one-half hours later, at 4 00 A M, the temperature record showed a drop to 98.8° and there was improvement in color, respirations, and general condition. The following morning the temperature rose to 101° but was not sustained and fell by evening. The convalescence was complicated only by a mild psychosis of short duration"

As with the cases previously reported, this case serves to illustrate the dramatic effect of prompt and adequate serum administration under circumstances which would otherwise almost certainly have proved fatal. The case-fatality rate for untreated bacteremic pneumococcus Type II pneumonias is between seventy-five and eighty per cent, according to the most authentic observations

In addition, this case illustrates most effectively the value of blood cultures as a check, not only upon the severity of the infection, but even more upon the typing. So-called negative or inconclusive examinations in which Group IV pneumococci are reported are not infrequently misleading since such reports usually mean merely that pneumococci of an identifiable type have not been found under the conditions of the examination. In the case here reported, it is obvious that had the blood culture not been taken, there would have been no indication for giving serum and it is quite probable that the patient would not have survived. Most authorities go so far as to advise repetition of a "negative" or Group IV sputum examination in any case which presents a typical clinical picture of pneumococcus pneumonia since it has been fairly well established that the chance of such a case being due to pneumococci of a type for which serum is available is considerably better than sixty per cent

EDITORIALS

What—and How Much?

The American Foundation Report has served to brush away some of the cobwebs that had settled about the subject of medical service through frequent repetition of certain clichés. Among the most sterile of these is "the availability of adequate medical care," for, as the Report points out, to date no one has advanced an acceptable definition of either "adequate" or "available" in this connection.

Obviously it is futile to discuss means of delivering adequate medical care until there is well-founded agreement on what constitutes adequacy in this field. It would be time and effort well spent if representative physicians and health officers got together in an attempt to arrive at a more or less precise definition.

Almost everyone would agree that adequate medical care must include the medical and surgical treatment of acute and chronic disease. It is when diagnostic aids and preventive services are reached, that ambiguity and sharp differences of opinion are encountered.

There is also need for an accurate definition of necessary medical care. In an imperfect world we are far more likely to achieve the essential than the adequate, and first efforts must be directed to securing the most necessary services for all.

As several Congressmen declared in

explanation of their attitude to a proposed Federal education law, it is unwise to create a demand for services that cannot be supplied. Tax sources are rapidly drying up under the excessive drains of recent years. With unemployment continuing in spite of business gains, there is little likelihood that we shall achieve the ideal in education, medicine or anything else in the near future. Our immediate objective must therefore be to see that essential services are available to all and that the public learns how to utilize existing facilities to the best advantage.

Still Worse

A new physiotherapy bill sponsored by Senator Feld threatens to make a bad situation worse. The present licensing provisions have been both stimulus and shield to violations of the Medical Practice Act. Under cover of their license, many registered technicians make diagnoses and treat patients independently, regardless of the law.

The logical remedy, since there are no schools in the state to train new registrants, is to abolish the licensing of lay physiotherapists altogether. Physicians and hospitals can and do train technicians according to their particular requirements. These unregistered as-

sistants are well-qualified for the tasks assigned to them and, without the incitant of a license, are content to abide by statutory restrictions

The new Feld Act takes a more nihilistic course. Since many lay technicians abuse their licenses and violate the law, Senator Feld proposes to revise the statutes to legalize their infractions. His bill permits registered physiotherapists to diagnose and treat disease without medical supervision.

Judged by the defeat of the osteopathy bill, the temper of the Legislature does not hold out much hope for the new Feld measure. An act of this kind is a direct and unwarranted attack on the standards of healing.

The medical profession, representing the best to date in medical education, is the first to admit deficiencies in its training. How much less fit are lay technicians with nothing approaching the physician's qualifications! To permit registered physiotherapists to diagnose and treat disease on their own responsibility would be virtual nullification of the Medical Practice Act.

Thanks to the Press

The medical profession desires to register its appreciation for the meritorious campaign of the *New York Post* in helping to extend the availability of antipneumococcic serum to the public of this State. Their campaign was well-conceived, and was useful news propaganda.

The *New York Times* of April 10 also deserves our sympathetic recognition. Its thoughtful editorial worthily maintains the high *Times* tradition.

The editorial attitude of the *New York Herald-Tribune* has often been both stimulating and sympathetic to organized medicine.

Medicine needs support from the intelligent portion of the public. We feel that it is an obligation on the part of all great newspapers to keep the public informed regarding various therapeutic measures and the general need for them.

The help of great newspapers to this end is welcome indeed. Too often therapeutic measures are available, but the public does not know how to get them, and the newspapers here can play a great educational role. On the other hand, legislators are often ready and willing enough to allocate money but they too do not know where it would be best expended. In the pneumonia campaign all elements cooperated to accomplish desired ends. Having the public welfare at heart, we would be remiss in our obligation did we not commend these great papers.

Pneumatology—Again?

It is somewhat deplorable that a much closer rapprochement does not exist between the departments of *Editorials* and *Correspondence* of our JOURNAL—else we would not have to irritate our readers by referring them to a previously printed letter to the JOURNAL.¹ We quote! "In the name of consistency however, if our interpretation is to convey 'Alice 'n Wonderland' impressions, we would suggest that the Surgeon remain a barber and that the Physician limit himself to the use of physic." We unquote. Now, laying aside all partiality, is this cricket? Of vastly more importance, however, from the standpoint of Organized Medicine, is it prudent to antagonize the Organized Tonsorial Artists of America by intimating, even though truthfully, that there *are* surgeons who could out-barber a barber? The question warrants judicial consideration,—even a five to four decision might help,—but would it avert a sit-down resentment of such intentions?

The letter also suggests "that the Physician limit himself to the use of physic." Well, what the—, (skip it) else does he do? According to an accepted lexicon of the language used in these United States²—"physic," the noun, mind you, conveys the meaning of the "art of healing diseases, the art

¹ N. Y. STATE JOUR. OF MED., page 675, April 1, 1937.

² Webster's Unabridged International Atlas

of medicine and of therapeutics" We know that there are other definitions, thank you, but they are in the two, three, four, et cetera class

Enough of this balderdash! We really, but honestly, and with our full heart sympathize with the plight of the Anesthetists in finding a new name for themselves Nevertheless, must their beagle-nosed dispensers of induced insensibility foist a sesquipedalian terminology upon us so that the guileless may not be gudgeoned by a guiser? Now figure this out, you name hunters!'

CURRENT COMMENT

"* * * AMONG THE MAJORITY of our doctors * * * it seems fair to say that it is sincerely felt that 'adequate medical care' should be brought into line with social and other changes by evolutionary and not by revolutionary methods It is no selfish interest in a living, certainly, but the profoundest concern for the best traditions of the profession and for the welfare of all of us which guides the doctors to somewhat this conclusion"—A friendly salute from *The New York Herald Tribune* of April 4

"* * * IT IS THE INDIGENT patient whose situation demands attention True, the pauper can always get medical services, but they are given usually at the expense of private physicians

"If the government wishes to devise ways and means of improving conditions in medicine, let it forget about schemes to give free treatment to those who can pay for it and concentrate instead on providing funds for the care of patients who need medical attention but can't pay for it after they get it. * * *"—*Medical Economics*, April 1937

"MUCH LOOSE TALK, SPECULATION, and idle guess has surrounded the status of the physician during the depression That many have borne a stupendous overload of work is within everyone's personal knowledge Those who invested in stocks, bonds and mortgages suffered the common loss But how many were rendered destitute? How many lost their professional means of support?

"Figures for 1935 as reported for the Works Progress Administration by Harry L Hopkins are '675 physicians, surgeons and dentists,' who received government aid Let the significance of these figures dawn on those who advocate sickness insurance and state medicine as offering economic security, in the comparison shown herewith of aid rendered in the same period to the other professional and technical workers as shown in the same report

Total Prof and Tech Workers	82,000
Teachers	20,000
Musicians and Music Teachers	15,000
Nurses	6,800
Engineers	6,200
Draftsmen	4,500
Actors	3,800
Clergymen and Religious Workers	3,000
Artists	2,900
Chemists, Assayists, Metallurgists	800
Reporters, Editors	1,400
Physicians, Surgeons, Dentists	675

"If state medicine and sickness insurance offer gilt-edged, ne plus ultra, double back-acting economic security as claimed, why the 20,000 teachers, 24+ % of the total? The *Journal* of the American Medical Association, Feb 20, 1937, answers 'It now appears that the security offers is a delusion'

"We have the impression that many members of the profession have heeded the siren song of the security harpies in their passage through the recent straits To such we offer this report as earwax in case they continue to be tempted"—The editor of the *Westchester Medical Bulletin* for April answers the question as to "What are the Facts" in his editorial so headed

"ONE NEVER HOPES TO PINION the wings of the fraudulent cults and quacks who, like hawks, swoop down to bring destruction in their wake. But what about the victims? No lunatic would ask a barber to make him a pair of shoes or a shoemaker to build him a wardrobe Yet a seemingly normal man or woman ignores those who are giving their lives to the study and cure of human ills, and places his or her life in the hands of those who have no more knowledge of the anatomy and pathology of the human being than does a shoemaker about wardrobe making or a barber about making shoes"—From a recent issue of *American Medicine*

"* * * THE FUNDS OF THE SOCIAL insurance organization should not be used to help out a deficit in the government budget,

because there will be no money left when the period arrives to pay for old age insurance. There has been much criticism of the unwise investment of social insurance funds in securities and real estate of doubtful cash value"—Criticism of the French social insurance law by one of the insured, brought to us by the Paris correspondent to the *JAMA*, April 10, 1937

"THE STORY OF WAITER REED, Carlos Finlay, Jesse Lazear and Aristides Agramonte and the American soldiers who permitted themselves to be inoculated by stegomyia mosquitos has been so deeply impressed on the public mind that yellow fever, once a scourge, was supposed to be conquered. Havana, which had never been free from the disease for two centuries, became a veritable health resort after Gorgas cleaned it up. So with other tropical cities. Now comes the Rockefeller Foundation with the announcement that

yellow fever is not yet under complete control * * *

"Though 'finis' cannot yet be written to the story, it would be grossly untrue to say that the scientists have failed in their struggle. The tale of Reed and his associates will always remain one of the epics of medicine—an epic which for devotion and utter selflessness has not its equal in fiction. The sober statement that comes from the Rockefeller Institute is part of that epic. It helps to restore faith in a humanity which has not been acquitting itself with honor in Abyssinia, Spain and other parts of the world. Contrast the military and economic record of greed and cruelty with what the heroes of medicine have done and consider the honest proclamation of ignorance of a menace still to be overcome—it looks as if homo sapiens were not wholly lost, as if he had his fine moments"—From an editorial in *The New York Times* of April 13

ITALY'S VICTORY OVER TROPICAL DISEASE

Dr. Aldo Castellani, to whom Mussolini and the King of Italy gave credit for keeping the Italian Army in Ethiopia in good health, has returned to resume his work at Louisiana State University, where he is Professor of Tropical Medicine.

Professor Castellani, who is an Italian Count and a member of the Italian Senate, holds numerous other posts and titles in many countries. He was knighted by King George V in 1928, is head of the Ross Institute of Tropical Medicine in England and of the Royal Institute of Tropical Medicine in Rome. He is a commander of the Italian Army and Navy Medical Corps and was High Commissioner of Sanitation in East Africa. There, with the most modern medical organization ever assembled in a colonial war, he kept the 500,000 Italian soldiers in Eritrea and Somaliland virtually free of the scourges that usually fall on expeditionary forces in tropical lands.

For the war period, from Oct. 3, 1935, to May 9, 1936, approximately 500,000 Italian troops, not counting native regiments, served in Africa. During this time only twenty-two officers and 577 men died of disease or "any other cause exclusive of battle and death by any means at the hand of the enemy."

Professor Castellani pointed out that the Italian expeditionary force lost in battle

119 officers and 980 men, a total of 1,099, and added that "in all previous wars disease deaths were at least double the number of battle deaths."

"This is the first colonial war in which the proportion has been reversed," he declared. "There may have been an element of luck, but luck cannot have been the major factor. The principal reasons were organization, and the early realization of the head of the Italian Government that medical supplies and equipment were of first importance. These supplies were in all cases given precedence over ordnance."

Professor Castellani said he had known in other wars of battalions "95 per cent hors de combat" as a result of malaria, but of the 500,000 Italian troops there were only 1,241 cases of primary malaria, 1,093 relapse cases, and 23 deaths. This low rate of infection was the result of the universal use of quinine, ten grains being given each soldier every day. There were only 453 cases of dysentery and no deaths, and no typhus whatever, due largely to the fact that most of the troops fought and marched stripped to the waist, and thus were fairly free of lice.

Professor Castellani said the health of native troops fighting with the Italian army was also "satisfactory, nearly as good as that of the white troops, but not quite."

Correspondence

[THE JOURNAL reserves the right to print correspondence to its staff in whole or in part unless marked private. All communications must carry the writer's full name and address which will be omitted on publication if desired. Anonymous letters will be disregarded.]

Thanks from Seattle

543 Stimson Building,
Seattle, Wash

To the Editor

My reason for writing you is to express my appreciation of the reference to me which appears on page 318 of the February 1 issue of your journal. It was very considerate of you to call to the attention of your readers the friendly gesture made toward me by my fellow practitioners in Seattle. It was a satisfaction to be able to enjoy the kind expressions of my many medical friends while still in this life instead of deferring it until after my departure, when a question might arise as whether or not I could appreciate the friendly post mortem sentiments which might be expressed.

It is a real satisfaction to have functioned as a doctor for half a century and still be able to navigate and participate in the functions of my fellow practitioners. After listening to the complimentary and friendly sentiments expressed on this occasion, I replied that it seemed to me I could not recall circumstances justifying all of their kind viewpoints. I assured them, however, that during the next quarter century I would endeavor to justify the complimentary attitude which they assumed toward my past performances. Perhaps I may be able to accomplish something along this line.

CLARENCE A SMITH, M D

Condemnation

929 Marcy Ave.,
Brooklyn

To the Editor

You have been accused before of pro-Nazi sympathies. Now I condemn you for it. In your April 1 issue, under your section of Travel and Resorts you prominently give the German Tourist Co. an extraordinary write up, inviting your readers to visit Naziland, using the title "Germany makes it Easier for the Tourist." In the same issue you carry an "ad" of the German Arnold Bernstein Line, the owner of which the German officials sought to arrest and to

confiscate his steamship line just because he belongs to the non-Aryan race.

As a member of the State Society I condemn your practice of antagonizing the membership who look upon the German interests as outlaws of our society, by your pro-Nazi propaganda. This sort of thing must stop otherwise it will be dragged out into the open discussion, if it has not already been done so.

You may publish this note. This is an expression of hundreds of members.

NAT KANNER, M D

NOTE Many of your advertisers are non-Aryan too

A Correction

27 E 62 St, New York City

To the Editor

On February 15, 1937, I forwarded to you material for an Editorial on "Fracture First Aid on the Highways."

Dr R H Kennedy has just called my attention to the second section of your Editorial, April 1 number, page 668, second column, paragraph 4, which states "At these highway stations, there will be trained medical personnel." This I think is a typographical error, because these stations will not be supplied with medical personnel, but with personnel trained by medical men. This may have been misinterpreted from my manuscript, page 2, line 11, "Their medical personnel has trained the custodians of these stations in first aid and its application."

I wonder if you could find some means of correcting this misstatement. The doctors of New York State have objected to first aid being given by attendants trained in first aid rather than by medical men. It is obvious that the stations cannot be manned by medical men nor that medical men will be the first to handle these cases.

DOUGLAS GORDON, M D

April 13, 1937

NOTE We gladly publish the above, which is self-explanatory and will also correct any misconception caused by our editorial — Editor

Symposium "The Blood"

1 "MECHANISMS OF HEMOGLOBIN PRODUCTION AS INFLUENCED BY VARIOUS FACTORS UNDER EXPERIMENTAL CONDITIONS"

George H Whipple, M D, Dean of Rochester School of Medicine and Dentistry, *Rochester*

2 "ERYTHROCYTE FORMATION, WITH ESPECIAL REFERENCE TO PATHOLOGICAL VARIATIONS IN ANEMIA"

William B Castle, M D, Associate Professor of Medicine and Chairman of Medical Dept, Harvard Medical School, *Boston, Mass* (invited guest)

3 "THE LEUKOCYTES, THEIR BEHAVIOR IN VARIOUS PATHOLOGICAL STATES"

Cyrus C Sturgis, M D, Professor of Medicine, University of Michigan, Director of Thomas Henry Simpson Memorial Institute, *Ann Arbor, Mich* (invited guest)

THE SECTIONS

[All papers read before the Society by members become the property of the Society. The original copy of each paper shall be left with the Secretary of the Section. Discussers should have their remarks typed and hand them to the Secretary if they wish them published. Section meetings shall begin promptly at the hour specified.]

SECTION ON MEDICINE

Chairman
Secretary

Charles D Post, M D, Syracuse
Ralph H Boots, M D, New York

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

1 "THE NERVOUS FACTORS IN PEPTIC ULCER"

Asher Winkelstein, M D, *New York*

Discussion opened by H Walden Retan, M D, *Syracuse*, and Abraham H Aaron, M D, *Buffalo*

2 "MODE OF DEATH AND ANALYSIS OF FATAL CASES IN CORONARY ARTERY THROMBOSIS"

Arthur M Master, M D, *New York*
Harry L Jaffe, M D, *New York*
Simon Dack, M D, *New York*

Discussion opened by Clayton W Greene, M D, *Buffalo*, and Carl S Benson, M D, *Binghamton*

3 "USES OF PROTAMINE ZINC INSULIN"

W R Campbell, M D, *Toronto, Ontario* (invited guest)

Discussion opened by William A Groat,

M.D., *Syracuse*, William W Hall, M.D., *Watertown*, Charles B Gibbs, M.D., *Rochester*, and Harry G Jacobi, M.D., *New York*

Wednesday, May 26—10 00 A M

1 "GLOMUS TUMOR"

Samuel J Stabins, M.D., *Rochester*

Discussion opened by Carroll J Roberts, M.D., *Buffalo*

2 "TREATMENT OF POLYCYTHEMIA VERA"

Kenneth R McAlpin, M.D., *New York* Catherine Edsall Smith, B.S., *New York* (invited guest)

Discussion opened by William B Castle, M.D., *Boston, Mass* (invited guest)

3 "TREATMENT OF NEPHRITIC HYPERTENSION WITH A DIURETIC AGENT OBTAINED FROM THE ANIMAL KIDNEY"

Benjamin Jablons, M.D., *New York*

Discussion opened by Herman O Mosenenthal, M.D., *New York*, and Frederick M Allen, M.D., *New York*

4 "THE PROBLEM OF PERIPHERAL VASCULAR DISEASE"

Arthur N Curtiss, M.D., *Syracuse*

Discussion opened by J Herbert Conway, M.D., *New York*, and Herman E. Pearse, Jr., M.D., *Rochester*

SECTION ON SURGERY

Chairman
Secretary

Thomas M Brennan M.D., *Brooklyn*
Benjamin W Seaman, M.D., *Hempstead*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

1 "NEWER CONCEPTIONS OF THE PATHOGENESIS AND MANAGEMENT OF TUBERCULOUS EMPYEMATA"

Pol N Coryllos, M.D., *New York*

Discussion opened by Edward S Welles, M.D., *Saranac Lake*, and Leon J Leahy, M.D., *Buffalo*

2 "SURGICAL ASPECT OF COLO-ILEITIS AND NON-SPECIFIC ULCERATIVE COLITIS"

Albert Ashton Berg, M.D., *New York*

Discussion opened by John C M Brust, M.D., *Syracuse*, and Henry W Cave, M.D., *New York*

3 "IMPORTANT PROBLEMS IN THE DIAGNOSIS AND MANAGEMENT OF THYROID DISEASE"

George E Beilby, M.D., *Albany*

Discussion opened by Raymond P Sullivan, M.D., *New York*, and Arthur S McQuillan, M.D., *New York*

Wednesday, May 26—10 00 A M

1 "THE PRESENT STATUS OF THE

TREATMENT OF MAMMARY CANCER BY SURGERY AND IRRADIATION"

Frank E Adair, M.D., *New York*

Discussion opened by Francis W Currin, M.D., *Brooklyn*, William H Wehr, M.D., *Buffalo*, and Donald S Childs, M.D., *Syracuse*

2 "CANCER OF THE RECTUM AND RECTO-SIGMOID JUNCTION"

Jerome M Lynch M.D., *New York*

Discussion opened by Descum C McKenney, M.D., *Buffalo*, Albert G Swift, M.D., *Syracuse*, and Percival K. Menzies, M.D., *Syracuse*

3 "INJECTION TREATMENT OF HERNIA"

Bradley L Coley, M.D., *New York*

Discussion opened by Howard L Prince, M.D., *Rochester*, and Chas Gordon Heyd, M.D., *New York*

4 "SURGICAL TREATMENT OF CARCINOMA OF THE OESOPHAGUS"

John H Garlock, M.D., *New York*

Discussion opened by Robert F Barber, M.D., *Brooklyn*, and W J Merle Scott, M.D., *Rochester*

SECTION ON OBSTETRICS AND GYNECOLOGY

Chairman
Secretary

Nelson B Sackett, M.D., *New York*
Goode R Cheatham, M.D., *Endicott*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

1 "AUTO BLOOD TRANSFUSION IN ECTOPIC PREGNANCY"

Arthur J Wallingford, M.D., *Albany*

Discussion opened by Lillian K. P Farrar, M.D., *New York*

2 "INCONTINENCE OF URINE IN THE FEMALE SPHINCTER MECHANISM AND CONTROL LOSS AND RESTORATION"

William T Kennedy, M D, *New York*

Discussion opened by Henry Dawson Furniss, M D, *New York*

3 "ROENIGLN PELVIMETRY A CLINICAL STUDY"

Claude E Heaton, M D, *New York*

Discussion opened by Walter W Fray, M D, *Rochester*

Wednesday May 26—10 00 A M

1 "ETIOLOGICAL FACTORS IN HUMAN

FEMALE STERILITY"

Charles P Sheldon, M D, *Albany*

Discussion opened by Karl M Wilson, M D, *Rochester*

2 "VESICO-VAGINAL FISTULAE THEIR CAUSE AND CURE"

Noiman F Miller M D, *Ann Arbor, Mich* (invited guest)

Discussion opened by Nathan P Sears, M D, *Syracuse*

3 "SOME UNUSUAL COMPLICATIONS ASSOCIATED WITH ABRUPTIO PLACENTAE"

Edward C Hughes, M D, *Syracuse*, and Albert W Van Ness, M D, *Syracuse*

Discussion opened by Shirley R. Snow, Jr, M D, *Rochester*

SECTION ON NEUROLOGY AND PSYCHIATRY

Chairman

Secretary

Lloyd H Ziegler, M D, *Albany*

Charles A McKendree, M D, *New York*

Place of Meeting Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

1 "MELANOSIS OF THE MENINGES REPORT OF CASE WITH NECROPSY FINDINGS"

Isaac Shapiro, M D, *Schenectady*

Discussion opened by Victor C Jacobsen M D, *Troy*

2 "EXPERIENCES OF A PSYCHIATRIST IN THE POLICE COURT"

Richard C A Jaenike, M D, *Rochester*

Discussion opened by R Montfort Schley, M D, *Buffalo*

3 "LESIONS OF THE OPTIC CHIASM FOLLOWING HEAD TRAUMATA A REPORT OF CASES"

Eldridge H Campbell, Jr, M D, *Albany*

Discussion opened by Paul H Garvey, M D, *Rochester*

4 "PUBLIC HEALTH ASPECTS OF MENTAL HYGIENE"

Frederick W Parsons, M D, *Albany*

Discussion opened by Edward S Godfrey, Jr, M D, *Albany*

Wednesday, May 26—10 00 A M

1 THE CHAIRMAN'S ADDRESS "TEACHING NEUROLOGY TO UNDERGRADUATE MEDICAL STUDENTS"

Lloyd H Ziegler, M D, *Albany*

2 "A CASE OF HEMIBALLISMUS MOTION PICTURE PRESENTATION AND NECROPSY FINDINGS"

Hugh S Gregory, M D, *Binghamton*

Discussion opened by Edward A Sharp, M D, *Buffalo*

3 "PSYCHIC STATES ASSOCIATED WITH HYPERGLYCEMIA"

Eugene N Boudreau, M D, *Syracuse*

Discussion opened by Albert G Odell, M D, *Clifton Springs*, and George E. Daniels, M D, *New York*

4 "FURTHER OBSERVATIONS ON HYPOLYCEMIC SHOCK THERAPY"

Bernard Glueck, M D, *Ossining-on Hudson*

Discussion opened by Joseph Wortis, M D, *New York*

SECTION ON PEDIATRICS

Chairman

Vice-Chairman

Secretary

Frank J Williams, M D, *Albany*

John Dorsey Craig, M D, *New York*

Paul W Beaven, M D, *Rochester*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

1 "PNEUMONIA IN STILLBORN AND NEWBORN INFANTS"

Margaret Warwick, M D, *Buffalo*

Discussion opened by Douglas P Arnold, M D, *Buffalo*

2 "CRYPTORCHIDISM"

James B Hamilton, Ph D, *Albany*
(invited guest)

Discussion opened by John E. Heslin, M D, *Albany*

3 "PERSISTENT VOMITING IN EARLY LIFE, WITH SPECIAL REFERENCE TO OBSTRUCTIONS OF THE GASTROINTESTINAL TRACT"

Samuel W Clausen, M D, *Rochester*

Discussion opened by John J Morton, Jr, M D., *Rochester*

Wednesday, May 26—10 00 A M

1 "A CONSIDERATION OF ACCIDENTAL

SMALLPOX VACCINATION AND ECZEMA VACCINATUM"

Gaylord W Graves, M D, *New York*

Discussion opened by Donald D Posson, M D, *Rochester*

2 "IRON DEFICIENCY ANEMIA IN INFANTS AND CHILDREN"

Louis K. Diamond M D, *Boston*,
Mass (invited guest)

Discussion opened by William L Bradford, M D, *Rochester*

3 "IS VITAMIN C DEFICIENCY A FACTOR IN RHEUMATIC FEVER"

Albert D Kaiser, M D, *Rochester*

Discussion opened by Marshall C Pease, M D, *New York*

4 "CONGENITAL SYPHILIS, A THREE YEAR SURVEY IN SYRACUSE"

C George Murdock, M D, *Syracuse*

Discussion opened by Wildridge C Thompson, M D, *State Department of Health, Albany*
(invited guest)

SECTION ON DERMATOLOGY AND SYPHILOLOGY

Chairman
Secretary

Albert R McFarland, M D, *Rochester*

Harry C Saunders, M D, *New York*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

1 PRELIMINARY REPORT OF THE WORKMEN'S COMPENSATION ADVISORY COMMITTEE ON INDUSTRIAL DERMATOSES

Herman Sharlit, M D, Chairman,
New York

2 "MOAIC WART AN UNUSUAL TYPE OF PLANTAR WART"

Andrew H Montgomery, M D, *New York*,
and Royal M Montgomery, M D,
New York

Discussion opened by Mark Heiman, M D,
Syracuse

3 "INFECTIONS OF THE SKIN DUE TO MONILIA ALBICANS DIAGNOSTIC, IMMUNOLOGIC AND THERAPEUTIC CONSIDERATIONS"

George M Lewis, M D, *New York*,
and Mary E Hopper, M S, *New York*
(invited guest)

Discussion opened by Herbert H Bauckus,
M D., *Buffalo*

4 "HYDROA AESTIVALE IN A CASE OF CONGENITAL PORPHYRIA WITH RED BROWN TEETH AND HIRSUTIES"

Clarence H Peachey, M D, *Rochester*,
and William H Strain, Ph D (invited
guest)

Discussion opened by Edward R. Maloney,
M D, *New York*

Wednesday, May 26—10 00 A M

1 "DERMATITIS DUE TO BISMUTH COMPOUNDS, ACCOMPANIED BY CUTANEOUS SENSITIVITY TO THE ARSENOBENZOLS"

James W Jordan, M D, *Buffalo*, and
Harold L Walker, M D, *Buffalo*

Discussion opened by Paul Gross, M D,
New York

2 "SKIN LESIONS OBSERVED IN GONOCOCCAL INFECTIONS WITH A REPORT OF A CASE."

Oscar L Levin, M D, *New York*
Seymour H Silvers M D, *Brooklyn*

Discussion opened by Harry Day Parkhurst, M D, *Utica*

3 "UNUSUAL MANIFESTATIONS OF THE SKELETAL SYSTEM IN SECONDARY SYPHILIS"

Ben A Newman, M D, *New York*,
and Harry C Saunders, M D, *New York*

Discussion opened by Richard L Saunders,
M D, *Buffalo*

4 "THE PRESENT STATUS OF LYMPHO-
GRANULOMA VENEREUM"

David Bloom, M D, *New York*

Discussion opened by Rudolph Ruedemann,
Jr, M D, *Albany*

SECTION ON OPHTHALMOLOGY AND OTOLARYNGOLOGY

Chairman

Secretary

Walter S Atkinson, M D, *Watertown*

Marvin F Jones, M D, *New York*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—9 00 A M

Instruction Hour 9 00 A M to 10 00 A M

"THE RECIPROCAL DEPENDENCE OF
REFRACTION AND MUSCLE TESTS"

James W White, M D, *New York*

1 "THE SURGICAL TREATMENT OF
STRABISMUS"

John H Dunnington, M D, *New York*

Discussion opened by John F Gipner, M D,
Rochester, and Frank M Sulzman, M D,
Troy

2 "THE MANAGEMENT OF INTRAOCULAR
FOREIGN BODIES"

David F Gillette, M D, *Syracuse*

Discussion opened by Algernon B Reese,
M D, *New York*, and Morris H Newton,
M D, *Little Falls*

3 "INTRACAPSULAR EXTRACTION OF
CATARACT WITH IRIDOTOMY"

Franklin Bracken, M D, *New York*

Discussion opened by Thurber LeWin, M D,
Buffalo, and Lawrence E Henderson, M D,
Watertown

Wednesday, May 26—9 00 A M

Instruction Hour 9 00 A M to 10 00 A M

"HISTOPATHOLOGY OF EAR, NOSE AND
THROAT"

Andrew A Eggston, M D, *New York*

1 "DIFFERENTIATION BETWEEN RECED-
ING AND PROGRESSING CASES OF
PETROSITIS"

Ralph Almour, M D, *New York*

Discussion opened by Melvin J Stearns,
M D, *Ogdensburg*

2 "SOME OBSERVATIONS OF THE EFFECT
OF MALE HORMONE UPON THE NASAL
MUCOSA OF MAN AND MONKEY"

Harry K Tebbutt, M D, *Albany*

Discussion opened by D'Arcy McGregor,
M D, *Buffalo*, and Leonard W Jones, M D,
Rochester

3 "ACUTE PHARYNGEAL STENOSIS"

Roy S Moore, M D, *Syracuse*

Discussion opened by Austin G Morris,
M D, *Rochester*, and Clayton M Brown, M D,
Buffalo

SECTION ON PUBLIC HEALTH, HYGIENE AND SANITATION

Chairman

Secretary

Thomas P Farmer, M D, *Syracuse*

Burke Diefendorf, M D, *Ticonderoga*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

1 "NEGLECTED HEALTH FACTORS IN
OUR PUBLIC SCHOOLS"

William Rosenson, M D, *New York*

Discussion opened by Dean F Smiley, M D,
Ithaca

2 "THE IMPORTANCE OF CERTAIN AGE
GROUPS IN TUBERCULOSIS CASE FIND-
ING AMONG CHILDREN"

Marion F Loew, M D, *New York*

3 "COMPARATIVE VALUES OF THE

TUBERCULIN TEST OF SCHOOL CHILD-
REN"

George W Weber, M D, *Albany*, (in-
vited guest)

Discussion opened by George C Ruhland,
M D, *Washington, D C* (invited guest) and
William J Ryan, M D, *Pomona*

4 "RELATIONSHIP OF THE PHYSICIAN
AND HEALTH OFFICER TO THE CHILD
HEALTH PROGRAM"

John Dorsey Craig, M D, *New York*

Discussion opened by Edward J Wynkoop,
M D, *Syracuse*

Wednesday, May 26—10 00 A M

1 "VENEREAL DISEASE CONTROL PROGRAM IN NEW YORK CITY"

John L Rice, M D, *New York*

Discussion opened by Edward S Godfrey, Jr, M D, *Albany*, David J Kaliski, M D, *New York*, and William A Brumfield, Jr, M D, *Albany*

2 "THE COMPLEMENT FIXATION TEST AS A DIAGNOSTIC AID IN THE CONTROL OF GONORRHEA"

Emily D Barringer, M D, *New York*

3 "THE CULTURE METHOD FOR THE DIAGNOSIS OF GONOCOCCAL INFECTION MOTION PICTURE DEMONSTRATION IN COLOR"

Charles M Carpenter, M D, *Rochester*

Discussion opened by Orren D Chapman, M D, *Syracuse*

4 "INFLUENZA"

Thomas Francis, Jr, M D, *New York*

Discussion opened by Augustus B Wadsworth, M D, *Albany*, and Russell L Cecil, M D, *New York*

SECTION ON UROLOGY

Chairman

Vice-Chairman

Secretary

Fedor L Senger, M D, *Brooklyn*

Albert M Crance, M D, *Geneva*

Francis N Kimball, M D, *New York*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

1 "PROSTATIC DISEASE, DETERMINATION OF THE METHOD OF TREATMENT"

Roy B Henline, M D, *New York*

Discussion opened by J Sturdivant Read, M D, *Brooklyn*

2 "THE ACCURATE TREATMENT OF BLADDER DISEASES"

Thomas J Kirwin, M D, *New York*

Discussion opened by John H. Powers, M D, *Cooperstown*

3 "UROGENITAL TUBERCULOSIS IN INFANTS AND CHILDREN"

Meredith F Campbell, M D, *New York*

Discussion opened by Paul M Butterfield, M D, *New York*

Wednesday, May 26—10 00 A M

1 "THE CURE OF HYDROCELE BY INJECTION"

Louis H Baretz, M D, *Brooklyn*

Discussion opened by Allan L. Parlow, M D, *Rochester*

2 "THE MORPHOLOGY OF THE ABNORMAL NEPHRON"

Jean Oliver, M D, *Brooklyn* (invited guest)

Discussion opened by Russell S Ferguson, M D, *New York*

3 "REMOTE PRIMARY MANIFESTATIONS IN URINARY TRACT MALIGNANCY"

Ernest M Watson, M D, *Buffalo*, and Carl J Leutenegger, M D, *Buffalo*

Discussion opened by E Earle Shouldice, M D, *Toronto, Canada* (invited guest)

SECTION ON RADIOLOGY

Chairman

Vice-Chairman

Secretary

James M Flynn, M D, *Rochester*

Clifford R Orr, M D, *Buffalo*

William P Howard, M D, *Albany*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

1 "DUODENAL STASIS, ITS DIAGNOSIS AND TREATMENT"

John M Barnes, M D, *Buffalo*, and Daniel E Stedem, M D, *Kenmore*

2 "THE MANAGEMENT OF MEDIASTINAL HODGKINS DISEASE"

Ross Golden, M D, *New York*, and Haig H Kasabach, M D, *New York*

3 "MALIGNANT AND BENIGN LESIONS OF THE SMALL BOWEL"

William E Howes, M D, *Brooklyn*

4 "THE ROENTGEN KYMOGRAPHIC EXAMINATION OF THE HEART"

I Seth Hirsch M D, *New York*

- 5 "THE DIAGNOSIS AND THE TREATMENT OF BENIGN AND MALIGNANT LESIONS OF THE BREAST"

Louis C Kress, M D, *Buffalo*

Wednesday, May 26—10 00 A M

- 1 "THE ROENTGEN FINDINGS OF RENAL TUBERCULOSIS"

Henry K Taylor, M D, *New York*,
and Leonard P Wershush, M D, *New York*

- 2 "A NEW METHOD OF ROENTGEN DOSAGE AND ITS INDICATIONS"

Ralph E Herendeen, M D, *New York*

- 3 "THE CORRELATION OF ROENTGENOLOGICAL AND PATHOLOGICAL FINDINGS IN ORGANIC GASTRIC LESIONS"

Lewis Gregory Cole, M D, *New York*

- 4 "IRRADIATION FOR STIMULATING OR SUPPRESSING MENSTRUAL FUNCTION"

Ira I Kaplan, M D, *New York*

- 5 "RADIOLOGY AND THE RADIOLOGIST OF THE FUTURE"

Frederic E Elliott, M D, *Brooklyn*

SECTION ON INDUSTRIAL MEDICINE AND SURGERY

Chairman
Secretary

Cassius H Watson, M D, *New York*
Frederick S Wetherell, M D, *Syracuse*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

- 1 "THE THYROID GLAND FROM THE STANDPOINT OF PREEMPLOYMENT APPRAISAL OF THE APPLICANT FOR WORK"

Emil Goetsch, M D, *Brooklyn*

Discussion opened by William S McCann, M D, *Rochester*

- 2 "THE TREATMENT OF THE INDUSTRIAL BURN"

John J Wittmer, M D, *Brooklyn*

Discussion opened by Dan Mellen, M D, *Rome*

- 3 "THE EXTENT OF PLUMBISM IN THE COMMUNITY, PARTICULARLY FROM THE STANDPOINT OF THE INDUSTRIAL WORKER"

Irving Gray, M D, *Brooklyn*

Discussion opened by Robert K. Brewer, M D, *Syracuse*

Wednesday, May 26—10 00 A M

- 1 "BED REST FOR BACK INJURIES"

Edward T Wentworth, M D, *Rochester*

Discussion opened by Richard S Farr, M D, *Syracuse*

- 2 "THE SUPERVISION BY INDUSTRY OF COMPENSATION CASES"

John J Moorhead, M D, *New York*

Discussion opened by Ralph J McMahon, M D, *Endicott*

- 3 "THE PRACTICAL BRIEF PHYSICAL APPRAISAL OF THE PROSPECTIVE OUTSIDE PLANT EMPLOYEE"

Edward S McSweeney, M D, *New York*

Discussion opened by Benjamin J Slater, M D, *Rochester*

SESSION ON REGIONAL AND GENERAL ANESTHESIA

Chairman
Secretary

J Lewis Amster, M D, *New York*
S LeRoy Sahler, M D, *Rochester*

Place of Meeting, Rochester Chamber of Commerce

Tuesday, May 25—10 00 A M

- 1 "SPINAL ANESTHESIA, ITS USES AND ITS LIMITATIONS"

Orville C King, M D, *Philadelphia*,

Pa (invited guest)

Discussion opened by Harry Koster, M D, *Brooklyn*, and Robert B Hammond, M D, *White Plains*

- 2 "THE ORGANIZATION OF AN ANESTHETIC DEPARTMENT"

Emery A Rovenstine, M D, *New York*

Discussion opened by Charles J Wells, M D, *Syracuse*, and Paul M Wood, M D, *New York*

3 "ANESTHETIC MANAGEMENT OF SPECIFIC THYROID PROBLEMS"

Philip D Woodbridge, M D, *Boston*, *Mass* (invited guest)

Discussion opened by Donald Guthrie, M.D., *Sayre, Pa.*, (invited guest) and Hippolyte M Wertheim, M D, *New York*

4 "ANALGESIA AND ANESTHESIA IN OBSTETRICS"

Wesley Bourne, M D, *Montreal, Canada* (invited guest)

Discussion opened by James K Quigley, M D, *Rochester*

SESSION ON PHYSICAL THERAPY

Chairman
Secretary

Madge C L McGuinness, M D, *New York*
Harold J Harris, M D, *Westport*

Place of Meeting, Rochester Chamber of Commerce

Wednesday, May 26—10 00 A M

1 "THE INVESTIGATION OF APPARATUS BY THE COUNCIL ON PHYSICAL THERAPY"

Howard A Carter, M D, Secretary Council on Physical Therapy, A M A *Chicago, Ill* (invited guest)

2 "GENERAL ASPECTS AND NEW APPLICATIONS OF ELECTROPHORESIS IN PHYSICAL THERAPY"

Karl Harpuder, M D, *New York*
Discussion opened by Jacob J Levy, M.D., *Syracuse*

3 "PHYSICAL THERAPY IN RELATION TO INTERNAL MEDICINE"

Jacob Gutman, M D, *Brooklyn*

Discussion opened by Harold J Harris, M D, *Westport*, and Virginia S Tannenbaum, *Buffalo*

4 "RELIEF OF PAIN BY PHYSICAL MEASURES"

Richard Kovacs, M D, *New York*

Discussion opened by Peter Irving, M D, *New York*

5 "THE VALUE OF PHYSICAL THERAPY IN THE REHABILITATION OF SOME COMMON HAND CONDITIONS"

George G Martin, M D, *Buffalo*

Discussion opened by Dwight V Needham, M D, *Syracuse*, and Alfred L C Ulrich, M D, *Buffalo*

Scientific Exhibit

Place of Meeting, Rochester Chamber of Commerce

Dr Charles M Carpenter in Association with Dr Ruth A Boak, Alice D Leahy, Hester A Austin, Lucille Hawley and Harold F Wengatz, University of Rochester—School of Medicine and Dentistry

BACTERIOLOGICAL, THERMAL DEATH TIME AND SEROLOGICAL METHODS FOR THE DIAGNOSIS OF GONOCOCCAL INFECTIONS

Description Exhibit of media and supplies necessary for the routine bacteriological diagnosis of gonococcal infection by the cultural method. Smears properly stained for the gonococcus will be shown. Charts depicting the superiority of the cultural method over the smear method will be displayed.

Determination of Thermal Death Time of gonococcus at fever temperature

A special water bath used for the determination of the thermal death time of the gonococcus at 41.5°C and a method for carrying out the procedure will be shown.

A complement fixation test for the examination of a patient's serum for evidence of gonococcal infection will be demonstrated, also agglutination tests for classifying strains of the gonococcus.

Dr Stafford L Warren, University of Rochester, School of Medicine and Dentistry

THE EFFECT OF ARTIFICIAL FEVER

Description Artificial fever by the radiant

energy Characteristic temperature, pulse and respiration charts for various treatment periods Microphone and amplifier for magnifying heart sounds one million times their original volume Sound records of characteristic heart sounds during fever treatment and murmurs of various types of valvular disease

Thermal death time theory for gonococcus applied to treatment of gonococcal infections Tests on cultures from patients show length of fever treatment at 41.5°C necessary to kill the particular strain to be usually 12 to 18 hours, maybe as long as 30 hours

The combined effect of fever and roentgen radiation has a much greater killing power for rabbit epithelioma *in vivo* than either one alone Various dosage combinations will be illustrated, and microscopic and gross specimens shown

Tumor transplants of rabbit epithelioma were placed under windows made in the rabbit's ear Development of the capillary blood supply around the growing tumor transplant is shown in a display of photographs, many in natural color

Dr C A Elden, University of Rochester, School of Medicine and Dentistry

GYNECOLOGICAL EXHIBIT

Description Charts showing the results of progestin therapy in certain gynecological conditions

Dr Karl M Wilson, University of Rochester, School of Medicine and Dentistry

OBSTETRICAL EXHIBIT

Description A series of specimens and drawings illustrating some unusual obstetrical and gynecological conditions

Drs Leslie Sandholzer and Ralph Tittsler, University of Rochester, School of Medicine and Dentistry

BACTERIOPHAGY

Description Pictures illustrating bacteriophage action in various media and on various organisms Charts illustrating some of the properties of the lytic principle and its use in various infections Cultures and exhibits showing the action of bacteriophage and other lytic agents

Drs W O Fenn and J B Hursh, University of Rochester—School of Medicine and Dentistry

AN ELECTRICAL METHOD FOR RECORDING EYE MOVEMENTS

Description Electrodes are placed on the temples lateral to the eyes Potential dif-

ferences produced by movements of the eyes are recorded on a string galvanometer, the potential being proportional to the extent of the movements In this way movements of the eyes can be followed when the eyes are closed

Drs Nolan L Kaltreider and William S McCann, University of Rochester—School of Medicine and Dentistry

PULMONARY CAPACITY IN VARIOUS DISEASES

Description Summary charts of the total pulmonary capacity and its subdivisions of cases of obstructive emphysema, pulmonary fibrosis, bronchial asthma, thoracoplasty and artificial pneumothorax during lobar pneumonia are shown Various components of the pulmonary capacity are correlated to the degree of dyspnea Charts demonstrating the respiratory response during exercise in pulmonary fibrosis and emphysema are presented.

Dr William Bradford and Elizabeth Slavin, University of Rochester, School of Medicine and Dentistry

THE PHAGOCYTIC POWER OF THE BLOOD AND WHOOPING COUGH

Description The effect of the administration of immune blood upon phagocytosis of *H. pertussis* is shown by microscopic preparations Charts further illustrate the results of experimental studies Modification of the cough plate as used in this laboratory is shown as well as cultures of Phase I and of Phase IV organisms

Dr D J Stephens and Estelle E Hawley, Ph D, University of Rochester, School of Medicine and Dentistry

VITAMIN C STUDIES

Description Demonstration of various vitamin C preparations for oral and parenteral use and the vitamin C values of various foods Charts and tables will be shown demonstrating factors which influence the urinary excretion of vitamin C Studies of vitamin C saturation and excretion in normal subjects, in patients with scurvy and in patients with mild degrees of vitamin C deficiency will be shown

Dr R. Plato Schwartz and Associates, University of Rochester, School of Medicine and Dentistry

MECHANISM OF HUMAN GAIT

Description The clinical significance of recording human gait before and after treatment of causes for limitations in the ability to walk.

A robot which reproduces, in slow motion, the movements of the pelvis and right lower extremity in walking at the average rate of 18 steps per second

Drs William P Van Wagenen and Rowland Bellows, University of Rochester, School of Medicine and Dentistry

DISTURBANCES OF WATER METABOLISM ASSOCIATED WITH HYPOTHALMIC LESIONS, EXPERIMENTAL AND CLINICAL

Description Series of charts showing disturbances of water intake and output associated with pituitary tissues, congenital cysts of the hypophysis, tremors of the third ventricle, encephalitis affecting the third ventricles and experimental punctures of the floor of the third ventricle

Dr William R. J Wallace, University of Rochester, School of Medicine and Dentistry

FRACTURED JAWS

Description Charts, photographs and x-ray studies showing the methods and results in the management of jaw fractures

Drs George W Corner and Willard M Allen, University of Rochester, School of Medicine and Dentistry

THE HORMONE OF THE CORPUS LUTEUM

Description Drawings, photographs, graphs and specimens

Dr Edmund S Nasset, University of Rochester, School of Medicine and Dentistry

"A HUMORAL CONTROL OF INTESTINAL SECRETION"

Description Charts and graphs outlining the methods used in proving the presence of the humoral factor and the chemical procedure for its extraction from tissue

Dr D J Stephens, University of Rochester, School of Medicine and Dentistry

CLINICAL STUDIES OF THE BONE MARROW

Description A demonstration of histologic sections, photomicrographs, and differential counts of the bone marrow, showing the changes which take place in the bone marrow in various diseases

Dr Samuel H Bassett, University of Rochester, School of Medicine and Dentistry

METABOLIC STUDIES ON IDIOPATHIC STEATORRHEA.

Description Photographs and charts illustrating abnormalities in metabolism in idiopathic steatorrhea and cardiac disease

trating abnormalities in metabolism in idiopathic steatorrhea and cardiac disease

Dr E H Keutmann, University of Rochester, School of Medicine and Dentistry

STUDIES OF THE MECHANISM OF ALBUMINURIA

Description The effect of various factors on proteinuria have been studied and are illustrated graphically. The following procedures were found to influence proteinuria, the level of the protein in the diet, diuretics which cause increase of glomerular filtration, expanding the blood volume, increase in the protein content of the circulating plasma by transfusion of normal plasma

In all these variations three factors seem to govern proteinuria (1) the permeability of the glomerular capillaries (2) The rate of glomerular filtration (3) The amount of protein available for manufacture of serum proteins

Dr Herman E Pearse, University of Rochester, School of Medicine and Dentistry

TREATMENT OF INFECTIONS OF THE NECK AND THEIR COMPLICATION, MEDIASTITIS

Description Drawings and x-rays showing anatomical and pathological basis for surgical technique

Dr W J Merle Scott, University of Rochester, School of Medicine and Dentistry

SURGERY OF THE SYMPATHETIC NERVOUS SYSTEM

Description Charts, drawings and x-rays to illustrate the various diagnostic and therapeutic methods in this field

Dr John J Morton, University of Rochester, School of Medicine and Dentistry

THE PATHOLOGY OF BONE.

Description Radiographs of pathological lesions, outlines of clinical histories, and microphotographs of specimens will be shown

Drs George P. Berry and Jerome Syverton, University of Rochester, School of Medicine and Dentistry

FILTERABLE VIRUS TUMORS

Description The characteristics of certain animal tumors due to the activity of filterable viruses is illustrated by means of photographs, and of gross and microscopic preparations of pathological material. The transformation of the virus of Rabb-

Fibroma (Shope) into that of Infectious Myxomatosis (Sanarelli) is also illustrated

Drs Marian LeFevre, Richard Manly, William Beale, Harold Hodge, University of Rochester, School of Medicine and Dentistry

PHYSICAL AND CHEMICAL STUDIES OF TEETH

Description A Physical properties *Hardness*, photographs of tooth surfaces showing method of hardness measurement, graphs *X-ray Absorption*, chart of method, x-rays of slabs showing changes in dentistry following caries and attrition *Density*, apparatus for measuring density of powdered enamel, dentine, cementum and for separating tissues by flotation, graphs *Index of Refraction*, microscopic determination demonstrated, graphs *Optical properties in polarized light*, demonstration of prismatic colors in normal teeth and caries

B Chemical properties *Analytical*, differences between certain teeth and from side to side of jaws *Molecular constitution*, x-ray diffraction patterns, charts of molecular arrangements of atoms in tooth and bone substance.

Drs Charles D Kochakian and John R. Murlin, University of Rochester, School of Medicine and Dentistry

THE MALE SEX HORMONES

Description Photographs, graphs, charts, specimens Preparations of extracts, syntheses and various physiological effects

Dr Robert G Sinclair, University of Rochester, School of Medicine and Dentistry

GROWTH EFFECTS ON SUGAR AND VARIOUS FATTY ACIDS IN DIET

Description Charts illustrating the facts that there is deficient growth on diets lacking in highly unsaturated fats, that growth is restored when highly unsaturated fats are supplied, that there is very poor growth on diets rich in fats lacking in highly unsaturated fatty acids, and that considerable though subnormal growth is obtained when such facts are replaced by cane sugar Inference is that there is synthesis of es-

sential fatty acids from sugar but amount is inadequate for normal growth.

Dr Basil G Bibby, University of Rochester, School of Medicine and Dentistry

BACTERIOLOGY AND TOOTH SURFACES

Description The bacterial formations or plaques which form on tooth surfaces are illustrated by photographs These films were sectioned after removal from teeth by acid decalcification The characteristics of filamentous bacteria isolated from tooth surfaces are also shown

Dr Frederick W Williams, New York

CLASSIFICATION OF THE SURGICAL LESIONS OF THE LOWER EXTREMITY IN DIABETICS

Description Photographs and legends showing the lesions in their proper classification and the results of treatment both conservative and operative

Dr Cornelius F McCarthy, Auburn.

MEDICAL, HISTORICAL EXHIBIT

Description An exhibit of old books, pictures and records There is a complete series of minute books of the Cayuga County Medical Society from 1806 to 1936. Also old surgical instruments, etc.

Dr John R Williams, Rochester

THE MECHANISM OF INSULIN ACTION

Description Charts and graphs demonstrating the action of insulin in the human body

Dr Terry M Townsend and Associates, Urological Service, Morrisania City Hospital, New York

KIDNEY PATHOLOGY

Description Museum specimens and wax models illustrating various types of kidney lesions and conditions A demonstration in connection with motion picture theatre exhibit comprising films in color with sound, and in color only entitled "Pyelotomy for Stone" "Perineal Prostatectomy," "Suprapubic Cystotomy"

MOTION PICTURE THEATRE

A Division of the Scientific Exhibit, Rochester Chamber of Commerce

Series of Medical Motion Pictures, continuous 9 00 A M to 10 00 P M, Monday, Tuesday and Wednesday, May

24th, 25th and 26th The titles and time schedule will appear in the final official program

PROGRAM OF THE WOMAN'S AUXILIARY

Mrs JOHN L. BAUER, *President*

Mrs CARLTON F POTTER, *Convention Chairman*

Convention Headquarters, Hotel Seneca, Rochester, N Y

All Doctors' wives will please register at Registration Desk on Mezzanine floor, Hotel Seneca

All Doctors' wives, whether members of a Woman's Auxiliary to a County Medical Society or not, are cordially invited to participate in all parts of the program

Monday, May 24

9 00 A M REGISTRATION OF DELEGATES, Mezzanine floor

Mrs Irving J Sands, *Chairman*

Mrs Charles H Hitchcock, *Vice-Chairman*

GENERAL REGISTRATION OF ALL DOCTORS' WIVES, 9 00 A M to 5 00 P M throughout the Convention, Mezzanine floor

Mrs Milton Bergmann, *Chairman*

Mrs Horace W Whiteley, *Vice-Chairman*

10 00 A M EXECUTIVE BOARD MEETING, Blue Parlor, Mezzanine floor

Technical Exhibits

The largest exhibition of any up-state meeting, features the 131st Annual meeting

Taking the capacity for space at the Rochester Chamber of Commerce Building, seventy-five exhibitors are preparing to display products that are essentially a part of every physician's daily requirements. In addition to their number, few, if any, technical exhibits have attracted such an inclusive array of outstanding medical products and services

ducts and services

No attending member or guest of the Medical Society of the State of New York, should fail to visit every booth and to find the time to check personally on the merits of every product presented entirely for inspection by physicians

The Technical Exhibit, primarily and exclusively a private showing for the medical profession, include the following

- American Agency of French Vichy, Inc, Brooklyn
 American Cystoscope Makers, Inc, New York
 American Hospital Supply Corporation, Chicago, Ill
 American Safety Razor Corporation, Brooklyn
 The Arlington Chemical Company Yonkers
 Bard-Parker Company, Inc Danbury, Conn
 Barr Laboratories, Inc New York
 Bausch & Lomb Optical Co Rochester
 Bilhuber-Knoll Corporation, Jersey City, N J
 Burroughs Wellcome & Co (USA) Inc, New York
 Cambridge Instrument Co, Inc, New York
 Cameron Heartometer Company, Chicago, Ill
 Cameron Surgical Specialty Company, Chicago, Ill

Annual Meeting

Entertainment at Rochester Meeting

Heretofore at the annual meeting of the State Society, in the endeavor to make the occasion as pleasurable as possible, entertainment features of various kinds have been arranged for various hours during the session. Under such a plan the visitor frequently has been confronted with the alternative of foregoing a scientific program in which he might have keen interest for some appealing entertainment feature, or to sacrifice the latter completely if he were serious minded about the program.

The Rochester Committee has wisely provided against this difficulty. Entertainment, for the most part, will be centered on the final day, Thursday, May 27, and will be so arranged that one can satisfy many tastes. For those who are interested in things purely scientific and clinical, the privilege of visiting the Strong Memorial Hospital and University Medical School will be afforded. To the lover of Nature, a visit to Highland Park is recommended. This splendid arboretum, one of the finest in the world, will be at its best in May. It will be the season of the lilacs and the rhododendron. These remarkable collections attract world-wide attention because of their beauty and completeness.

The great scientific industries, the Bausch and Lomb Optical Company and the Eastman Kodak Company, will permit inspection

tours on this day. This is an unusual privilege, filled with thrills and fascination.

The great event of the day will be the golf tournament at the Oak Hill Country Club, with its two championship courses. Although there will be but eighteen holes of play, it will be possible for each golfer to enter several contests. Most of the events are handicap affairs, so that lack of skill need not deter one from playing. The Lilly Trophy Competition, which is played annually by the Academies of Medicine of New York State and Ontario, will be the main feature. Inter-city team matches between various cities of the State and Canada are another feature. There will be a contest for left-handed physicians and another for the doctors of the old school, who no longer wear whiskers but who will admit advancing years.

For these contests prizes of considerable value are offered. In addition to merchandise consisting of scientific instruments and supplies donated by leading manufacturers, there are six sterling silver cups and bowls for championship prizes, the value of which is several hundred dollars.

It is expected that there will be at least three hundred participants in the golf tournament, which will conclude with a banquet in the beautiful ballroom of the club.

Rochester's Medical Sit-Down Strike

Rochester's medical sit-down strike is scheduled for May 24 to 26. Differing from other such periods of gluteal repose, we are giving long advance notice, that on these dates the convincingly ill and the exotically neurotic may resort to medication in vain while the wiser physicians hereabouts park their fundaments in the sessions of the annual meeting of the Medical Society of the State of New York. Through most courteous co-operation on the part of the local Chamber of Commerce and most able efforts on the part of the committee of arrangements, we are in a position to promise the finest physical set-up that the state meeting has ever experienced in any

city west of Montauk Point. The state society's remarkably high standard of scientific programs and commercial exhibits will be augmented by special entertainment efforts of local industries, by unusually enjoyable arrangements for that distaff element and by a golf day that will restore pristine elasticity to the coronaries. The doctor's usual forty(?) hour week may have to be extended a little but local physicians will be pleased much by a long stay and an active participation on the part of those who are so unfortunate as to live elsewhere.

COMMITTEE ON LEGISLATION

Bulletin No 9

March 18, 1937

Since the issuance of our last bulletin the following bills have been introduced

Senate Int. 1368—Esquirol, adds new section to the Labor Law, prohibiting the employment of any person as a domestic servant, suffering from contagious or communicable disease, and requiring all such servants to furnish health certificate of a physician, including Wassermann test Referred to the Labor Committee.

Senate Int 1369—Feld, osteopathy bill Same as Assembly Int 1605—Milmoe Referred to the Education Committee

Senate Int 1444—Howard, amends the Labor Law generally and section 2 of the Workmen's Compensation Law, defining powers and duties of the Industrial Board, providing for Workmen's Compensation Board of five members to be appointed by the Governor, to perform duties detailed to it by the Industrial Commissioner and to hear and determine compensation claims, and appropriating \$65,000 Referred to the Labor Committee

Assembly Int. 1901—Hillig, amends the Public Health Law by striking out the provision that child or person not vaccinated shall not be admitted to school in city of 50,000 or more and requiring certificate from physician during smallpox epidemic only in school district or an adjoining district instead of any city school Referred to the Health Committee

Comment We have not had an antivaccination bill for several years In writing to your Assemblymen, call attention to the fact that the smallpox epidemic of last summer in the western part of the State would never have gotten a start had the law required vaccination of all school children

Assembly Int. 1904—Sullivan, adds new Art 59 to the Education Law, providing for regulation of practice of dispensing optician Referred to the Education Committee

Assembly Int 1907—Maisel, requires the State Health Commissioner, with approval of Governor, to select suitable sites for three state cancer hospitals, one to be in New York City for which \$500,000 is appropriated, and two outside of New York City for which \$100,000 is appropriated, a new Art 18-a is added to the Public Health Law for establishing such hospitals and providing for superintendents and admission of patients Referred to the Ways and Means Committee

Comment Similar to the Mahoney-Gugino bill except that it provides for the

erection of a hospital in New York City instead of Buffalo

Assembly Int 1995—Stephens, amends the Public Health Law by providing that where inmate of state tuberculosis hospital is unable to pay for care, he shall be maintained by the state, and appropriating \$150,000 Referred to the Ways and Means Committee.

Comment This is the fifth bill of this type to be introduced at this session

* * *

Our Lien Bill is under heavy fire in the Assembly Judiciary Committee. IT IS EXCEEDINGLY IMPORTANT THAT YOU TALK WITH YOUR SENATORS AND ASSEMBLYMEN OVER THIS WEEK-END ABOUT THIS BILL The New York City Bar Association has violently attacked the bill There is enclosed a copy of the brief they submitted to the legislators *Other Bar Associations which have disapproved the bill are* Brooklyn Bar Association, Brooklyn Women's Bar Association, Onondaga County Bar Association, Rochester Bar Association, Chemung County Bar Association, and the Livingston County Bar Association The Genesee County Bar Association alone has approved the bill

HOMER L. NELMS
JAMES L. GALLAGHER
B WALLACE HAMILTON
JOHN J. MASTERSON
LEO F. SIMPSON

NEW YORK CITY BAR ASSOCIATION communicated to each Senator and Assemblyman the following opposition to our Lien Bill

The bill would create a new lien in favor of physicians and nurses Claims on account of personal injuries resulting from negligence of another would be charged with the lien "for the amount of the reasonable charges of such physician or nurse" for treatment, care and services.

The injury must occur within one week prior to the treatment. The physician or nurse must first file in the office of the county clerk in the county where the services are rendered, and send by registered mail to the party alleged to be liable for the injuries, a statement containing such information as the name and address

of the claimant and the name and address of any third parties alleged to be liable. A similar statement must be mailed to any insurance carrier which has insured the party alleged to be liable. Payments to the injured person prior to the filing of such notice are not affected by the notice. Within five days after concluding the treatment, the physician or nurse must file in the office of the county clerk a verified statement of the amount of the lien.

The bill is modeled after the lien granted to charitable hospitals pursuant to L 1936, Ch 534, which was disapproved by this Committee in 1936, No 73. The lien is subordinate to the lien of an attorney upon a cause of action arising out of the injury treated.

The verified statement to be filed need only show "the total amount of the charges claimed." No description of the services rendered is required and no safeguards are provided to limit the amount of the claim, such as the agreed price or reasonable value of the services, similar, for example to that required under Section 9 of the Lien Law relating to the notice of a

mechanic's lien. No notice of the claim of lien is required to be given to the injured person. The bill makes it mandatory for physician or nurse to mail notice to any insurance carrier, a duty which either may be unable to discharge for lack of knowledge. No provision is made for the cancellation of the record of the lien. There are no specific provisions for permitting the injured party to test the validity or the amount of the lien, the only limitation on enforcement relates to the party who is liable to the one injured. The bill provides that such party shall remain liable to the lienor for a period of one year from the date of payment to the one injured.

In addition to these objections, Subdivision 2 of the bill grants the lien to any "specialist" or "consultant" called in the case by the physician, without limitation as to time and without first affording the injured party or his representatives an opportunity to be heard. This provision places the expenses of treatment beyond the control of the injured party or his representatives.

THE LITTLE BOY--THAT'S ME

An intriguing anecdote has been discovered by a Massachusetts physician, Dr William Pearce Cowes, in Sacha Guitry's "If Memory Serves," and is reprinted in the *New England Journal of Medicine*.

Guitry had informed Vallery-Radot, Pasteur's son-in-law, that he wished to read the play to him and Madame Vallery-Radot. The request was granted, but Guitry was received with much coolness, and it at once became clear to him that the Vallery-Radots disapproved in advance of the idea. "Sir," said Vallery-Radot, "I should like you to know that my wife and I will do everything in our power to prevent the performance of your play. It is a matter of principle with us and we think it only fair that you know this before you read us your play."

After the reading, the Vallery-Radots completely changed their minds. In the play Guitry's father, Lucien Guitry, took the part of Pasteur.

Sacha Guitry says that, "On the opening night I observed a modestly dressed man of pleasant appearance standing in the shadow of the wings. As each act began he would go closer to the set, listen eagerly, and peer between the walls of the scenery with such interest that I quite forgot to remind him that 'only members of the cast are allowed backstage during the performance.' But during the third act, when for the first time Pasteur is about to inoculate a small boy against the rabies, I saw my man open a door in the set part way in order the better to see what was going on. I asked him not to do that. He said, 'Excuse me, sir. I am the concierge at the Pasteur Institute, and I particularly want to see this scene.' I asked why. 'Because that's me.'"

"You? Which one?" "The little boy. That's me. I was the first one whose life was saved by Monsieur Pasteur!"

HE HAS HIS TOES WELL IN HAND

A special cable to the *New York Times* from Moscow says that making fingers out of toes was successfully accomplished for a young worker named Baskoff by Professor M I Kushik of the Central Traumatological Institute in Leningrad.

Baskoff, who works in a lumber factory, lost two fingers in a saw. Professor Kushik attached the stumps to the man's toes. After three weeks in an uncomfortable position it was found the toes united with the

fingers. Whereupon Professor Kushik amputated the toes and, after some reshaping of them, Baskoff four weeks later had new and serviceable fingers.

This rare operation is said to have been first attempted unsuccessfully toward the end of the last century by an Italian surgeon, Professor Nikoladoni. Professor Vradel of Leningrad had succeeded in such an operation on lower animals.

COMMITTEE ON WORKMEN'S COMPENSATION

It has come to the attention of this Committee that certain employers have attempted to enter into agreements with certain physicians to treat injured workmen without complying with the full requirements of the law in regard to reporting

In some instances such physicians have been offered medical work in volume but at a rate not in accordance with the fee schedule. Of course this practice is a violation of the amended Workmen's Compensation Law and physicians are advised of this fact

The following communication has been received from the Industrial Commissioner and is self-explanatory

DAVID J. KALISKI, M.D., *Chairman*

STATE OF NEW YORK
DEPARTMENT OF LABOR
ALBANY

April 5, 1937

Dr. David J. Kaliski, Chairman
Workmen's Compensation Board
New York County Medical Society
2 East 103rd Street
New York City

Dear Doctor Kaliski:

I have your communication of April 1, 1937 advising that you have received numerous inquiries during the past few months, concerning the practice of certain employers entering into agreements with physicians not to report minor injuries and to accept fees directly from these employers rather than from their insurance carriers, and requesting a statement from me supporting your contention that all cases must be reported by both the physician and the employer

In answer may I say that it is mandatory that all authorized physicians submit proper medical reports on all compensation cases under penalty of being removed from the panel for such failure as provided in Section 13-D-2 (c) which I quote as follows

The Commissioner shall remove from the

list of authorized physicians any physician who has failed to submit full and truthful medical reports required to be made by him to the Commissioner or the Industrial Board.

With reference to employers reporting accidents, will advise that the law requires that all accidents resulting in disability beyond the day of the accident must be reported by the employer as provided in Section 110 quoted as follows

Record and report of injuries by employers. Every employer shall keep a record of all injuries, fatal or otherwise, received by his employees in the course of their employment. Within ten days after the occurrence of an accident resulting in personal injury which shall cause a loss of time beyond the day or working shift on which the accident occurred, or which shall require medical treatment beyond ordinary first aid, a report thereof shall be made in writing by the employer to the Commissioner upon blanks to be procured from the Commissioner for that purpose. Such report shall state the name and nature of the business of the employer, the location of his establishment or place of work, the name, address and occupation of the injured employee, the time, nature and cause of the injury and such other information as may be required by the Commissioner. An employer shall furnish a report of any other accident resulting in injury received by an employee in the course of his employment or an occupational disease incurred by an employee in the course of his employment whenever directed by the commissioner. An employer who refuses or neglects to make a report as required by this section shall be guilty of a misdemeanor punishable by a fine of not more than five hundred dollars

It seems to me that according to the provisions of Section 13-D-2 (c) instruction may be issued to the Medical profession directing that proper medical reports be completed and filed on all compensation cases without exception

Very truly yours,
(signed)—ELMER F. ANDREWS
Industrial Commissioner

The Significance of a Positive Tuberculin Reaction

More than a million school children were tested with tuberculin last year. Most of the positive reactors were urged to consult their family physician for an interpretation of the test. What is the significance of a positive tuberculin reaction and what shall the doctor do about it? Lewis J. Moorman gives a specific and balanced answer in an article entitled "The Duty of the Family Physician in the Presence of a Positive Tuberculin Test"

A positive tuberculin test, particularly in the period of childhood or adolescence, places before the family physician the difficult task of carefully following a few of the knotty threads which help to make up the complicated fabric of human life.

He must realize that a positive reaction means that the tubercle bacillus has entered the human organism and has produced a pathological condition known as tubercle. In reality, a positive test warrants a diagnosis of tuberculosis. It is doubtful if we are justified in continuing to teach that there is a difference between disease which does not produce obvious symptoms and which never manifest demonstrable pathological changes during life, and the same disease which gives rise to the symptoms of toxemia with the demonstrable signs of gross pathology.

Possibilities Following Infection

Infection with the tubercle bacillus carries a wide range of possibilities. The disease may never cause obvious symptoms or demonstrable pathology. It may, particularly in infancy, lead to the development of one of the acute forms of tuberculosis which usually, in a relatively short time, prove fatal. Generalized miliary tuberculosis, tuberculous meningitis and the acute pneumonic types of pulmonary tuberculosis are among the common forms. If the child with a positive tuberculin test lives to be three or four years of age without developing manifest progressive disease, even though the x-ray may show what we call the primary complex (a calcified or Ghon tubercle in the parenchyma of the lung with secondary involvement of tracheobronchial lymph nodes), we may reasonably anticipate that he will carry on through childhood without clinical manifestations of disease.

When he arrives at the age of puberty there seems to be an inexplicable susceptibility to active progressive disease either through endogenous or exogenous reinfection. Then follows the train of variable

possibilities always accompanying manifest tuberculosis.

Time will not permit a detailed discussion of these possibilities. Suffice it to say that the individual with a positive tuberculin test faces all the possibilities inherent in the wide range of hematogenous clinicopathological manifestations from the relatively inert primary complex through mild, moderately severe, to overwhelming generalized tuberculosis, and from low-grade fibrotic bronchogenic lung lesions through progressive stages of caseo-ulcerative forms, to widespread bilateral multilobar involvement which so often precedes death.

Physician's Responsibility

What has been said emphasizes the grave responsibilities resting upon the family physician when he stands in the presence of a child exhibiting a positive tuberculin test. Obviously he must throw about such an individual every available safeguard.

A positive tuberculin test has other implications and places upon the family physician other obligations. Having discharged his duty with reference to the individual manifesting the evidence of infection, he must consider the probable source of infection. Infection with the tubercle bacillus means contact with the tubercle bacillus. This usually means intimate contact with some one who has open tuberculosis. Naturally some one in the home must be considered the most probable source of infection. A negative family history is of little importance. Each member of the family, including relatives, servants and others who may reside in the home, should have a tuberculin test, and every one exhibiting a positive test should have a thorough examination, including an acceptable x-ray of the chest. Any member of the household manifesting symptoms or signs of pulmonary disease should be examined even though the tuberculin test is negative. Repeated sputum examinations should be made in suspected cases where sputum is available. Accepting a single negative sputum examination as final often leads to disaster.

Reprinted by permission of *Tuberculosis Abstracts*, March 1937

Determine Source of Contact

If such a searching investigation fails to reveal the source of infection in the home, we must consider the possibility of contact with tuberculous teachers, neighbors, or visiting friends and relatives. Finally, hand to mouth infection must be considered. The baby on the floor, the child playing jacks or marbles on the street, may easily make contact with tubercle bacilli which have been deposited there by someone suffering from open tuberculosis. Occupants of the home may carry tubercle bacilli on their feet or they may be carried in by dogs and cats. Contaminated food may constitute another source of hand to mouth infection.

Thanks to those who have instituted the wise handling of dairy herds in this country, and the added precaution of pasteurization of milk before delivery, we see relatively little bovine tuberculosis in the United

States. However, we must not forget the possibility of infection from undiscovered tuberculous cows privately owned or in dairy herds.

We must admit that the execution of the proposed program is often difficult. Nevertheless, the obligation rests squarely upon the shoulders of the physician who discovers a positive tuberculin test. Fortunately for those physicians who may not be interested, or who may not desire to carry out such a program, the aid of specialists or voluntary and public health agencies in the field of tuberculosis may be secured. The same sources of service may be recommended to the physicians who are interested in executing the program but feel the need of help with certain phases of the examination.

The Early Diagnosis Campaign

Osler's Principles and Practice of Medicine. "A last word on the subject of tuberculosis to the general practitioner. The leadership of the battle against this scourge is in your hands. Much has been done, much remains to do. By early diagnosis and prompt, systematic treatment of individual cases, by the prompt recognition of contact cases, by striving in every possible way to improve the social condition of the poor, by joining actively in the work of the local and national anti-tuberculosis societies you can help in the most important and the most hopeful campaign ever undertaken by the profession."

For ten consecutive years the tuberculosis associations of the United States have been conducting in the month of April an annual publicity campaign for the early diagnosis of tuberculosis. Dr. Edward L. Trudeau, the pioneer of the fight against tuberculosis in the United States, went on record at the first meeting of the National Tuberculosis Association on May 18, 1905, as follows:

"The first and greatest need in the prevention of tuberculosis is education, education of the people, and through them education of the state. It is evident that if every man and woman in the United States were familiar with the main facts relating to the manner in which tuberculosis is communicated and the simple measures necessary for their protection, not only might we reasonably expect as a direct result of this knowledge a great diminution in the death rate of the disease, but the people would soon demand and easily obtain effective legislation for its prevention and control."

"When a state has once become well educated, and not before, will the other

requisites necessary to the control of the disease be forthcoming?"

This fundamental principle is as valid today as it was 32 years ago. The tuberculosis associations of the country appreciate the cooperation and leadership which the medical profession has always offered. Again the farsighted physician is urged to lend his help to this year's campaign.

The theme of the 1937 E. D. C. (Early Diagnosis Campaign) is "Uncover Tuberculosis with Modern Methods." For the campaign three leaflets have been produced.

The first leaflet called "Signals" deals with early symptoms of tuberculosis and the importance of consulting the doctor on their first appearance. It is a discouraging fact that in the last ten years no appreciable increase has occurred in the proportion of "early cases" admitted to sanatoria. This is in spite of years of earnest educational efforts urging people to obtain medical advice on the appearance of the earliest symptoms which are enumerated in the pamphlet. One of the explanations offered is that some of the early symptoms are not sufficiently severe to prompt people to action. In fact they are often so subtle as to be overlooked even by the doctor.

surveys of large numbers of sanatorium patients have shown that fatigue is often the first and only warning signal. Another danger sign which is just as often overlooked or disregarded by the patient is a group of symptoms which we commonly call indigestion. A cough that hangs on, loss of weight, blood spitting, pleuritic pain, are more likely to cause a man or woman to visit the family doctor. The physician's greatest part in the fight against tuberculosis is his willingness to investigate these danger signs at once, bearing in mind that often it is impossible to exclude tuberculosis without an x-ray of the chest. The files of tuberculosis sanatoria are filled with case histories showing that cases were diagnosed far too late. Not only is syphilis, as Osler says, a great imitator but tuberculosis also imitates the symptoms of many other diseases.

The somewhat out-dated survey by Dr Linsly Williams and Miss Alice Hill has furnished data relating to the fate of about 1,500 tuberculosis sanatorium patients. A regrettable large number of these cases were first diagnosed as bronchitis, pleurisy, colds, "congestion" of the lung and a great variety of other diseases including malaria, cancer,

anemia, pathological conditions of the liver, kidney, bladder and even rheumatism.

Only the four classic symptoms of early tuberculosis—fatigue, loss of weight, cough and indigestion, are mentioned in the pamphlet. Care is taken to make clear that none of these symptoms is pathognomonic but that any of them should be considered as a danger signal to be investigated by the physician, emphasizing the advice that he be consulted *early*.

The second booklet "It Can Happen" deals with the tuberculin test and is addressed to high school groups.

The third booklet "In Every Home" deals with the age-old story of contacts.

It is abundantly recognized that the reason for failure to find early cases cannot result entirely from the apathy of patients nor from lack of vigilance on the part of the doctor. Sanatorium men recognize the fact that more and more cases appear where the transition from the "early" or "silent" stage of tuberculosis to the moderately advanced or far advanced is relatively swift and only by the barest chance is the minimal case detected if the fluoroscope or the x-ray is not used as a standard aid in diagnostic practice.

MAKE RESERVATIONS NOW FOR ANNUAL BANQUET

The Annual Banquet of the Medical Society of the State of New York will be held on Tuesday evening May 25 at seven P.M. in the large Assembly or Dining Hall of the Chamber of Commerce, in Rochester.

Aside from the Speakers' table, which will have twenty-five of the outstanding men in the American Medical Profession, eight hundred other seats will be available.

The guest Speakers of the evening will be Dr Gordon Lang of the University of Chicago whose topic will be, "Is the Doctor Human?," Doctor Wingate Todd of Western Reserve University whose topic will be, "Shadows in the Mirror of Health," and

Mr Carl Ackerman, Dean of the School of Journalism, Columbia University, whose talk will be "The Doctor and Public Opinion."

There will be music during the entire dinner which will be the best ever, and dancing will follow the speaking.

In order to assure yourself and your wife of ideal table reservations, it would be wise to contact Dr E. T. Wentworth or Dr B. J. Duffy, addressing your letters to 13 Prince Street, Rochester, N. Y.

The price of the dinner tickets is five dollars.

FOR FITTER FIREMEN

The New York City Fire Department has determined that it is necessary for those on the eligible list for appointment in its department be given x-ray and Wasserman tests by the Department of Health before being certified for appointment by the Civil Service Commission, in order to determine whether or not in these respects they are physically fit. This new precaution will

protect the public both against undiscovered and usually curable sources of infection and also against latent but possibly serious and costly physical disability in its fire force. It will also be added protection to the men found free from these diseases. Finally it will prove a blessing to men who are found in need of medical treatment.

PRIZE FOR REPORT ON CASES OF PNEUMONIA

The Advisory Committee on Pneumonia Control of the New York State Department of Health offers a prize of one hundred dollars for the best report of a series of cases of pneumonia

The competition is open to all physicians residing and practicing in New York State outside of New York City. Interns in hospitals may compete but the report in all cases should include only those cases actually seen and studied by the writer, and should include all cases of pneumonia of all types and forms treated by him either in private practice or in hospitals during the present winter.

In awarding the prize less stress will be laid upon the number of cases than upon the objectivity exhibited by the writer in his description of the cases and upon the originality and independence shown in the interpretation of the clinical features. Credit will be given for the extent to which the newer methods of diagnosis and treatment of cases of lobar pneumonia were employed. If the writer desires, the report may be documented by full clinical histories and laboratory reports, but the report itself should not be longer than 5,000 words and be in a form suitable for publication in the *NEW YORK STATE JOURNAL OF MEDICINE*.

Reports should be in the hands of the Committee not later than August 15 and the award will be made October 1.

Address further inquiry to

Dr. Edward S. Rogers,
Director, Bureau of Pneumonia Control,
New York State Department of Health,
Albany, N. Y.

Medical News

Albany County

THE DEDICATION OF THE Theobald Smith Memorial Laboratory of Albany Medical College, Union University, took place on March 19. In the afternoon Dean Thomas Ordway made an address at the unveiling of a plaque of Theobald Smith. At the evening exercises Doctor Charles R. Stockard of Cornell University Medical School delivered an address on "The Spirit of the Laboratory." The Theobald Smith Memorial Laboratory houses the Departments of Physiology and Pharmacology and of Experimental Surgery.

Broome County

THE MEETING OF THE Broome County Medical Society at the Monday Afternoon Club House, Binghamton, on March 9, was largely devoted to the consideration of impending State Legislation which directly or indirectly, sometimes vitally, affects the practice of medicine and public health.

The Society was invited by the Endicott-Johnson Medical Department to dinner at the Nurse's Home, Wilson Memorial Hospital, Johnson City, March 23. The speaker was Dr. Hugh Cabot, Chief of the Urological Service, Mayo Clinic, Rochester, Minn. Subject—"Methods of Diverting the Urine above the level of the Bladder and Destructive Lesions of that Organ."

Cortland County

THE CORTLAND COUNTY Medical Society met in the Cortland Free Library, March 19. Drs. Samuel H. Munford, internist, and Walter S. Thomas, pathologist, spoke on "A Clinico-Pathological Conference with Case Reports of Extreme Interest, Yet of Very Practical Application to Every-Day Practice." The discussion was opened by Drs. Walsh and C. D. Ver Nooy. Reported by O. E. White, M.D., Secretary.

Dutchess County

A REGULAR MEETING OF THE Dutchess County Medical Society was held March 10 at Hudson River State Hospital. The meeting was featured by a paper on "Syphilis—Public Health Aspects, Diagnosis and Treatment," by Dr. W. A. Brumfield, Jr., director of the division of social hygiene,

State Department of Health. The society will tender a complimentary dinner to Drs. James E. Sadlier and John S. Wilson, commemorating their fifty years in the practice of medicine.

Erie County

THE MARCH MEETING of the Medical Society of the County of Erie was held the 15th, and had as guest speaker Dr. David J. Kaliski, chairman of the Committee on Workmen's Compensation of the Medical Society of the State of New York. His address on the Principles of the Workmen's Compensation Law was informative and served to allay some objections to the law which had arisen through a misunderstanding of certain provisions and rulings by the Industrial Commissioner.

THE PROGRAM FOR THE stated meeting of the Medical Society of the County of Erie, held April 19, was devoted chiefly to the annual report of the Survey Committee on Maternal Mortality for Erie County. A report on the progress made during the past three months by the Hospital Service Corporation for Western New York was presented at the same meeting.

THE SOCIETY'S COMMITTEE on Public Health, pursuant to instructions, has arranged with the special Survey Committee of the Society to present to the Buffalo Board of Health for study a physicians' Participation Plan in preventive medicine to cooperate with the Buffalo Department of Health.

MEMBERS OF THE sub-committee of the Committee on Public Health and Education of the Medical Society of the State of New York were in session in Buffalo, March 23, to arrange tentative plans for Western New York in the preparation of next year's public health program which will be devoted to Child Hygiene. Present at the meeting were Drs. Thomas P. Farmer, Peter Irving, Edward J. Wynkoop, Chairman of the sub-committee on Child Hygiene, and Oliver W. H. Mitchell.

Jefferson County

THE FINAL LECTURE in a course on Obstetrics as arranged by the Committee on

Public Health and Medical Education of the State Society, for the Jefferson County Medical Society is scheduled for May 6, 6 30 P M at the Black River Valley Club, Watertown Dr Raymond J Pieri will speak on "Pre-Natal and Post-Natal Care"

Kings County

AT A LUNCHEON GIVEN BY Mrs Charles A Gordon at her home, plans were formulated for the Spring luncheon to be held at the Hotel Astor, Manhattan, on May 11 by the Woman's Auxiliary to the Medical Society of the County of Kings Mrs Gordon will be chairman of the luncheon, with Mrs Edwin A Griffin, president of the auxiliary, Mrs John L Bauer and Mrs Frank Jennings as her cochairmen

A MARKED INCREASE IN THE number of diphtheria cases has spurred the Kings County Medical Society to appeal to Brooklyn physicians for "more aggressive measures for the control of this disease which could be and should be eliminated from our city" In fact, the Medical Society addressed its members "There is no reason why diphtheria should not be as much a medical curiosity in New York City as smallpox is today"

BROOKLYN IS IN NO DANGER of becoming a happy hunting grounds for a bunch of "liars, cheats and loafers" bent on wangling free medical care from the city, says Health Commissioner Dr S S Goldwater Describing as exaggerated a denunciation of the "medical chiseler" made recently before the Kings County Medical Society, Commissioner Goldwater declared "No more than two per cent. of persons using free hospital dispensaries in the borough have been shown to have made false claims"

Monroe County

DR EDWARD S ROGERS, director of the division of pneumonia control of the state Department of Health, is quoted in the Rochester papers as saying that he found the Monroe County pneumonia campaign more progressive than that of any other county in the state

Montgomery County

THE MEDICAL SOCIETY OF the County of Montgomery was host in Amsterdam on March 18 at a dinner and card party, wives of a majority of the members being guests Dr A J Townley, president of the medical

society, appointed a committee of ladies to serve as a committee of the Ladies' Auxiliary

Nassau County

THE EXECUTIVE BOARD of the Women's Auxiliary to the Medical Society of Nassau, on March 16 gave a dinner at the Bar Association building in Mineola for Dr Charles Gordon Heyd, president of the American Medical Association After the dinner Dr Heyd addressed a joint meeting of the Auxiliary and the Society on "The Survival of Medicine as a Profession."

New York County

A CAREFUL INVESTIGATION has been made, by the Committee on Civic Policy, into the possibility of obtaining a pension plan for members of the County Medical Society A number of insurance companies cooperated with the Committee in this investigation. However, a pension plan suitable to the needs of the County Medical Society could not be obtained at reduced premiums without too great an initial financial outlay by the Society

A PLAN entitled "Partial Adjusted Health Insurance," presented by Dr Arthur Coca, is now under investigation by the Committee on Economics This provides that approximately two-thirds of each medical bill be paid for by a state health insurance, and the remainder by the patient himself Such a plan would obviate any malingering on the part of certain patients, would be operated by the profession, and would amount essentially to a socialization of the means of collection, with a retention of the individual practice of medicine. The plan in detail is now under consideration by the Committee

A SURVEY IS BEING MADE by the Committee on Economics of "the frequency with which medical services are sold by hospitals, and income, justly due the medical profession itself, deviated to administrative expenses"

A PLAN HAS BEEN worked out by the Special Committee on Hospitals and Dispensaries, in connection with the Associated Hospital Service, whereby doctors and their dependents join this plan as any other group and for the same insurance fee, but that as an additional concession, hospitals concede, private room accommodations instead of semi-private The proposal was submitted to the Associated Hospital Service and

the Hospital Conference which recommended it for adoption by its various members. To date no less than eighty-seven hospitals have adopted the plan. The committee recommends wide publicity and the organization of a County Medical Society. Physicians membership group in the Associated Hospital Service.

THE 44TH REGULAR MEETING of the Society of Medical Jurisprudence was held at the New York Academy of Medicine on March 8. A paper on "Medico-legal Aspects of the X-ray" was given by Louis J. Gelber, M.D., LL.B. A meeting is scheduled for May 10, "The Value of Non-Partum Expert Testimony," by Ramsey Spillman, M.D.

A CLINICAL SESSION on chronic pulmonary diseases, sponsored by the Tuberculosis Sanatorium Conference of Metropolitan New York, was held on April 7 at the Cornell University Medical College. "Primary Neoplasms of the Lung" (Pulmonary cancers) was discussed by Dr. Wolfgang Grethmann, Pathologist, Tuberculosis Service, Bellevue Hospital, Dr. Coleman B. Rubin, Associate in Medicine at Mt. Sinai Hospital, and Dr. William Francis Reinhoff, Jr., Associate Professor of Surgery at Johns Hopkins University and Medical School. Following this, general discussion was opened by Dr. Milton Sills Lloyd, Bronchoscopist, Flower-Fifth Avenue Hospital. Announcement is made by the Tuberculosis Sanatorium Conference of Metropolitan New York of the appointment of Dr. Edgar Mayer, Assistant Professor of Clinical Medicine of Cornell University Medical College, succeeding Dr. Foster Murray recently elected President of the Conference. Dr. William J. Ryan, Medical Director of the Summit Park Sanatorium, Pomona, New York, has been elected Vice-President.

Niagara County

DR. IRVING W. POTTER, gynecologist addressed twenty-five members of the Niagara County Medical Society on Mar. 9 at Lockport on "Rupture of the uterus with a Report of Cases."

Oneida County

DR. GEORGE EWART WILSON, FRCS, Toronto, addressed Utica Academy of Medicine on Mar. 18 on "The Commoner Fractures of the Extremities." Dr. Herman J. Sequal, Utica, read a paper, "Medical Treatment of Acute Abscess of the Lungs."

Onondaga County

A SPLENDID APPRECIATION of the fine maternal welfare campaign in Syracuse appears in *Briefs*, published by the Maternity Center Association in New York City. It begins:

Syracuse, that industrial city on the banks of the Erie Canal in New York's famed Mohawk Valley, is just now in the midst of a two-fisted campaign to provide good maternity care. No stone is being left unturned by a spirited committee of doctors from the Onondaga Medical Society to make the people of this community and the surrounding rural areas aware of the need of adequate attention during pregnancy and how needless deaths of mothers may be prevented.

There is no mincing of words in this campaign. The facts are told frankly and forcefully that mothers of Syracuse die or are crippled because they are not getting the care they should have. The people are warned that one-quarter of the maternity deaths are caused by abortion and, praise be, the newspapers print it and the radio stations broadcast it. Mothers are warned of the dangers of delay in seeking good medical advice and every effort is being pressed to make good care available to every mother who needs it.

A complete description of the Syracuse campaign, including outlines of the refresher courses, sample newspaper stories and radio talks, copies of the certificates of attendance, etc., may be secured free from the Maternity Center Association.

THE MARCH MEETING OF THE Women's Auxiliary to the Onondaga Medical Society was held on March 2 in the reception room of the Crouse-Irving Hospital. Dr. J. J. Buettner spoke on "Medical Legislation." "Is It True What They Say About Women?" was the subject of the historical sketch prepared and presented by Mrs. James Wilson. A book review was given by Mrs. Tracey Bryant.

MEMBERS OF ONONDAGA MEDICAL SOCIETY heard Dr. William A. Groat, Dr. Francis O. Harbach and Dr. I. H. Levy at their regular meeting on March 2 at the University Club, Syracuse.

Dr. Groat was the first speaker on a series of "What's New" reports on recent advances in medicine, discussing, "What's New in Diabetes?" Dr. Harbach discussed cancer, and Dr. Levy "Hypotension."

Members of the staff of Syracuse Memorial Hospital were in charge of a scientific program presented before the Syracuse

Academy of Medicine at its meeting on March 16 at the hospital

Ontario County

DR LEON A STETSON was host to the Canandaigua Medical Society on Mar 11 in his home Dr George Wright, of the Clifton Springs Sanitarium and Clinic staff, spoke on "Coronary Occlusion and Cardiac Pain"

Orange County

THE NEWLY-ORGANIZED Woman's Auxiliary of the Orange County Medical Society held its first meeting at the Middletown State Hospital, March 16

Queens County

THE PROGRAM OF THE Medical Society of the County of Queens, Inc, on March 30, included papers on "Prevention and Treatment of Venereal Disease"—Percy S Pelouze, M D, Professor of Urology at University of Pennsylvania, and "The Surgical Aspect of Venereal Disease"—by David Melvin Davis, M D, Professor of Genito-Urinary Surgery at Jefferson Medical College Discussors—Drs Francis G Riley and Benjamin Derrah

THE OPEN MEETING OF the Queensboro Surgical Society was held on April 21 at the Medical Society Building The speaker was Dr Dean Lewis, Professor of Surgery at Johns Hopkins Medical School The Annual Dinner preceded the meeting

Tioga County

AT THE MEETING of the Medical Society of the County of Tioga at the Green Lantern Inn in Owego on March 2, Dr Conklin of the Robert Packer Hospital, Sayre, Pa gave a most instructive discussion and report of thirty-six cases of undulant fever The disease was discussed by the members and guests from the public health viewpoint as well as from the practioners angle The society voted to support three bills at Albany (1) Provision to remove licensure of physiotherapists, (2) Control of Medical Advertising, and (3) Nurse and Physicians lien bill A postgraduate course for the society is being arranged through Dr Farmer which will consist of five lectures at weekly intervals by members of the Long Island College of Medicine Dr Hyde reported that a joint meeting with the Bar Association of this county will probably be held later in the spring The meeting was reported by Dr I N Peterson, Secretary

Tompkins County

THE MARCH MEETING of the Medical Society of the County of Tompkins was held in conjunction with the Ithaca Civic Forum, on March 4, in Barnes Hall, Cornell University Dr Samuel J Kopetzky, Speaker of the House of Delegates of the Medical Society of the State of New York, was the speaker His address was in answer to one delivered by Prof Goodwin Watson, of Columbia University on "The Socialization of Medicine," before the Forum some time ago Dr Kopetzky gave as title to his speech, "The Point of View of Organized Medicine in Regard to Socialization of Medicine" He said

"The competitive element in American medicine, plus the character of our doctors, has given us the lowest mortality rate and the best system of medical care in the world

"We do not want to see torn down what we have built up, in the quality of our medicine or the education of our students Give labor adequate wages in this country and there will be no need for socialized medicine"

Ulster County

DR CLAUDE E HEATON, assistant clinical professor of obstetrics and gynecology, New York University College of Medicine, at tending Bellevue and French Hospitals, was the guest speaker at a special meeting of the Medical Society of the County of Ulster, held at Kingston on March 2

Warren County

DR REGINALD FITZ of Boston, spoke at a meeting of the Glens Falls Academy of Medicine on March 12 in the Academy Auditorium, on "Insulin-Protamine."

Westchester County

DR LOUIS V WALDRON, Yonkers' third Health Commissioner in seventeen months, died suddenly on March 13 at St. John's Hospital as the result of injuries he suffered Washington's Birthday in an automobile accident at Nyack He was sixty-nine

DR WALTER GREY CRUMP, fellow of the American College of Surgeons and consulting surgeon at the Mount Vernon Hospital, discussed "Appendicitis" at a meeting of the Mount Vernon Medical Society on March 11

Hospital News

Hospital Cooperation in Queens County

AN ORGANIZATION WAS FORMED in April last year known as the Queens County Voluntary Hospital Conference, made up of representatives of the six voluntary hospitals in the county and representatives of the County Medical Society. As reported by Dr H P Mencken in the County Society's *Bulletin*, this group has met regularly each month and is operating under a Constitution and By-Laws. The Conference has agreed upon a certain fixed standard of income under which patients may be admitted to their clinics and be entitled to free services in the hospital. Basically, this plan is the same as that accepted by the Municipal Hospitals of the City of New York. The hospitals have also agreed to avoid self-advertising through press notices, and this particularly applies to their outpatient departments.

The Hospital Conference Group recently met with representatives of the twelve proprietary hospitals of Queens. The Hospital Committee informed the representa-

tives of the proprietary hospitals that they would be required to submit a Medical Board of six members, all of whom shall be members of our County Society. This Medical Board would represent the various departments of medicine and surgery, including one pathologist. It will be the duty of this Board to arrange for monthly staff conferences, maintain adequate case records and be responsible to the Medical Society for the professional conduct and ethics of its institution. Each hospital will be expected to comply with all the requirements as specified by the Department of Hospitals and the Council of Medical Education and Hospitals of the American Medical Association.

Those proprietary hospitals that agree to this plan and conform to the minimum standards outlined, will receive a Certificate of Approval from our County Society for a period of one year and will be recommended to the American Medical Association for registration.

A Word to Nurses—Waste Not, Want Not

A PLAIN TALK WAS GIVEN to an audience of nurses out in Colorado the other day by Dr William S McNary, President-elect of the University of Colorado School of Medicine and Hospitals at Denver. The main theme of his remarks was the need of looking after the hospital supplies with a watchful eye to see that they were not wasted. Don't throw away slices of bread or pour orange juice down the drain, he said, for if everyone does things like that, hospital food costs will mount, economies will be necessary, and the nurse will find her own menu trimmed along with the rest. So chickens and sins will come home to roost.

Sins of the patients have to be watched, too. Some of them have a way of walking off with the hospital linen!

Stealing is a problem in every hospital, especially the theft of linens. For some reason, many otherwise honest persons do not feel it is

wrong to take home towels or sheets or even blankets from hotels and hospitals. It is necessary to replace thousands of pieces of linen which disappear each year. Sometimes it is possible to trace a source of loss and plug the leak. More frequently this is impossible. Try as we will to be careful, things disappear. You will be surprised to know that probably more diapers are taken each year than any other single item. Why? We do not know, but at almost every inventory, hundreds of diapers must be issued to make up for those which have vanished.

Here is a field in which the nurse, more than anyone else, can assist the hospital to save. Teach those under you by precept and example to be economical in the use of linen, to use the proper articles for the proper job. A towel may make a good duster or floor rag, but once so used may be of no further use as a towel. The well run hospital will keep badly stained linen separate. When treating a burn case, or any patient on whom quantities of staining medications are applied, use stained linen whenever possible. Do not

• • •

A CAMPAIGN will start on June 2 to raise \$500,000 to enlarge and modernize the Mercy Hospital at Hempstead, L I. One hundred doctors have pledged support

• • •

THE ISRAEL ZION HOSPITAL in Brooklyn is erecting a new \$600,000 eight-story addition

• • •

THE NEW ROCHELLE HOSPITAL will add a \$400,000, six-story building to its present facilities. The new building will have six operating rooms, one with an amphitheatre for postgraduate surgical instructions. It will also have a children's ward and will provide beds for sixty additional patients

News Notes

Minimum monthly compensation of \$60 for all employees now receiving from \$45 to \$50, minimum of \$62.50 for all receiving from \$51 to \$57, a 7½ per cent increase for all employees receiving from \$60 to \$84, and five per cent increase for all employees receiving from \$85 to \$170

In announcing the increases the Association of Hospital and Medical Professionals pointed out that "no employee of Beth Israel Hospital has ever been dismissed for union activity"

hoard linen against future needs, or you will deprive some other patients of the clean articles they need. Watch for thefts. You do not have to be a policeman, but remember that every sheet, towel, blanket or diaper taken from the hospital means just that much less you have to work with until it is replaced, and that the cost of replacing it takes funds which might install some equipment or labor-saving device which is badly needed in your work.

Extravagance and carelessness are two other sins that turn out to be costly, it appears.

The nurses' biggest responsibility toward supplies, is in their use. The use of two towels where one will do, the syringe laid carelessly on the edge of the table, the hot water bottle dropped in the laundry bag where it may be ruined by steam in the laundry, the expensive instrument treated carelessly, all these and hundreds of other everyday happenings can be prevented by the alert nurse who is interested in doing a good job and saving money for her institution.

The proper use of supplies, the right thing for the right purpose, should be kept in mind.

The maid does not need to use surgical soap to wash her hands, ordinary soap is good enough. Scratch pads are provided for notes, and backs of expensive forms should not be used instead.

Nurses can be of great help in keeping these costs down. Plastering and painting are expensive. A cart or bed rammed into the wall may necessitate doing over a whole room at considerable expense. Much time and money are spent every year repairing doors damaged by the carelessness of those who push linen trucks, stretchers, etc., through them without looking where they are going. Paint can be ruined by improper washing, faucets left only partially closed not only waste water, but must be repaired frequently. Awnings left up in the rain or wind must be replaced. Nurses can help cut down accidents by taking proper precautions in time. Loose shelves may need bracing, an elevator door may be faulty, or a storage cabinet may need to be secured against the wall to keep it from falling on someone. The nurse can help her institution save money and keep a better appearing place for her work if she will cooperate with the maintenance crew.

Improvements

PLANS HAVE BEEN DRAWN for a new three-story brick hospital at Massena, to cost \$130,000 and care for fifty patients.

. . .

A NEW FORTY-PATIENT wing is planned for the South Nassau Community Hospital.

. . .

THE BAPTIST HOME at Fairport has added five new rooms for patients, a nurses' room, diet kitchen, and large glass-enclosed corridor.

. . .

A NEW CITY HOSPITAL to cost \$425,000, not including equipment, is projected at Rome.

. . .

AFTER DRAWING THE FIRE of health authorities for years, the Municipal Hospital at Niagara Falls is to be modernized in a \$45,000 WPA project. Physicians had long termed the present hospital inadequate to the city's needs.

. . .

THE BOARD OF MANAGERS of the Schenectady County Tuberculosis Hospital are

asking for new buildings to house the staff, to cost \$50,000. A year ago the board reported to the supervisors that the buildings for housing male employees, doctors, nurses and women employees "are in almost unlivable condition and should any thing happen through fire or otherwise, the board of managers and the hospital staff cannot be held responsible."

. . .

THE BOARD OF ESTIMATE has authorized the expenditure of \$23,200 to purchase furnishings and equipment for the maternity building at Lincoln Hospital in New York City, which is being modernized as part of a WPA project. The remodeled maternity building, ready for occupancy about May 15, will accommodate seventy-two adults, an increase of forty over the previous capacity.

. . .

BETH DAVID HOSPITAL had a dinner on Feb. 21 at the Commodore Hotel to celebrate the raising of \$75,000 for the equipment of its new building at Ninetieth Street and Lexington Avenue.

. . .

THE BUFFALO COMMON COUNCIL has

Events

MORE THAN 100 mothers from Huntington, Northport, Commack, Greenlawn, Melville and other sections of the town of Huntington honored Miss Emma McIlwain, head of the maternity department of Huntington Hospital for the past eighteen years, with a testimonial dinner at Chateau Maggi, South Huntington, on Mar 11

Nearly 2,000 babies have been born at the Huntington Hospital during Miss McIlwain's period of service

. . .

MEMBERS OF THE BOARD of trustees of the Knickerbocker Hospital gave their annual dinner for members of the medical and

surgical staffs of the hospital and their wives on March 18 at the Ambassador. Plans were discussed at the dinner for the celebration May 23 of the seventy-fifth anniversary of the founding of the institution. The Knickerbocker Hospital was opened in a tent seventy-five years ago to care for sick and wounded soldiers returning from the Civil War. It now provides 50,000 days' treatment each year. For a number of years it was known as the J Hood Wright Memorial Hospital

. . .

THE FIRST ENTERTAINMENT and ball of the Israel Zion Hospital in Brooklyn will be held on May 22 at the Waldorf-Astoria

At the Helm

CLARENCE E WILLIAMS succeeds the late Capt. William G Mayer as president of the Board of Managers of the Utica State Hospital

. . .

MISS EDNA STRACK, assistant superintendent of Tuxedo Hospital for nine years, has been promoted to superintendent.

. . .

DAVID WERBELOWSKY has been re-elected president of Beth Moses Hospital in Brooklyn.

. . .

CHARLES L AUER has been re-elected president of Bushwick Hospital in Brooklyn

. . .

WILLIAM H WALKER, president of the board of Trustees of the Flushing Hospital and Dispensary for the last twenty-two years and a member of the board for twenty-eight years, has retired from the presidency to have more time to study art. Mr Walker, who is sixty-six years old, classifies himself as a student of color

Although he is giving up the hospital presidency to have more time to study art, Mr Walker is no dilettante in the field, he has been a successful professional cartoonist and illustrator for many years

Mr Walker has been a regular contributor to the old *Life* for twenty-six years with social and political cartoons, and his drawings were published in leading periodicals and newspapers

Mr Walker has carried the hospital through many trying financial difficulties. During the 1918 influenza epidemic the facilities were overtaxed, from 1919 to 1926 there was a shortage of nurses because other fields could offer more opportunity. Then the population growth of Queens made added space a necessity. Under Mr Walker the hospital obtained \$823,000 in a drive for funds for an addition and new nurses' home. Then the depression came and it took a skilled hospital administrator to overcome the deficits of the early part of the slump

Now Mr Walker feels he has earned his rest. He will continue, however, as a member of the board

. . .

THE RESIGNATION OF Dr Claude W Munger as director of Grasslands Hospital is announced by the Westchester County Department of Public Welfare. Dr Munger will leave May 15 and become director of St Luke's Hospital in New York. Dr Arthur R. Bowles assistant to Dr Munger, will become acting director pending the appointment of a successor by Miss Ruth Taylor, Commissioner of Public Welfare

HOSPITALIZATION INSURANCE is being considered for Elmira

. . .

EXCESSIVE BILLS BEING PROBED

CHARACTERIZING a \$669 bill charged against a patient for seven days in Kings County Hospital as "an injustice to the public and the profession," Dr Frederic E. Elliott, has turned over to Hospitals Commissioner Goldwater a full report of the case

Dr Elliott, chairman of the economics committee of the State Medical Society, made the disclosure following an Aldermanic committee hearing on two Municipal Assembly bills affecting doctors

Dr Elliott explained that a claim for that amount had been filed by the City of New York in the Surrogate's Court against the estate of a man named Anthony Surfaro following the latter's death in Kings County Hospital. About \$300 of the total, which includes \$527 for surgical services, has already been paid to the city by the estate, Dr Elliott said

In another case, according to Dr Elliott, a patient named Levitan was charged \$678 for fifty-six days in the same hospital. Of that amount, he said, \$302 was for surgical services which also was paid to the city

Dr Elliott pointed out that although the bills were excessive not a single doctor benefited financially from these transactions. He said the State Medical Society favors the amendments, already approved by the Aldermanic Local Laws Committee, which would permit doctors to collect fees in non-indigent cases and those involving workmen's compensation and accident claims where the patient collects damages

Under the present law, all doctors, except a few departmental employees, must work without charge on all types of cases which come into city hospitals

The hearing was attended by representatives of the five county medical societies, including Dr Thomas A. McGoldrick, president of the Kings County Medical Society. All the doctors and Commissioner Goldwater favored the amendments and it was unanimously approved by the committee

Discussing Dr Elliott's revelations following the hearing, a physician said the average doctor would be willing to perform any type of operation and, in addition, stay

night and day with a patient for seven days for one-third of the \$527 charged for surgical services. He pointed out that at the rate of \$669 a week, the yearly total would amount to \$35,000 a year

Dr Goldwater said he would investigate the disclosures made by Dr Elliott.

Dr Goldwater told *The New York Post* that such fees now amount to more than \$600,000 a year. He said that under the present law, the hospital must collect fees in non-indigent cases, but is not permitted to compensate doctors

Not all of this money represents doctors' surgical and medical care, but estimates have been made that more than half, or about \$300,000, represents fees charged by the Department of Hospitals for services given free to the city by doctors

. . .

A MERGER OF THE two largest Jewish welfare bodies in New York City is contemplated, embracing ninety-one institutions in Manhattan and the Bronx and twenty five in Brooklyn. The New York Federation group includes seven large hospitals, among them Mount Sinai, Hospital for Joint Diseases, Montefiore Hospital for Chronic Diseases and Beth Israel. Included in the Brooklyn group are the Jewish Hospital of Brooklyn, Beth Moses Hospital and the East New York Dispensary, together serving 80,000 patients annually

. . .

THE NEW YORK CITY DEPARTMENT OF HOSPITALS ANNOUNCES that 325 vacancies in internships in thirteen general hospitals throughout the City were filled through examinations just completed

Applications for the 325 internships were filed by 3,858 individuals. Of the 325 appointed, 253 presented A.B. or B.S. degree diplomas. In addition, twelve of the appointees hold Masters' Degrees and two are Doctors of Philosophy

Five medical colleges contributed 183 of the new interns, eighty-seven coming from Bellevue, twenty from Cornell, twenty-eight from Flower, twenty-one from Long Island, and twenty-one from Columbia. Of the internships, 225 were combined medical and surgical appointments, forty-one were medical, twenty-three surgical, twenty-four special, ten psychiatric, and two pathological appointments

where it is his interest to exaggerate. If he were to explain to those whom he is to influence that he is acting under such an employment, and as a solicitor, then there would be nothing to put him on a different footing than other known agents. But no such explanation was contemplated, and none given. And however honest a man's actual intentions may be, and however truthful he may be, there is a direct temptation to misrepresent, and a direct danger that the misrepresentation will operate injuriously to the parties dealt with. Such secret agreements by persons putting themselves in positions of confidence come within recognized prohibitory rules as tending to defraud. In such cases we cannot expect to find precisely analogous precedents, but the principle is familiar and of long-standing. It belongs with the class of combinations to raise prices by biddings at auctions, or other devices whereby the illegality is not worked out merely by success, but inheres in the transaction itself, and with those contracts where success is dependent upon personal influence and persuasion, having the appearance of disinterestedness.

Operative Treatment of Diverticulum

A doctor who specializes in surgery was consulted by a man with complaints of difficulty in swallowing. A complete physical examination led to a diagnosis that the patient was suffering from a pulsion diverticulum of the esophagus interfering with swallowing since food accumulated in the said pouch. The doctor performed an operation upon the patient exposing the diverticulum and changing its direction by displacing the sac upwards instead of downwards. He felt that such a procedure was more advisable rather than the complete removal of the diverticulum. Following the operation the patient's recovery was good with the exception of a slight complication known as a Horner syndrome on the left side consisting of a slight droop of the eyelid, a contraction of the pupils, and an insignificant recession in the eyeball. This, the doctor determined, was due to some disturbance in the sympathetic nerve of the neck unavoidably caused in the course of the operation.

The doctor subsequently instituted an action against the patient to recover his fee for professional services rendered. A counterclaim was interposed, based upon alleged malpractice and breach of contract. The particular claim was made on behalf of the patient that the complication referred to was caused by the doctor's negligence and that the doctor had failed to carry out his contract when he operated upon him, since he did not remove the diverticulum

but merely altered its position. The case was tried before the Court and jury and at the conclusion of the testimony on behalf of the defendant-patient, the plaintiff's motion to dismiss the counterclaim was granted and judgment was directed in favor of the doctor in the full amount of his bill.

Treatment of Asthma

A married woman about thirty-five years of age consulted a doctor specializing in internal medicine with respect to a condition of asthma which she stated to the doctor had troubled her for about ten years. The doctor examined her and put her through a series of tests which included a scratch test with the instillation of food solutions. He made an examination of the patient's blood. The patient sustained no ill effects from any of the tests which the doctor made. Upon the completion of his examinations, he instituted treatment consisting of a series of injections of auto-genous vaccine prepared from sputum. The injections were made in the patient's arms and legs and continued from time to time for a period of nearly two years. The asthma improved considerably but, at the end of that time, the patient informed the doctor that she was going to Florida. He told her that he believed that she should continue treatment in Florida and gave her a letter containing a history of her case in order that some other doctor could be in a position to continue the same type of treatments that he had been using.

The next the doctor saw of the patient was about ten months later when she returned complaining of pain in her leg. Examination showed no objective symptoms but since she complained of pain while walking he had x-rays taken of the region and the reports led to the conclusion that a foreign body which had the appearance of lipiodol was lodged in the tissues of the patient's right buttocks. The doctor suggested an operation for the removal of the condition but the patient would not consent. He thereupon suggested physiotherapy and a few such treatments were administered to the patient. She discontinued returning to the doctor and instead commenced a malpractice action against him charging that he had been negligent in administering injections to her and had caused her to sustain the painful injuries of which she had complained. At no time had the doctor administered lipiodol.

Before the action was reached for trial, the plaintiff died thereby abating the action and finally disposing of the same.

LORENZ J BROSNAN, ESQ

Counsel, Medical Society of the State of New York

Compensation of Physician Contingent on Outcome of Litigation

Recently a case came before the highest Court of a nearby State in which the question presented was the validity of an agreement made by a physician that his compensation for treating a patient was to be contingent upon the recovery in a suit for damages.*

The matter arose when a woman named M sustained certain serious injuries in an accident which she subsequently claimed was caused by the negligence of another Dr W was called to attend her with respect to those injuries. She was not able to pay cash for the medical care and attention required, so at the beginning of their relations, an oral agreement was entered into between M and the doctor whereby he would attend her throughout her period of disability and in return would receive twenty per cent of the verdict received by her from the person who caused the injuries. It was also agreed that if the verdict went against the patient, the doctor would receive no pay. Under such an arrangement the patient remained under the care of Dr W for more than two years.

When M's damage suit was about to be reached for trial she protested against her liability under the alleged contract, and was extremely reluctant to go ahead with the trial. The doctor urged her to go through with the case, threatening suit against her if she dropped the case. He, at that time, offered to withdraw from the arrangement if M would pay him a certain fee for the services he had rendered, but the offer was declined.

The negligence action was tried before a jury and resulted in a verdict in favor of M of \$7,200. Dr W testified upon the trial as M's witness and was of further assistance to her case by obtaining for her the testimony of another medical expert witness.

Thereafter Dr W tried to collect the twenty per cent agreed upon at the beginning of his care of M, and brought an action against her to recover the sum of \$1,440 with interest.

When the case came up for trial before the Court without a jury the material facts

were shown to be substantially as outlined above. The Court made a finding that the agreement was one which from the outset contemplated that Dr W would testify on behalf of M when her case came up in the future. Judgment was directed in favor of the defendant which was confirmed by the higher Court.

It was pointed out in so deciding that the facts present a case where a champertous agreement had been entered into (Champerty has been well defined as "the unlawful maintenance of a suit in consideration of some bargain to have part of the thing in dispute or some profit out of it, where upon the champertor is to carry on the party's suit at his own expense.") The Court ruled that the agreement was against public policy and void, and cited an earlier decision,* from which the following quotation well summarizes the problem:

When we come down to the real nature of this alleged contract, it is one which contemplated that plaintiff was to give his view of the facts relating to defendant's physical condition and injuries, as they had existed and been developed under his observation, and the medical bearing of these facts, and the extent of past or future dangers and sufferings. While it is probable, from the medical testimony, that the present condition and future prospects can be got at with considerable certainty, yet it is also possible that some complications may escape detection, and some appearances may be ambiguous, unless explained by previous symptoms or conditions. Beyond this there can be no doubt that suggestions may often be made by one physician which will and others, to whom they might not have occurred from their own experience or observation. Under these circumstances, it is at least possible, if not probable, that the judgment ultimately formed will depend very much on the facts and opinions and the coloring of the statements furnished by the person relied upon as best informed. He puts himself in a position where both parties are expected to rely upon him and to act upon what he says.

When under such circumstances, he makes the disclosure of his knowledge and opinions the subject of a contract, whereby his compensation is to depend on the amount obtained by his employer by reason of the disclosure, it is plain that he puts himself in a position

* Weinberg v Magid, 189 N E 110

* Thomas v Caulkett, 24 N W 154

meetings like to see them in print. "We condense them as needed, and allow for them thirty to fifty per cent of the total pages of printed matter," says Dr Buckman. "We never slight one whose manuscript is submitted. This is of prime importance in our society." Another editor goes still further. Dr George Hay, editor of the Cambria County *Medical Comment*, prints pictures and sketches of all new members, thus giving them a warm hand of welcome, and identifying them to the older members. He also presents pictures of other members on occasion, with items of interest, and prints cuts and obituaries of those who die. The members thus receive hail and farewell, and an occasional pat on the back along the way.

"No jokes," says Dr Hay, for "we believe a scientific journal is no place for levity." Dr Seabold, however, thinks that "one page of medical humor will very often hold the bulletin on the member's desk a few days longer," and Dr Parker grants that "it does no harm to inject a little humor now and then into the bulletin." Tastes differ, thanks to whatever natural or divine force shook up the human cocktail of desires, emotions, aspirations and what not. As Eugene Field wrote

De gustibus, tis stated, *non disputandum est*,
Which meaneth, when translated, that all is
for the best.

How the trick of getting out a county bulletin is done is told in a few words by Dr Parker. As he relates it

To facilitate the work, it is divided. Dr Wallace W Dill takes care of personal items. He gets the news, and he has the material in on time. Dr Herbert A Bostock reports meetings. His job is to take notes or obtain manuscripts if possible. He also is reliable and prompt. The minutes of our meetings are always sent promptly by our secretary. With two members of the committee functioning so admirably the third member, the editor, has only to place the material properly, add valuable clippings from other periodicals, write an editorial putting the "bull" into the bulletin so to speak, supply it with horns, and see that it is fed properly.

"Inspiration" and "Perspiration" Do It

As our eavesdropper cocks an ear to catch the next item of the Pennsylvania famlv powwow, the State Secretary, Dr Donaldson, calls upon Dr Arthur B Flem-

ing the Schuylkill County Secretary, to explain the kind of magic he uses to secure and hold new members. He refers to Dr Fleming as to a "go-getter."

In reply, Dr Fleming says "Here's the prescription, Inspiration—one part, perspiration—three parts." He would have us feel that it's all perfectly simple. The "inspiration," it seems, consists in studying the local papers for items about the prospective member, which are clipped and filed. The prospect's medical school and birthday are carefully noted. "When friend physician becomes a fond papa for the first or fourth time, remember to send greetings. But when he gets somewhat elated on New Year's eve at the country club—hits a telegraph pole, doing damage to himself and the car—forget it."

Then comes the "perspiration." Hard work is necessary, declares the "go-getter" of Schuylkill County. And this is how he does it.

Having learned something of our prospect, his home life and the field in which he lives and works, we are ready for our contact or contacts.

We have tried to have him attend one of the most worth-while meetings of our society via one of his medical neighbors already a member of organized medicine. If he accepts, the ice is broken and usually the rest is easy. He may go of his own accord to some other nearby, out-of-our-county meeting, where we can become just a little better acquainted.

We have dropped in to see him when passing through his town. We know his wife and she tells hubby who called. Sooner or later we get him at home in a good humor, answer his questions and objections, and he signs on the dotted line.

Does this satisfy him? Not at all. The end of the year, March 31, soon approaches, and the new member has not come across with his dues. In fact, he is one of fifty or sixty who are delaying. They are scattered all over the county. So our go-getter sets aside two or three hours every possible March afternoon and drives out one way today and another tomorrow, mapping his route in advance and calling on the phone to clinch the appointments. Few delinquents escape. It is said of some salesmen that they could sell snow shovels in a certain warm locality. The Schuylkill County folks seem to have secured one of that tribe for secretary.

Across the Desk

"Listening in" to a Sister State

EAVESDROPPING ON THE NEIGHBORS is perhaps permissible when the neighbors hold their family confab, so to speak, out on the front porch with all the lights turned on. The secretaries and editors of the Pennsylvania county medical societies have been doing something just about like that. They have come right out in print and told how they run their county *Bulletins* and what they do to make their county meetings go successfully. They can hardly blame us then, if we overhear what they say, and pass it along to our secretaries and editors here. The "eavesdropper" is supposed to get the drippings from the roof down the back of his neck, but, instead, we get a few useful hints that may perhaps prove of value to some of our county organizations.

Old Argument Takes Haywire Aspect

No one can look out over the medical activities around our own State without noticing the growing number of county *Bulletins* that mirror the doings of their various societies. They are not only growing in number, but in size and excellence. It would seem inevitable that other counties are debating with themselves the advisability of launching similar sheets. The usual objection is that "we can't afford it, it wouldn't pay, and someone would have to shoulder the deficit, who would do it?" That is usually a silencer. Well, as we listen in on our Pennsylvania friends, we hear a report from the Lebanon County editor, Dr. Paul S. Seabold, that seems to knock that argument into a cocked hat, if the expression may be pardoned, or shiver it to smithereens, if that is any better.

The Lebanon County society has but forty members. It is a sparsely settled county, with only one good-sized town, Lebanon, with some 25,000 population. But last year the society got out a sixteen page monthly bulletin, half reading and half advertising, which not only paid for itself, but made "a profit sufficient to pay the expenses of all the social features of our stated meetings." Encouraged by this feat,

the society has increased the magazine to twenty pages, and expects it to take care of the entertainment expenses of the society for the year.

Nor is that all. Dr. Seabold had the printer get out one of those old-time pointing hands, and says

"The attendance at the meetings of the Lebanon County Medical Society was increased 150 per cent in less than 6 months after the first issue of *The Bulletin*."

His explanation of that is that a postcard announcement or even a formal letter, if read, is thrown into the waste basket and in a few hours is forgotten, while a publication of from eight to twenty pages, with the meeting announcement on the cover, is usually not discarded, and remains on the desk as a constant reminder of the coming meeting and program.

A friendly tip on advertising is quietly confided by Dr. Frank C. Parker, Editor of the Montgomery County *Bulletin*. Advertising was formerly "a nightmare," he confesses—"we could not collect." But now, "since turning all the advertising over to the Woman's Auxiliary, the net income to go to the State Society Benevolence Fund, we have more advertisements than ever before, and the women are excellent collectors."

Does this bear out Kipling's dictum that "the female of the speeches (or is it species?) is more deadly than the male?"

Of, by, and for the County Society

The county publication "should be a family-circle affair," says Dr. Parker, and that seems to hit off, in a phrase, the feeling of all the Keystone county editors. It should be of, for, and by the county society. The important things, declares Dr. Buckman, of Luzerne County, are the questions of purely local interest. The *Bulletin* tries to bring the members to the meetings, but many of course find it impossible to come, its duty then is to take the meetings to them, by adequate and interesting reports.

Members, too, who read papers at the

The Oxford Medicine By Various Authors Edited by Henry A. Christian, M D Volume 7, Psychiatry for Practitioners Quarto of 634 pages New York, Oxford University Press 1936 Cloth, \$10 00

Psychiatry for Practitioners by Various Authors Edited by Henry A. Christian, M D [Reprinted from Oxford Loose-Leaf Medicine.] Octavo of 646 pages New York, Oxford University Press, 1936 Cloth, \$6 50

This work of 646 pages forms volume 7 of the "Oxford Medicine" series edited by Dr Henry M Christian of Harvard. It consists of monographs by a group of eleven eminent psychiatrists including such names as Earl Bond, professor of psychiatry at the University of Pennsylvania, Clarence O Cheney, professor of psychiatry at the College of Physicians and Surgeons, New York, D K. Henderson, professor of psychiatry at the University of Edinburgh,

Eugen Kahn, sterling professor of psychiatry at Yale University, and William A White.

The volume is entitled "Psychiatry for Practitioners," but the reviewer respectfully submits that it would have been better to leave the practitioners out, as most of the contributors write clean over the head of the average general practitioner of medicine, repeatedly using highly technical terms without explanation or definition, terms that would be entirely devoid of meaning unless one had made a considerable study of psychiatry. A notable exception to this criticism is Dr T A Ross of London, England, whose article on the psychoneuroses shows evidence of having really been written for the general practitioner. Besides being extremely technical, most of the monographs are too detailed for the man who is interested in psychiatry only as a side line. As an example of

To Each According to Its Need

When it comes to programs for the county meetings, it can only be said that every county society knows its own needs best, and what is good for one may not be the thing at all for another. Lycoming County goes in for the best scientific programs it can afford, with two all-day clinic meetings in the spring and fall. "It requires money to carry out such programs, but it is a fine investment," reports the Secretary, Dr. Brenholtz. "Make your society's annual dues sufficient to provide good scientific programs."

Another county finds that the discussion of everyday problems is more suited to its membership. Says Dr. Perrine, of Mercer County:

Since the membership of small county medical societies consists largely of general practitioners, programs must converge on their interests.

The general practitioner is interested in the solution of the most common problems in medicine. He has only an academic interest in rare and unusual conditions. He does not care for long reports on research or laboratory subjects.

It is the *Pennsylvania Medical Journal* that affords this intriguing glimpse into the machinery of the county publications and programs, and if other state journals followed the example, we might have a nationwide "experience meeting" that would be helpful all around.

GERMANY'S TREATMENT OF ALCOHOLICS

What is probably the simplest treatment of chronic alcoholics in the world is found in Germany by a European survey made by Dr. Robert Fleming, of the McLean Hospital at Waverly, Mass., under the Rockefeller Foundation, and reported in the *New England Journal of Medicine*. Says Dr. Fleming:

For all practical purposes there is only one therapeutic approach to severe chronic alcoholism in Germany today, and that is the surgical approach—sterilization. To understand how this state of affairs has come about, it is necessary to realize the extent of the ideological reorientation that has taken place and to appreciate the historical events that have made that reorientation a national psychological necessity—a discussion somewhat beyond the scope of this report.

In Germany the community and the race are everything, whereas the individual is only the bearer and the transmitter of a quantum of "Aryan blood" upon the "purity" of which the destiny of the German people is supposed to depend. This essentially biologic orientation logically justifies the sterilization of those

drunkards whose alcoholism is derived from hereditary defect, and constitutes a long range point of view, the object of which is prevention rather than treatment.

Beyond this, it is a matter of relative indifference whether the individual drunkard, after having been rendered incapable of transmitting his 'drink-causing' taint, quietly drinks himself to death. As stated by Dr. Skalweit of the University of Psychiatric Clinic at Rostock, "Surely it can be of no moment to us if the really incurable habituated alcoholic, as he is designated by the Law for the Prevention of Hereditarily Diseased Offspring, finally succumbs to liver, kidney or other organic damage—indeed, we can most earnestly wish that this end should come early instead of being irrationally postponed by ever repeated institutional efforts at therapy which only lead to backsliding immediately after discharge."

With this general shift in orientation that effects the thorough subjugation of the individual to the supposed biologic interests of the community as a whole, there has resulted an almost complete dissolution of the facilities, built up so laboriously during the past half century, for treating individual drunkards.

FORE!!

The Entertainment Committee for the forthcoming meeting of the State Society is planning to feature golf to an unusual degree. Although each contestant will play but eighteen holes of golf, it will be possible for him to take part in innumerable contests, for all of which interesting prizes will be offered.

Team matches between various cities will be one of the attractions. Syracuse doctors have already been challenged by Rochester and Buffalo, and will probably have to battle with Utica.

At the same time teams from the large cities of the State and Ontario will endeavor to win the valuable Lilly Trophy.

The student will find that this book contains an answer to most questions on physiological chemistry and metabolism, even including a description of protamine that we hear so much about in relation to insulin at the present time.

MORRIS ANT

Keeping Your Child Normal Suggestions for Parents, Teachers and Physicians, with a Critical Estimate of the Influence of Psychoanalysis By Bernard Sachs, MD Duodecimo of 148 pages New York, Paul B Hoeber, Inc, 1936 Cloth, \$1 50

This is one of those common-sense books. The author knows psychoanalysis, he knows "sex" and that it is important in life, he devotes enough attention to it to emphasize that it has often received too much, and improper attention.

The rest of the little book is devoted to the general care of children from the psychic side and it is heartily recommended especially to mothers who fear that their more or less normal offsprings are going astray in morals or habits.

WALTER D LUDLUM

Synopsis of Ano-Rectal Diseases By Louis J Hirschman, MD Duodecimo of 288 pages, illustrated. St. Louis The C V Mosby Company, 1937 Cloth, \$3 50

This "Synopsis" is based upon an earlier work entitled "Handbook of Diseases of the Rectum" with fewer pages and illustrations. The book contains a clear description of proctologic procedures and operations which may, for the most part, be carried out in the office.

For anyone who feels the need for a rapid review of rectal procedures the book may be recommended.

CHARLES GOLDMAN

Illustrious Contributors to Public Health. Being the names carved on the new building to house the Departments of Health, Hospitals and Sanitation, and the Office of the Chief Medical Examiner. A Souvenir prepared for the Dedication Exercises on Tuesday, November 26, 1935. By Charles F Bolduan, MD Octavo of 33 pages, illustrated. 1936 Cloth.

The new building of the New York City Department of Health has carved on it the names of twenty-nine prominent sanitarians in the history of the world extending from Moses to modern leaders such as Biggs and Gorgas.

Even men of wide public health experience have had difficulty in identifying some

of these engraved names, and Dr Bolduan has performed a service in presenting in pamphlet form a brief description of the life and deeds of each man in so far as they relate to sanitary matters.

It is made up in attractive style and is very much worth reading.

ALFRED E. SHIPLEY

Treatment in Psychiatry By Oskar Diethelm, MD Octavo of 476 pages New York, The Macmillan Company, 1936 Cloth, \$4 00

The average book on psychiatry is a general exposition on the subject in which therapy is but briefly outlined. The book under discussion deals essentially with treatment of conditions that are grouped under the general heading of psychiatry. It is based on the teaching and methods of treatment as outlined by Dr Adolph Meyer. Throughout the book one sees the influence of the author's teacher who has played such a prominent role in American psychiatry during the last quarter of a century. The subject matter is grouped according to symptoms rather than disease entities. The treatment of the patient as a whole is stressed throughout. All forms of psychotherapy are discussed and evaluated. Physical and chemical forms of therapy are given due credit. Throughout the book one is impressed with the thoroughness and the humane approach which the author has employed in dealing with the mentally sick.

It is an excellent book, based on a rich experience—and could have been written only by an extremely intelligent and humane physician. It merits all praise that could be given to it.

IRVING J SANDS

Skin Diseases in Children. By George M MacKee, MD & Anthony C Cipollaro, MD Octavo of 345 pages, illustrated New York, Paul B Hoeber, Inc., 1936 Cloth, \$5 50

This is a book of great value, especially for those practicing among children. The author has so detailed and illustrated the common skin ailments of infants and childhood that it makes it seem a simple matter to diagnose most of them. Differential diagnosis, which is such an important phase of dermatology, is intertwined within the text so as to be of the greatest aid. Treatment is superb, prescriptions are given and for a specific reason, and yet not too many, or of the shotgun variety. This book is already being well received, and no wonder.

THURMAN B GIVAN

what we mean, the writer of the most excellent article dealing with the manic-depressive psychoses, devotes nine pages to a historical discussion of the disorder. There is present another fault which frequently occurs in works of this nature, overlapping. The first 132 pages of the book are devoted to a chapter entitled "The Beginnings of Mental Disease", the writers cover virtually the whole field of psychiatry, the remainder of the book is taken up by more detailed articles covering largely the same ground.

To summarize, the work is an extremely valuable one, representing as it does, the thought of some of our ablest psychiatrists, but, as stated above, the reviewer feels that it will be much more valuable to the psychiatrist than to the general practitioner.

The publishers have issued this work in a separate book making it available in this form for those who are not subscribers to the *Loose Leaf Medicine*.

F C EASTMAN

An Introduction to Materia Medica and Pharmacology By Hugh A. McGugan, M.D., and Edith P. Brodie, R.N. Octavo of 580 pages, illustrated. St. Louis, The C. V. Mosby Company, 1936. Cloth, \$2.75.

This book, in its first edition, is the outgrowth of attempt to revise the fourth edition of Brodie's "Materia Medica for Nurses". It covers both elementary and advanced materia medica, such as the nurse will find valuable in her work. It is ideally adapted to requirements of training schools as a textbook, being concise, comprehensive, and devoid of material unessential for a proper grasp of this important subject.

The book is based upon new editions of the United States Pharmacopoeia and the National Formulary which is commendable, and, in addition, much new material has been added from pharmacological and clinical fields. There are seventy-one text illustrations and eighteen color plates explanatory of the text, especially in relation to the circulatory and nervous systems.

The authors have presented a textbook that is worthy of high praise, and deserves a place in the library of all nurses who desire a modern reference book on this subject.

FREDERICK SCHROEDER

Text-book of Pathology By Sir Robert Muir, M.D. Fourth edition. Octavo of 994 pages, illustrated. Baltimore, William Wood & Company, 1936. Cloth, \$10.00.

The fourth edition of Muir's Textbook of Pathology maintains the general excellence of the preceding antecedents. As a text-

book the contents conform to views generally expressed, without departing from an element of originality of ideas which is stimulating to thought. Terminology is handled in an admirable manner. The tendency of writers in pathology to devise individual nomenclature is compensated for by an alternative designation which regularly clarifies the text. Much confusion is thus avoided. The arrangement of material is satisfactory, and the illustrations are many and well done. The author has included extensive chapters in the latest developments in the field, including biochemistry, immunity, allergy, and endocrinology. As a whole, the book is one that can with out effort be highly praised, and for which, without flattery, the author is to be commended. No pathologist or earnest student of medicine can read it without profit.

MAX LEDERER

Pathology of the Nervous System A Student's Introduction. By J. Henry Biggart, M.D. Octavo of 335 pages, illustrated. Baltimore, William Wood & Company, 1936. Cloth, \$5.25.

Detailed information of pathological processes affecting the nervous system ordinarily is brief in general textbooks. This volume was constructed as an adequate survey of neuropathology without losing contact with the general field or becoming a compendium. The subject is divided into etiological divisions where possible, and according to anatomic changes otherwise. The general style of presentation is clear, terse, and factual. The material is more than usually inclusive of recent entities and hypotheses. References are mostly to monographs and are limited to English. The illustrations are all new and excellent. The book is highly recommended for the special student and as an up-to-date handy reference in the subject.

IRVING M. DERBY

Principles of Biochemistry By Albert P. Mathews. Octavo of 512 pages, illustrated. Baltimore, William Wood & Company, 1936. Cloth, \$4.50.

Dr. Mathews has rearranged, and completely rewritten his old text so that it has become a new work in every sense of the word. It is concise and covers all new features of biochemistry, particularly those pertaining to nutrition. He discusses the metabolism of essential body elements including vitamins. The descriptions are clear and concise. The book also contains structural formulas of hormones and amino acids as they are known today.

PREVENTION OF CONGENITAL SYPHILIS

GEORGE F HOGAN, M D, *Brooklyn*

Physician-in-Charge, Social Hygiene Clinic

It is the consensus of opinion that congenital syphilis can be prevented with adequate treatment before the fifth month of pregnancy in the vast majority of cases. This has been proven beyond all question of doubt.

No physician should withhold antiluetic treatment from a syphilitic pregnant woman, even if asymptomatic, for should the child develop manifestations of the disease it would be difficult to accept such a grave responsibility.

Every family physician and prenatal clinician should never neglect to take a careful history and physical examination, including a Wassermann test, on all pregnant women before the fifth month of gestation.

Syphilis is known as the great impersonator, it has no respect for age, color, creed or station in life, it may be dormant in the various tissues of the body, waiting its opportunity to strike and produce a devitalization of an important organ or tissue of the body. After this vital tissue has been destroyed, who can replace it?

No one wishes to see a child entering puberty or adolescence displaying evidences of the disease and denied the privileges of living a normal life, barred from marriage and propagation. But these children exist in vast numbers, they are here—living amongst us and in institutions—ghastly examples of human indifference and neglect.

We institute modern therapy for their welfare—but with what a sacrifice! It is highly gratifying to know that the authorities in power today have instituted an intensive campaign to stamp out the communicability of the early stages of the disease. Of equal importance, if not greater consideration and action should be instituted in eradicating congenital syphilis.

Let us forget for a moment the latent acquired cases which demand so much of our time and energy. Every mother wishes to give birth to a healthy normal child, free from any disease or stigmata. No greater shame could befall a woman who is sincere in the matter. We must do everything in our power to prevent such a tragedy.

Quoting from Dr Mulots' article¹ on "Syphilis in the Pregnant Woman" he states:

The still birth or the child that dies within a few hours after its birth is a tragedy to that mother. She has cheerfully borne all the discomforts of the pregnant state and has willingly forfeited many of the pleasures that that state forbids. She suffered the pains of labor and in the end, only to bring forth a dead child to be laid away unnamed. This is the bitterest, most tragic disappointment that can befall a woman. She is entitled to our warmest sympathy, her case is something to which we may well give our earnest thought and study, that we may save others from a like experience and her from a repetition of the catastrophe.

Corrections in 1937 Directory

The Journal Management Committee of the Medical Society of the State of New York under whose supervision is published the Medical Directory of New York, New Jersey and Connecticut, as well as the NEW YORK STATE JOURNAL OF MEDICINE, here supplies, *for the first time*, corrections in the Directory designations that have been received up to April 1, 1937. The Committee suggests that these be clipped from this page and pasted into the Directory on the pages indicated.

woman is capable of absorbing the treatments with very little disturbance to the heart, liver or kidneys. It is better, however, to reduce the amount of the drug used in order to avoid any reactions or complications.

The Syphilis Clinic Committee of the New York Tuberculosis and Health Association and Bureau of Social Hygiene of the Department of Health have advocated the weekly injections of bismuth and one of the arsphenamines continuously during the entire pregnancy. These women must be treated with kindness and consideration, try to establish their confidence, use small gauge needles both for intramuscular and intravenous therapy. The outcome depends upon the proper management of the case as these women may lapse in their treatments or discontinue them altogether, due to some disagreement or reaction from the injections.

These women must be impressed with the fact that regardless of how they feel and regardless of the result of their blood test, that treatment is necessary during every succeeding pregnancy, in order to insure a normal child free from stigmata. They must be impressed with the fact that even though the child has been apparently normal, the condition of the disease may be latent and it is therefore necessary for the child to have an examination and blood test every year until puberty.

In a clinical study of 2150 pregnant syphilitic colored women, McCord⁸ found that regardless of the activity of the disease, sufficient antipartum treatment assures a syphilis free-baby in ninety-five per cent of the cases.

At the Social Hygiene Clinic of the Department of Health in Brooklyn, a clinical study of 336 case records of syphilitic mothers has been undertaken to substantiate all previous deductions and claims. Most of the women selected were multipara, diagnosed as cases of latent syphilis. Of these 336 mothers, an aggregate total of 1179 pregnancies were tabulated. 192 of the mothers were white and 144 were colored. On admission to the clinic, 328 were in the latent stage whereas eight were in the secondary stage. Of the 1179 pregnancies, 102 were treated adequately before the fifth

month of gestation, in which five terminated in miscarriages.

The viable births resulted in ninety healthy babies whose Wassermann tests, physical examinations, and x-rays of the long bones were negative. By adequate treatment we mean the treatment received from the fourth month to term, and in those cases who have been treated previously—say from eight to twelve months.

At least twelve injections of arsphenamin or its derivative and twelve injections of a bismuth or mercury preparation may be considered as a minimum for adequate treatment. This amount may be adequate to prevent the transmission of the disease from the mother to the fetus, but not sufficient to cure the syphilis in the mother.

There were seven viable births in which a diagnosis of syphilis was made by either a positive Wassermann test, physical examination or x-ray of the long bones. On taking the histories of these women it has been found that ninety per cent of them denied any knowledge of contacting a primary lesion or developing any secondaries. This may be easily explained by the fact that the primary lesion may have been cervical, and as the disease runs a milder course in women than in men, the secondary manifestations may have been very mild or possibly did not appear.

Usually a few weeks to a month after confinement, the mother is instructed to bring the child to the clinic where a careful examination is made of the child for the early signs of congenital syphilis. The blood is obtained by the syringe method, using a small gauge needle from a branch of the external jugular, or possibly from the wrist or forearm. The child is next referred for an x-ray of the long bones where evidence of osteochondritis, chondroepiphysitis, periostitis, and osteomyelitis may be present. Any one positive finding in this series of examinations stamps the child as being a case of congenital syphilis, and appropriate measures are then undertaken to institute therapy. As there were seven cases who were diagnosed as congenital syphilis, even after adequate treatment, a review of the histories and examinations revealed that the seven were diagnosed syphilitic on positive blood Wassermann

This has been substantiated many times at the various prenatal hospital clinics. It seems incredible that the great majority of the pregnant women, who have been admitted to the Brooklyn Social Hygiene Clinic for antileptic treatment, have been in the fifth, sixth, seventh or eighth month of their gestation.

Unfortunately, the majority are primipara—without any previous antileptic treatment. This is probably due to the fact that most married women wait until the sixth, seventh or eighth month before they seek medical advice or make arrangements for their confinement. Probably negligence, fear, ignorance, economical circumstances, or a feeling of good health usually interfere with the seeking of a medical examination in the early months of their pregnancy. It will be very difficult indeed to change this state of affairs unless we can possibly get the cooperation of the members of women's clubs, societies, nurses and doctors of prenatal clinics, through radio broadcasting stations, articles in newspapers and magazines.

It would be a difficult task for any state to legislate certain laws that could be used as a standard in determining the fitness for marriage of any syphilitic. The negative blood Wassermann is absolutely untrustworthy, and what are the possibilities of transmitting the disease to her offspring in cases who have had adequate treatment but where the blood Wassermann returns positive.

Even if the applicant presents a negative blood Wassermann report to the marriage license bureau, the person will conceal the fact of having had the disease, even on affidavit.

According to Stokes,² the average male patient should reach a noninfectious condition within five years, any extended clinical experience soon demonstrates that women in particular may violate all-time rules with reference to the transmission of the disease to children.

In the United States, nineteen states make venereal diseases a bar to marriage, but provide for little more than the statement of the applicant as to his freedom from them before marriage. Ten states provide penalties for the marriage of a person knowingly infected with a venereal disease, the offense ranging from a mis-

demeanor to a felony. The marriage of persons with venereal disease is void in Utah and grounds for annulment of marriage in that state, also in New Hampshire, Michigan, Vermont, and Wisconsin.

The consummation of marriage between two individuals should interest the state as much as any one concerned. According to Stokes, the evidence of syphilis in the child population, as a whole, ranges from three to five per cent. The Solomon's summarized estimates range from 17 to twenty-two per cent. Jeans noted that in St. Louis fifteen per cent of colored infants, 18 per cent of poor whites and less than one per cent of infants in well-to-do families had the disease. The state should be interested by such figures.

When we know that congenital syphilis can be prevented, why do we have our institutions crowded with the innocent victims of negligence, the blind, paralyzed, and insane? The state could appoint an examining board of physicians for each district to pass upon the eligibility of each candidate for marriage.

They should be physicians who are experienced in taking careful histories and physical examinations and taking the necessary tests for the determination of the presence of a venereal disease. All doubtful cases could be referred to a higher Board of Appeals for a disposition.

This would mean a control over cases which need certain guidance and a restraining influence. It would be necessary to make it clear to every individual afflicted with syphilis that he or she would not be barred from marriage or in having children, provided they would cooperate and abide by the decision of the Board of Physicians in taking treatment.

There is on record at the Social Hygiene Clinic in Brooklyn over one thousand cases of congenital syphilis who have been treated during the past ten years. Every phase of stigmata has been noted in these children—some blind, deaf, tabetic or parietic, others with interstitial keratitis, bone and joint involvement, nose and throat deformities, skin and glandular conditions, early and late manifestations. At least eighty-five to ninety per cent of this could have been avoided.

It has been noted by many syphilographers that the pregnant syphilitic

stigmata These are the children who are being treated today, but let us hope that with adequate treatment, even extending over a period of years that it may offer some degree of security by preventing any future outbreak of symptoms or stigmata

In conclusion, consider every syphilitic woman in the child bearing period as having potential possibilities of trans-

mitting the disease to her offspring, and immediately institute the required therapy at the first sign of pregnancy, regardless of the Wassermann, previous treatments, and symptoms

CANCER COUNCIL TO GIVE PUBLIC ADVICE

Dr C C Little, managing director of the American Society for the Control of Cancer, announces the organization of a Cancer Council, as a clearing house of information on combating the disease, to be given to the public through scientific writers in the lay press

The council, which may be enlarged later, includes Dr Frank Adair, of Memorial Hospital, appointed by the regents of the American College of Surgeons, Dr Karl Koenblum, appointed by the president of the American Roentgen Ray Society, Dr James B Murphy, of the Rockefeller Institute for Medical Research, Dr Little, of the Roscoe B Jackson Memorial Laboratory at Bar Harbor, Me, appointed by the Council of the American Association for Cancer Research, Dr James Ewing, of Memorial Hospital, and Dr Burton T Simpson, of the State Institute for the Study of Malignant Disease, at Buffalo, appointed by the directors of the American

Society for the Control of Cancer

"The Council," Dr Little said, "is an important step forward in establishing frank and friendly relations between representatives of the lay public—that is, science writers for the newspapers and magazines—and physicians and research workers dealing at first hand with the cancer problem. The American Society took the lead in the formation of this central body as a part of the general educational program now being conducted throughout the country by its women's field army

"Most of the members of the council are geographically situated so that conference either in person or by telephone can be had with a minimum of delay or waste of energy or expense. This is an essential element in the potential value of the council. Those who will apply to it for advice or information will seldom be in a position where they can afford to wait for the ordinary slower methods of correspondence"

PHYSICIANS' LUNCHEON CLUB

A group of physicians have organized the Physicians' Luncheon Club. The object of the organization is to entertain at luncheon every Tuesday those physicians who are foreign to New York City for the purpose of making their stay in New York City more hospitable, to introduce them to such physicians who are present at luncheons, to introduce the members to these foreign physicians and to assist these foreign physicians in securing such instruction, attendance at clinics, hospitals, etc as they may desire, to give short informal talks on medicosocial subjects from an international

view point. These talks would deal with medicosocial progress as achieved by every country, and would be given by foreign physicians and by physicians resident of New York representing the different ethnical groups. Members shall consist of such ethical physicians, surgeons, and specialists who manifest their desire to join.

The hour of the luncheon is 1 P.M., the address, 135 E 55 St. Physicians wishing to attend or desiring any information may address the Physicians' Luncheon Club 135 E 55 St or may telephone Wicke-sham 2-7900

tests alone, none showed any positive readings on x-ray of the long bones and none showed any apparent physical stigmata. Six mothers were multiparae, two had received previous treatment but all had received treatment during the period of gestation, one at the first month, two at the second, one at the third and two at the fourth month.

In one case of this series the mother gave birth to two syphilitic children in succession, even after adequate treatment.

The first impression seems rather discouraging, but on second thought, it must be taken into consideration that these children presented only positive blood Wassermann tests without stigmata or positive x-ray findings, that they represent only about ten per cent of the number who were adequately treated antipartum. Besides the morphology and strains of the *Treponema pallida* are not one and the same in afflicted individuals.

Of the 1077 pregnancies that were inadequately treated before term, 253 resulted in miscarriages and 382 resulted in viable births negative at the time for congenital syphilis, but what the future holds for these latter children remains to be seen. Many of the mothers who received no treatment previously or during gestation, may give birth to a viable child, clinically free from the manifestations of syphilis. The probabilities are all in their favor of presenting some degree of stigmata later on, whether it be at the secondary dentition, puberty or early adolescence.

Review the number of cases in your experience that may be traced as evidences of congenital syphilis when the Wassermann may be negative or where the parents may be dead, but yet the unmistakable signs of a certain underlying deceptive factor being present, which possibly may be the solution of the problem

Let us consider the following as suggestive possibilities adenitis, scrotal tongue, Raynaud's disease, paroxysmal hemoglobinuria, undescended testicles, deafness, dwarfism, gigantism, rickets, hypothyroidism osteoperiostitis, dystrophies of the cranial bones, acromeglia, hyperostoses (frontal, occipital, and parietal) micro- and macrocephalism, facial

asymmetry, club-foot, hydroarthroses,
and osteoarthritis

The other 442 pregnancies represented children who were diagnosed as congenital syphilitics, having a positive Wassermann or presenting some congenital

TABLE I

					C Viable births positive for congenital syphilis	193	43 6%

any further manipulation, the wounds were closed. I fully expected a fatal outcome.

The next day the patient was still comatose. Lumbar puncture yielded uniformly bloody fluid under a pressure of 160 mm. Twenty-four hours later she appeared brighter, began to take nourishment and at that afternoon recognized visitors and began to speak. She improved steadily. By the end of two weeks she was out of bed and on July 7, five weeks after the operation she was discharged symptom free and with no abnormal neurological signs.

on July 12, 1935 complaining of violent headache.

For many years there was an intermittent purulent discharge from the right ear which was accompanied by gradual impairment in hearing. On several occasions she was treated for a "weak stomach" but otherwise she felt well and worked hard.

One week before admission she was awakened by a bursting sensation on the right side of the head. The headache was very severe and she vomited several times. The next day the headache subsided. For

Fig 1 A-P and P-A view showing dilatation and displacement of left lateral ventricle to the left. Pineal shadow and third ventricle also displaced to left. No air entered the right ventricle.

It is now sixteen months since she left the hospital and during this interval she has performed the household duties as usual, she has remained symptom free and repeated "check-ups" fail to show any abnormal findings.

Comment In retrospect I believe that this patient had an intraventricular hemorrhage sufficiently encapsulated to prevent any blood gravitating to the lumbar space. In all likelihood this collection of blood was close to the midline. In favor of this central location is the type of headache, the stiffness of the neck, and the absence of the lateralizing signs.

The prompt improvement following the evacuation of blood mixed with ventricular fluid can hardly be a coincident when we consider the precarious state of the patient just preceding operative intervention.

CASE 2 A J, a fifty-seven year old domestic was admitted to Mt. Sinai Hospital

several days she felt dizzy and was unsteady on her legs. On the morning of admission she was again seized with a violent spell of headache, and felt so dizzy she had to remain in bed. She was brought to the hospital for observation.

Except for the tendency of turning the head to the right and slight horizontal nystagmus to the right there were no abnormal neurological findings. Temperature was 99.8, pulse was seventy-eight, blood pressure was systolic 145—diastolic 100. Urine showed a faint trace of albumin and an occasional leukocyte. WBC numbered 12,000 with seventy per cent neutrophils and twenty-six per cent lymphocytes. Blood Wassermann was negative.

The headaches continued undiminished in severity and were relieved for only brief intervals by various sedatives. Four days after admission she suddenly developed a left hemiplegia, the neck became stiff, speech was thick, sensorium somewhat clouded,

CEREBRAL APOPLEXY

Two Recoveries Following Surgical Intervention

ABRAHAM KAPLAN, M D, *New York City*

From the Neurosurgical and Neurological Services of Mt Sinai Hospital

It has come within the experience of many physicians to see patients with no history or findings suggestive of hypertension, lues or renal disease, suddenly seized with a so-called "stroke." Some of these patients have survived such an episode and lived a good many years greatly handicapped by a residual paralysis with or without aphasic symptoms, others have failed to compensate for the initial vascular insult and have succumbed.

In the main the feeling has been that if the intracerebral hemorrhage is small the patient will most likely survive, if large there is nothing much that can be done about it. Surgical intervention in these patients has rarely been considered.

I wish to present two patients who came to operation because they were suspected of having some lesion other than an intracerebral vascular accident. Both were in a moribund state at the time of operation.

CASE 1 A. F. a sixty year old housewife was admitted to Mt. Sinai Hospital on May 28, 1935 in a stuporous condition.

Except for intermittent headaches for many years and some diminution in hearing for about five years there was nothing of any significance in the past history.

She was in fairly good health until eight days before entry when she was suddenly seized with a spell of frontal headache and began to vomit. In spite of this distress she continued to work about the house and on the following morning she felt as well as usual.

She was symptom free during the next week, but at 8 A.M. on the morning of admission she was again seized with headache which seemed to encircle the head from the bridge of the nose around to the occiput. This was accompanied by extreme nausea but there was no vomiting. Late that afternoon she could not be aroused. There followed periods of stupor and alertness, and during the lucid intervals she complained of pain in the back of the neck and of seeing double. Speech became very thick

and unintelligible. That evening she became irrational and violent and was brought to the hospital.

When the patient was first seen she was extremely restless and fought off any attempts at examination. Speech was incoherent. After a while she became drowsy. The lips were dry and cyanotic, no abnormal findings were detected in the heart or lungs, temperature was 101.6, pulse 120, blood pressure systolic 140—diastolic 80. Rhythmic twitchings of the toes and fingers were very noticeable. The neck was stiff and Kernig sign was present on both sides. Only a limited view of the fundi was possible because of bilateral cataracts. The disk margins were slightly indistinct. Both corneas were equally sensitive. Ocular movements were satisfactory in all directions. The patient reacted equally on both sides to painful stimulation and there was no evident paresis. All deep reflexes were sluggish. Babinski sign was doubtful on both sides.

Laboratory data The urine showed a faint trace of albumin. The blood Wassermann was negative. Blood sugar 170 mg per cent. Urea nitrogen ten. The spinal fluid was under pressure of 230 mm water, it was crystal clear, and had forty cells per cmm, all lymphocytes. Pandy test was positive, and only a trace of sugar was present.

The patient remained in a somewhat stuporous state and two days later one of the daughters offered additional information that on the day before admission the patient's head struck against a shelf.

Though the possibility of a subdural hematoma was remote, a bilateral trephine was performed as a last resort particularly because of the deepening coma. This was performed on June 1, over both postparietal regions. The exposed dura appeared normal in color and under moderate tension. The dura was opened on both sides but there was no evidence of any subdural hematoma. A ventricle needle was then inserted through the right hemisphere and at a depth of five cm, about fifteen c.c of dark blood mixed with ventricular fluid escaped. Feeling that little could be accomplished by

ized necrotic vessel wall containing recent thrombi. No tumor cells were seen anywhere in the large number of serial sections which were made.

Postoperative course The evening following the operation the patient was not as deeply comatose. The pupils were equal, she yawned a good deal and was able to swallow.

July 21 The patient appeared brighter, recognized friends and spoke a few words.

July 22 The left facial weakness was less marked.

July 23 Patient appeared much brighter, there were slight movements in the left arm and left leg. Still incontinent. No Babinski sign.

July 26 Patient was very alert, responsive, and jovial. Movements of the left side of the body improved. Sensation to pin-prick was surprisingly good on the left side as compared with the right.

August 1 Patient was allowed out of bed, mentally she was much clearer, and power on the left had improved.

August 2 She was no longer incontinent. Deep reflexes on the left were still depressed. No Babinski sign.

August 9 Astereognosis could not be demonstrated. Position and vibration sense were slightly impaired over the left hand.

August 11 Was able to take a few steps with practically no assistance.

August 1 Patient was allowed out of bed.

August 18 To gross tests a left homonymous hemianopsia was demonstrated.

August 21 Patient discharged. Very slight residual paresis was present. Blood pressure 112 systolic, seventy-five diastolic.

Since her discharge, 14 months ago, she has steadily improved. The paresis has completely disappeared. She is able to do light housekeeping, can take long walks and is not handicapped mentally. The only residual disability is a remaining left homonymous hemianopsia. (Fig 2)

Comment There can be little doubt that this patient had an intracerebral hemorrhage in the posterior part of the right internal capsule, which in its wake destroyed the greater part of the optic radiation from the right occipital lobe. Here again the clear spinal fluid as well as the clear fluid from the left ventricle is evidence that the hemorrhage was encapsulated. It is of interest also to note that intracerebral hemorrhage will produce ventricular displacement not unlike that of a cerebral neoplasm or abscess.

Discussion

Almost thirty years ago Spiller¹ pointed out that the duration of life may be many

hours after the onset of cerebral apoplexy. Instantaneous death is rare, even when the hemorrhage is very extensive or has broken into the ventricles.

In a recent study by Robinson² of encapsulated brain hemorrhages, he found that the survival interval in cases of intracerebral hemorrhages may vary from five hours to two months. The survival is shortest in patients having large hemorrhages extending into the pons or into the ventricles.

Recorded attempts at surgical treatment of an intracerebral hemorrhage are few indeed. In 1903 Cushing³ reported two cases of cerebral apoplexy who ultimately did not recover. However, he came to the conclusion that "the temporary amelioration of the severe symptoms is a sufficient justification for future attempts to afford surgical relief to certain carefully selected cases." Six years later Sargent and Russell⁴ contributed the report of a patient who had hypertension, a right hemiplegia, and was unconscious for ten days before operation. She slowly improved after the evacuation of the cerebral clot and nine months after the operation there was slight return of power, speech was limited to a few words, although she could satisfactorily understand printed words. Kron and Mintz⁵ report the evacuation of an intracerebellar hemorrhage seventeen days after the onset of symptoms. The clot was about the size of a bird's egg and was located 6.75 cm beneath the surface of the right cerebellum.

Peuch, Rappaport, and Brun⁶ report two recoveries following the removal of an intraventricular hemorrhage.

Bagley⁷ in a discussion of surgical considerations of cerebral hemorrhage reports three recoveries following intervention for nontraumatic intracerebral bleeding.

More recently Penfield⁸ reported in detail two similar recoveries after the evacuation of an intracerebral hemorrhage. In one patient the spinal fluid was diffusely blood tinged. Blood pressure was systolic 128, diastolic fifty-six. The second patient was known to have had hypertension for four years. The spinal fluid had a deep yellow tint and was under a water pressure of 290 mm. In the second patient ventriculograms

and sensation to pin-prick was diminished on the left side. The patient became drowsy. The spinal fluid was under normal pressure, clear, and colorless, and had only two leukocytes per cu mm. Wassermann and colloidal gold was negative. Total protein was seventy-seven mg per cent.

Steadily she became more drowsy and soon she could hardly be aroused. The head was turned to the right, neck was stiff but there was no Kernig. The right pupil was larger than the left, both however responded to light. The fundi showed some sclerosis of the retinal vessels but otherwise were normal. There was a slight left facial weakness. Accompanying the left hemiplegia was a slight left hemihypesthesia. The deep reflexes were more active on the left. Abdominal reflexes on the left could not be elicited. There was no Babinski sign.

The sudden onset of the left hemiplegia associated with coma in the presence of an old chronic ear on the right made the consideration of a cerebral abscess very formidable. However, a cerebral neoplasm or thrombosis was also seriously considered. For accurate localization, ventriculograms seemed advisable.

Operation (July 19) A trephine was made over the left postparietal region, the

exposed dura appeared normal and pulsated freely. Only twenty c.c. of clear fluid was obtained from the body of the left ventricle and fifteen c.c. of air was replaced. X-ray film (Fig 1) taken shortly after showed no air in the right ventricle, but the left ventricle was well-outlined, moderately dilated, and displaced to the left. The pineal shadow was also displaced to the left. The patient was returned from the X-ray department to the operating room and under local novocain anesthesia a trephine was made over the posterior portion of the right temporal lobe. A needle inserted towards the temporal lobe yielded clear ventricular fluid, indicating that the lesion was elsewhere. The needle was then directed toward the posterior portion of the internal capsule and a little old dark blood appeared at the orifice of the needle. Aspiration yielded fifty to sixty c.c. of old dark blood mixed with degenerated brain tissue.

Pathological report (Dr J. Globus) Microscopic studies of the material removed showed small islands of brain tissue irregularly distributed in large masses of what appeared to be recently extravasated blood. These islands showed normal structure in some parts and marked disorganization in other parts. In addition to numerous collections of pigment there were also circular areas of hyalinization resembling disorgan-

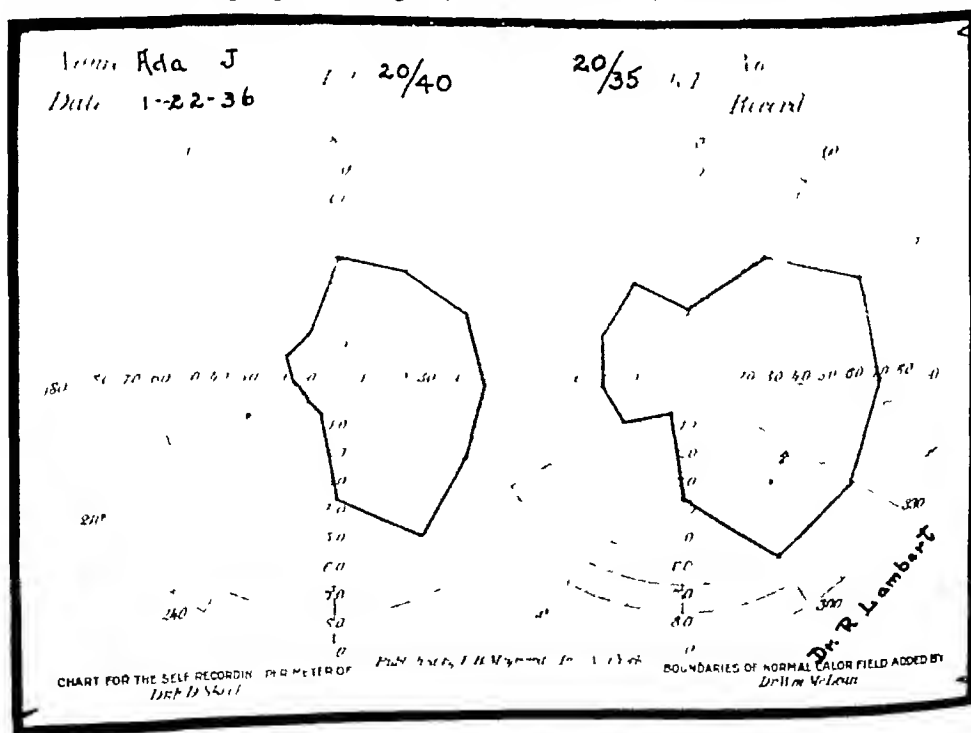

Fig 2 Residual left homonymous hemianopsia

GANGRENOUS CYSTITIS

TERRY M. TOWNSEND, M.D., F.A.C.S., *New York City*, and JACOB FRUMKIN, A.B., M.D., *Schenectady*

From the Department of Urology, Morrisania City Hospital, New York City

Gangrenous cystitis is an entity that must be considered by both the specialist and the general practitioner in every case of severe urosepsis. With a mortality rate of sixty per cent, the obstetrician with complications of labor, the neurologist with central nervous disease lesions, the internist with general infections, the radiologist with x-ray and radium treatment, the surgeon, the gynecologist, and urologist with surgical procedures and traumatism—all have to face its protean etiology.

Stirling and Hopkins¹ in their comprehensive report of 207 cases, roughly divide the etiological factors into five groups, according to the frequency

1 Traumatic

- (a) Pressure on bladder from without as malposition of pregnant uterus, tumors of the uterus, tumors of the ovary, prolonged labor
- (b) Distension of the bladder, internal or external as stricture, prostatic hypertrophy, calculi
- (c) Circulatory obstruction, ligation of adjacent arteries, venous obstruction from pressure, emboli, thrombosis, carcinoma
- (d) Operative procedure on the bladder, prostatic resection, incisional prostatectomy

2 Infections

Local, as chronic cystitis
General, as typhoid, diphtheria, measles, meningitis, puerperal fever

3 Nerve lesions of the cord.

4 Chemical, Substances injected into the bladder to induce abortion

5 Thermal, X-ray and radium treatments

Retention of urine and presence of infection are the most frequent predisposing causes, retention occurred in more than one-half of the cases. In an early report by Carson,² seventy-six cases out of 167 had retention. The complications of labor played the important etiological role in earlier reports, but recently the occurrence of the condition has been pre-

dominantly in the male. The improvement of the management of labor and aseptic technique has prevented this complication. Duchanoff³ reports cases of attempted abortion by injecting caustic solution into the bladder, resulting in gangrene.

Pathology

The pathology varies according to the extent, severity, and duration of the involvement. There may be isolated black areas or the entire bladder may resemble the surface of a blackberry, with marked congestion of the trigone. In other cases, all that can be seen is a generalized, grayish, mucoid, shaggy slough, with or without the appearance of new and old blood clots. The bladder wall may be markedly thickened with infiltration of red and white cells, the red cells predominating in hemorrhagic form. There is edema of the muscle fibers and thrombosis of the blood vessels. On the other hand, the musculature may be thin and stretched out. The serosa often presents dilated vessels and hemorrhages. The mucous membrane may be replaced by the dim shadow of its cells, fibrin, old and new red cells, polymorphonuclear, and lymphocytes.

Later the membrane loses its histological structure and may slough away in pieces or form an entire cast of the bladder. It is a dirty, gray or grayish-green, foul-smelling, shaggy membrane, often gritty, due to the deposits of urinary salts. After separation of the slough, the bladder presents its inflamed musculature if the involvement were deep. This transmits a grating sensation as the cystoscope is moved. Regeneration and fibrosis takes place later with contracture and reduction of capacity, usually followed by regurgitation and pyelonephritis. In most instances, the ureteral orifices are patent. At times, with a less extensive process, the bladder wall is pale

were performed which clearly localized the lesion to the left occipital region

Of course one must first make every attempt to establish the diagnosis of an intracerebral hemorrhage. The differential diagnosis between cerebral hemorrhage and cerebral thrombosis is not always easy. Aring and Merritt⁹ analyzed 245 cases of cerebrovascular lesions proved at autopsy from the records of Boston City Hospital. Of these 116 died because of cerebral hemorrhage, 106 died of cerebral thrombosis, and only twenty-three of cerebral embolism. They emphasize the following differential points:

1 Cerebral hemorrhage occurs more frequently in the decade from forty to fifty.

2 Sudden severe headache or vomiting at the onset is strongly in favor of a diagnosis of cerebral hemorrhage.

3 Convulsions were twice as frequent in cerebral hemorrhage as compared with cerebral thrombosis.

4 Coma at the time of admission to the hospital is about twice as common in patients with cerebral hemorrhage.

5 The progression of signs after the onset was more frequent in cases of cerebral hemorrhage.

6 Evidence of peripheral and retinal arteriosclerosis was frequently farther advanced in cases of cerebral thrombosis.

7 Stiffness of the neck was found in fifty-five per cent of cases in cerebral hemorrhage and only in seven per cent of the cases of cerebral thrombosis.

8 In thirty-eight per cent of cases of

cerebral hemorrhage the cerebrospinal fluid pressure was greater than 300 mm. In cases of cerebral thrombosis a pressure greater than 300 mm was rare.

In cases of doubt, therefore, where intervention is being seriously considered a preliminary ventriculogram for precise localization of the lesion is most advisable. Although the criteria for surgical intervention in patients with intracerebral hemorrhage cannot as yet be stated too definitely, nevertheless, from the reports already mentioned it would seem that operation is justifiable in young or middle aged individuals who manage to survive twenty-four or forty-eight hours after the initial vascular accident and whose symptoms are progressing. Those who are afflicted with advanced hypertension or renal disease or who show massive hemorrhage as revealed in the spinal fluid are best cared for medically.

73 E. 90 St

MEDICAL RADIO BROADCASTS

The following broadcasts have been scheduled by the New York Tuberculosis and Health Association under the auspices of the Medical Information Bureau of the New York Academy of Medicine, through Station WOR and network of Mutual Broadcasting system, and Station WNYC.

Tuesday, May 18, 1 00 P.M. Station WOR
—*Speaker* Dr. Katherine F. Dodge, Assistant Visiting Physician, Children's Medical Service, Bellevue Hospital. *Subject* "Rheumatism as a Cause of Heart Disease"

Tuesday, May 18, 4 00 P.M. Station WNYC
—*Speaker* Dr. William Bayard Long, Chairman, Social Hygiene Committee, New York Tuberculosis and Health Association. *Subject* "Congenital Syphilis"

Friday, May 21, 11 00 A.M. Station WNYC
—*Speaker* Dr. Harry L. Goldwag, President of the State Board of Podiatry Examiners. *Subject* "Clothing the Child's Foot"

Tuesday, May 25, 1 00 P.M. Station WOR—*Speaker* Mrs. Nathan Straus, Vice President, New York Section, National Council of Jewish Women, also member of Board of Directors of the Women's City Club. *Subject* "Keeping the Alien in Health"

Tuesday, May 25, 4 00 P.M. Station WNYC
—*Speaker* Dr. Maurice A. Bigelow, Professor of Biology Teachers College, Columbia University. *Subject* "Adolescence."

Friday, May 28, 11 00 A.M. Station WNYC
—*Speaker* Miss Dorothea C. Arnold, Personal Information Secretary, New York Tuberculosis and Health Association. *Subject* "Calling Caledonia 5-2240"

May 15, 1937]

of necrotic tissue were passed. Catheters drained well and the urine cleared of its bloody content.

Repeated observations of the spinal fluid showed negative findings. Antimeningococcic serum was administered, also transfusions, clyses, and other supportive treatment. The spinal fluid count ranged between 180 and 300 cells, most of which were lymphocytes. Despite treatment, the patient grew steadily worse. The temperature and pulse mounted and six days after admission the patient died.

Autopsy revealed fractures of the skull in the right anterior and middle fossae, localized meningitis and gangrenous cystitis. The bladder wall was markedly thickened. The mucosa was black, granular, and necrotic. On microscopic examination, the mucosa was seen to be replaced by a dim shadow of mucous membrane, fibrin, old and new red blood cells, polymorphonuclear leukocytes, lymphocytes, and plasma cells. The muscle layer was very thin. The blood vessels of the serosa were dilated and hemorrhages were seen. The entire bladder wall was infiltrated with white and red blood cells. The kidneys and ureters appeared normal.

Discussion. The above case emphasizes the fulminating progression of gangrenous cystitis. The patient was severely toxic and in two days without any prodromal signs or symptoms, developed the severe cystitis, involving an apparently normal urinary tract. The gangrenous membrane was seen before the sloughing occurred. The diagnosis was made upon the basis of a severe toxemia, central nervous system disease, retention, and hematuria. It is interesting to note that the trigone and ureteral orifices were not involved and the kidneys were free of pathology due to the patient's early exitus. Drainage of the bladder improved the condition and the hematuria decreased. Marion, commenting upon a case report of Levy-Dreyfuss in the *Journal of Urology*, emphasizes that in females the bladder can be curetted through the urethra, a point not mentioned in American literature.

CASE 2 M. D., male, white, fifty-one years of age, entered the hospital with a Pott's fracture. The patient gave a history of having suffered with cardiac symptoms for five years, and urologic symptoms of frequency, nocturia, and some difficulty starting the stream for the past year.

Physical examination revealed a patient who appeared older than his age, head and neck negative, the heart enlarged, the aortic second sound accentuated, a soft systolic murmur at the apex, rales at the

base of the right lung, a distended bladder. No other masses palpated. The sphincteric tone was good. The prostate gland was moderately enlarged, globular, and somewhat firm. The systolic blood pressure was 154, the diastolic ninety.

Urimalysis. The specific gravity was 1.018, the reaction alkaline, there was a trace of albumin and an occasional white blood cell.

The fracture was reduced without anesthesia and during the next few days his temperature ranged between 98.6 and 101° F. An electrocardiogram confirmed the diagnosis of arteriosclerotic heart disease with auricular fibrillation, for which he received treatment. He was voiding frequently but nevertheless the bladder was distended. Catheterization on one occasion yielded twenty-eight ounces of clear urine.

Six days after admission the patient became stuporous and cyanotic, the pulse became weak, irregular, and rapid, and the temperature rose to 104° F. The lungs were clear and resonant and there were no costovertebral signs. He was transferred to the Urologic Service, where the bladder was decompressed and treatment for uremia and the failing heart instituted. The erythrocyte count was 3,340,000, hemoglobin was sixty per cent, leukocyte count was 27,300, of which ninety-four per cent were polymorphonuclear cells. Vasectomy was not done, because of the critical condition of the patient. The urine revealed a specific gravity of 1.025, alkaline reaction, a heavy trace of albumin, forty-five to fifty white blood cells per field, in clumps, and fifteen to twenty red blood cells. The blood urea was fifty-two mg and creatinin 12 mg. The blood pressure dropped to eighty systolic and fifty diastolic.

The patient progressively grew worse in spite of supportive and stimulant treatment. The gross urine was blood-tinged, with numerous bits of grayish exudate. Three days later he died.

Autopsy. This revealed a typical gangrenous cystitis with necrotic, dirty grayish exudate, pyelonephritis with bilateral hydronephrosis, parenchymatous degeneration of the liver, acute splenitis, coronary sclerosis, and terminal congestion of the lungs.

Discussion. Gangrenous cystitis was not suspected in this case. The patient suffered from an obstructing prostate and paradoxical incontinence and consequent blood retention of the urea. The failing heart added to the burden of the kidneys. The hydronephrosis were evident proof of long-standing retention and not secondary to the gangrenous cystitis, since this condition

after exfoliation and the proliferation of tissue cannot be distinguished from normal mucosa

The offending organism is usually the colon bacillus, although streptococcus pyogenes, viridans, staphylococcus pyogenes, bacillus, typhosus, and Proteus may be present

Symptomatology

The patient appears very ill, pain varies in accordance to the extent and severity of the lesion. There is paradoxical retention and incontinence, and at times difficulty in starting urination. The urine is foul, ammoniacal, and contains pus and debris of bladder mucosa. Hematuria may or may not be present, but when present frequently is severe. When introduced, the catheter may plug with blood or debris, and for their dislodgment it may be necessary to distend the bladder first. There is usually a low grade temperature. Extension to the kidney produces a general constitutional reaction. If the peritoneum is involved, the usual signs of peritonitis are present.

In diagnosis, carcinoma and pseudomembranous cystitis should be ruled out. In pseudomembranous cystitis, the membrane is superficial, thin, frees easily from the mucous membrane and is exudative. The patient presents only symptoms of a cystitis.

Treatment

Early and adequate drainage is imperative. In males, a suprapubic cystostomy should be performed with removal of the necrotic tissue.

In females, the slough may be passed through the short caliber distensible urethra, or the bladder may be curetted through the urethra as advised by Marion. Adequate supportive measures should be instituted as transfusions, infusions, clysis, and urinary antiseptics. Frequent bladder lavages with Dakin's solution is an important postoperative measure. In border-line cases, an indwelling catheter, with bladder lavages of Dakin's or phosphoric acid, 0.5 to one per cent is often efficient, but close attention must be given to plugging of the catheter. Prophylactic treatment depends upon avoidance of prolonged re-

tention and pressure against the bladder wall.

The following is a report of five cases of gangrenous cystitis: three discovered at autopsy, one diagnosed before death and confirmed by autopsy, and one diagnosed, operated, and confirmed by autopsy.

CASE 1 I S, female, white, twenty-five years of age, was admitted to the medical service complaining of vomiting, aches and pains in back, neck, and extremities which began eight days prior and grew progressively worse. Seven weeks previously she was in an automobile accident, in which she received a shaking-up, lacerations of skin, and subsequently suffered from severe headaches. Her past history and family history were negative. There was no history of urinary disturbance.

Physical examination on admission presented an acutely ill patient. Her temperature was 102° F, pulse 110, blood pressure 134/80. She was irrational, her neck was rigid, bilateral slight Kernig's sign, there was ophthalmoplegia and bilateral choked disks. The leukocyte count was 12,700, of which eighty-two per cent were polymorphonuclear and eighteen per cent lymphocytes. Lumbar puncture disclosed a pressure of the spinal fluid of fifty-two mm. The fluid was cloudy and contained 280 cells per cmm, of which ninety-five per cent were poly and five per cent lymphocytes, globulin was absent, there was a trace of sugar. The urine, obtained by catheterization, showed a faint trace of albumin and a few white blood cells.

X-ray examinations of the skull and sinuses disclosed no pathology. The Wassermann was negative.

The patient required catheterization the next day, at which time twenty-four ounces of dark, concentrated, alkaline urine was obtained which contained numerous red blood cells. Because of the hematuria, urologic consultation was requested and the patient was cystoscoped two days after admission. The bladder was black throughout, except for the trigone, which was comparatively free from involvement. The mucosa was covered by a membrane resembling the surface of a blackberry. The ureteral orifices were patent, reddened, normal in size and location. No 6 catheters passed easily to each renal pelvis, and cloudy urine dripped slowly. Catheters were left *in situ*, and hourly lavages instituted. Culture of the bladder urine showed *Bacillus coli*.

The bladder condition improved in the next few days. No membrane or pieces

headache of one week's duration. He had had arterial hypertension for three years. For nine months he had complained of spots before his eyes and blurring of vision. For some time he had suffered from nocturia and difficulty in starting urination. Physical examination revealed a fifty-two-year-old

Wassermann and Kahn tests were negative. Blood chemistry revealed urea seventeen mgs, sugar ninety mgs. Urinalysis color amber, specific gravity 1.018, no albumin present, no sugar, microscopically negative. Electrocardiogram showed a sinus tachycardia. A phlebotomy was performed.

Fig 1 Bladder opened. Above, Lining shows hemorrhagic, gangrenous cystitis. Below, Prostate (Case 4)

white male, plethoric and orthopneic. The head and neck were normal, chest was emphysematous with rales throughout. The heart was enlarged downward and to the left. The pulse rate was regular, the cardiac sounds were of poor quality, no murmurs were heard. The liver was palpated three finger-breadths below the costal margin. No ankle edema was present. Reflexes were active. Blood pressure, 200 systolic, 120 diastolic. The temperature was 99° F.

and 340 cc of blood withdrawn. The pressure at this time was 165 systolic, 115 diastolic. The patient improved for two days, then suddenly developed signs of congestive heart failure. His breath became uremic in odor and the next day he was comatose. His temperature ranged from 99 to 104° F. During this time catheterization was required. Urinalysis revealed reaction alkaline, specific gravity, 1.020, a few white blood cells and a few granular casts. The erythrocyte count was

arises only after exfoliation of the membrane and contracture of the bladder followed by regurgitation. The pyelonephritis was probably secondary to the catheterization of the bladder and was not secondary to the gangrenous cystitis which is the general rule. The resistance of the patient being at its lowest point, the predisposing factor to this bladder condition was the chronic obstruction at the base and neck of the bladder caused by the chronic retention of urine as Haultain believes. This was another fulminating type of case.

CASE 3 W. A., an obese colored male, sixty-four years of age, was admitted to the Urological Service complaining of frequency (diurnal 5 to 6 times, nocturnal 2 to 3 times) for the past two years. A week previously after a long automobile ride he was unable to urinate and had to be catheterized. Since then frequency and nocturia had increased. The past history was negative.

Physical examination revealed negative findings, except the heart, which was slightly enlarged, with a loud, blowing, systolic murmur heard at the apex. Prostatic palpation showed the gland to be normal in consistency and smooth, the left lateral lobe somewhat enlarged, and the right to be small. The sphincteric tone was normal. The specific gravity of the urine was 1.015, reaction alkaline, a faint trace of albumin, one to two red blood cells and an occasional white blood cell per field. Wassermann reaction was negative. Erythrocyte count was 4,300,000, leukocyte count 11,000, hemoglobin sixty per cent. The systolic blood pressure was 180, the diastolic ninety. Blood chemistry revealed urea twenty-three mgs., creatinine one mg., sugar ninety mg.

A week after admission, during which time he was vasectomized and decompressed, he developed a "picket fence" temperature of 105° and began to hiccough. Physical examination gave no signs of extending pathology and blood culture was negative. Blood chemistry was reported urea nineteen mg., creatinine one mg., carbon dioxide combining power, normal. Urinalysis was negative. The Widal and undulant fever tests were negative. Ten c.c. of a one per cent solution of mercurochrome was injected intravenously. Repeated blood culture revealed a positive *Bacillus coli* blood infection and he was immediately transfused. The intravenous mercurochrome was repeated. His temperature dropped and he improved promptly. Ten days later his urea was twenty and the phenolsulphonephthalein excretion was fifty-eight per cent, with general condition good. He was cysto-

scoped and the following findings noted: marked commissural hypertrophy with some lateral lobe intrusion, immediately within and inferior to the right margin of the sphincter there presented a papillomatous growth about the size of a marble. Two days later, following another transfusion, a one-stage prostatectomy was performed. The "papillomatous" growth proved to be a protrusion of prostatic tissue, due to traumatism in passing the cystoscope. The patient progressed satisfactorily except for hiccoughs. On the fifth day his temperature rose to 105°. Since the catheter plugged, it was removed and he was put on suction. Intravenous mercurochrome was administered and his temperature dropped to normal the next day. Blood urea was 29 mg., creatinine 11 mg.

Three days afterward, the patient was taken off suction and an indwelling catheter anchored. His condition improved, the bladder drainage was clear for the next six days. The following two weeks the patient became gradually weaker. The temperature ranged between 101° and 104° F., he had numerous chills, at times he was disoriented and stuporous. The blood urea increased to fifty-nine mg., the creatinine to 18 mg. Another blood transfusion and two more intravenous injections of mercurochrome were given. Medical examination revealed nothing. The blood culture was again positive. The urine contained ten to fifteen white blood cells and bits of necrotic tissue. The patient died in a coma.

Autopsy Localized pelvic abscess along bladder sinus tract, gangrenous cystitis with bilateral pyelonephritis, mercuric ulcers of the cecum and rectum, infarcts of the spleen and fibrous pleurisy on right side, acute splenitis, parenchymatous degeneration of the liver and heart, passive congestion of the lungs, thrombosis of left hypergastric vein.

Discussion The etiological factors in the above case were the septicemia and the thrombosis of the left hypogastric vein. There were relatively few pus cells in the urine sediment, whereas the usual case presents a large number, together with debris of the gangrenous bladder, which is diagnostic. As in the other two cases, the urine was alkaline but was not grossly hematuric. It is interesting to note that the pathologist reported mercuric ulcers of the cecum and rectum (although the patient had received only five intravenous injections of ten c.c. each of one per cent mercurochrome) and there were no other signs or symptoms of heavy metal poisoning.

CASE 4 A. S., was admitted to the medical service complaining of dyspnea and

copically, loaded with red blood cells Wassermann and Kahn tests were four-plus Blood urea was twenty-five mgs, creatinin, one mg Culture of the urine was positive for *Bacillus coli*

He was transferred to the Urologic service and the bladder gradually decompressed His temperature ranged from 100 to 101° F He improved under the treatment and the lungs cleared up After a few days the catheter began to plug and the patient

gritty, membrane which was removed en masse (Fig 4) The bladder was red with areas of gray slough His general condition was so poor that further toilet was abandoned and a tube and drains placed

After a transfusion of 500 c.c and supportive treatment, he improved and in three weeks was ambulant in the ward

The pathologist reported that the removed cast consisted of degenerative amorphous

Fig 4 Gangrenous membrane Entire cast of bladder removed at operation. (Case 5)

was cystoscoped. The bladder was emptied with a McCarthy evacuator and a large number of old and new clots were removed, together with pieces of tissue. A generalized grayish, shaggy membrane was seen with a few small areas of reddened tissue, from which specimens for biopsy were taken. No landmarks could be discerned. The bladder neck and the posterior urethra, except for hyperemia, were normal. As the cystoscope was moved, a grating sensation was obtained. Biopsy of these tissue shreds revealed inflammatory and degenerated amorphous material without evidence of malignancy

After transfusion of 500 c.c. of whole blood, suprapubic cystotomy was performed under infiltration anesthesia, eighteen days after admission. The bladder was unusually thin and lined with a greenish-gray, necrotic,

tissue in which no histological structures could be made out. Diagnosis: Necrosis of bladder wall.

Eight weeks later he developed a palpable mass in the right costorenal angle, with crepitation. Cystoscopy was refused, but after intravenous urography, flat x-ray plate showed a large dense mass on the right side of the abdomen. No evidence of any opaque material in the right kidney was found.

Right nephrectomy was performed and immediately beneath the thin muscles and skin, a large pyonephrotic kidney was encountered. During its removal, it ruptured and copious greenish-yellow pus escaped into the wound.

Microscopic examination showed this pus to contain *Staphylococcus albus* and an unidentifiable gram negative bacillus. Cul-

Fig 2. Free margin *above* showing gangrenous exudate, *Below* Edematous muscle fibers (Case 4)

4,900,000, the hemoglobin ninety per cent, the white blood count 8,300

The patient died and an autopsy revealed nephrosclerosis, infarcts of lung, spleen and heart, gangrenous cystitis, general arteriosclerosis, cardiac hypertrophy with coronary sclerosis, and passive congestion of the liver, lungs, and spleen

The vessels of the bladder wall showed endarteritis and thrombosis. The pathologic diagnosis was gangrenous cystitis. The passive congestion may have added to the burden (Fig 1-3)

CASE 5 G Z, a forty-year-old white, emaciated and dehydrated male, appeared acutely ill. The patient signed out of hospital the previous morning, with a diagnosis of right lower lobe pneumonia. He grew worse and returned to the hospital. The only history obtainable was that he had been catheterized by his wife because

of retention. Incidentally, on the same day of admission the wife was committed to the psychopathic ward.

Physical examination presented a moribund individual. His pupils were unequal and reacted sluggishly, teeth were poor, gums, tongue, and throat coated and dry, the heart presented no pathology. In the lower lobe of the right lung there were numerous crepitant rales and diminished breathings. Except for the distended bladder and bilateral costovertebral tenderness, the abdomen was negative. Ankle pitting easily on pressure. The reflexes were diminished. Rectal examination revealed good sphincteric tone. The lateral lobes of the prostate were somewhat enlarged, irregular in shape, soft, the median sulcus shallow.

Blood examination hemoglobin sixty per cent, erythrocyte count 3,700,000, leukocyte count 18,400, with eighty-nine per cent polymorphonuclear cells and eleven per cent lymphocytes.

Urinalysis. The urine was dark brown in color, specific gravity was 1.020, reaction alkaline, albumin four-plus, micro-

Fig 3 High power Thrombosis of vessels surrounded by polynuclear, hemorrhagic exudate. (Case 4)

PREMATURITY AS A PUBLIC HEALTH PROBLEM

MORRIS GLEICH, M D, *Bronx*

A five year study was made of the premature infant situation in three city hospitals. There was also included, a general health survey of the East and Central Harlem Health Districts*. It soon became apparent from this study, that the morbidity and mortality of these premature infants ran hand-in-hand with the general health status of the community. We were impressed by the fact that a public health consciousness must be evoked and broader measures instituted, to cope with this situation. No longer can we treat premature infants as single entities. We must attack the entire premature infant problem enmasse.

990 premature infants were born in three municipal hospitals (Table I) in five years, an incidence of 4.5 per cent. Over this five year period, the incidence for prematurity at Harlem Hospital was 8.24 per cent, Fordham 3.24 per cent, Greenpoint 2.54 per cent. In the last two years the incidence for prematurity at Harlem Hospital has been ten per cent.

The high incidence of prematurity at Harlem Hospital is directly dependent

* These health districts are a few of a number being established in New York City. I am indebted to Dr. C. Martin, Records Division, Dept. of Hospitals and Mrs. E. Fagin, Records Dept., Harlem Hospital.

upon the high adult morbidity and mortality (Table III). The thirteen per cent incidence for leucic pregnant women bears this out.

Of the 990 premature infants born in these three city hospitals in five years, 179 died after having lived forty-eight hours, a mortality of eighteen per cent (Table II). Of these 179 infants, sixty-eight per cent died at Harlem Hospital, ten per cent died at Fordham, and twenty per cent at Greenpoint Hospital.

Premature infants which have lived forty-eight hours can, in the majority of instances, be saved. To do this will require team work on the part of the hospital and Board of Health.

Table III gives one a splendid idea of the difference in adult morbidity and mortality in various health districts.

The morbidity and mortality of adults, in any community determines the health of its children. With a general mortality rate of 20.65 and 14.12 for the Central and East Harlem Districts, respectively (New York City average 10.23), with the tuberculosis mortality rate per 1,000 population 458 and 301 respectively for these same districts, (New York City average 136) with the maternal mortality rate per 1,000 live births 10.9 and 8.4 respectively for these districts, (New

tures and animal inoculations of this pus were inconclusive. Section of the removed kidney showed diffuse suppuration involving the entire kidney, with no areas of normal tissue.

The patient died twenty-six days later. On autopsy, vast pathology was found, summarized as postoperative suprapubic cystotomy and right nephrectomy, bilateral apical tuberculosis and pleuritis, right bronchopneumonia and pleural effusion, luetic aortitis, moderate atherosclerosis, localized peritonitis with abscess formation, cholecystitis and liver abscess, multiple abscesses and pyonephrosis, left, gangrenous cystitis, prostatic and perirectal abscess.

Discussion. The infection was introduced during the frequent catheterizations to relieve the retention caused by central syphilis. The toxemia of the pneumonia was sufficient to break down such resistance as he may have acquired in the first infection.

Conclusions

- 1 All departments of medicine and surgery must heed the etiologic factors of gangrenous cystitis.
- 2 Retained infected urine is the most prevalent cause of the disease.
- 3 Its early recognition and free bladder drainage affords the only hope of cure.
- 4 Recoveries from the disease are rare.
- 5 The five autopsies are in concord with the findings of other observers disclosing widely disseminated bodily sepsis.

A DANGEROUS WEED WE DON'T WANT

An upstate newspaper of wide influence, the *Troy Morning Record*, endorses Dr Terry M Townsend's able attack on compulsory health insurance, and remarks

The medical society could go farther and say that the citizenry of the country prefer their

doctors to be entirely free from the influences of bureaucrats and they, themselves, would like to be left alone and independent in solving their insurance problems. The paternalism of some of the European countries is a dangerous weed in the fertile field of our representative and independent government.

NUTRITIONAL REVIEWS II

Caloric Requirements

HERBERT POLLACK, M D and HENRY DOLGER, M D, *New York City*
From the Metabolic Clinic of Dr H Lande and the Medical Service of Dr G Baehr,
Mt Sinai Hospital

The first¹ paper of this series was devoted to the application of accurate experimental data to the problem of protein requirements. It is now necessary to consider the total caloric requirements in the light of similarly verified and investigated facts.

The popular misconception as to minimum protein requirements was shown to be based upon certain fallacious arguments. The average "standard" dietary requirement of 3000 or more calories per day can also be traced to inaccurate reasoning and the failure to apply fundamental physiological principles. It must be emphasized that the habitual voluntary consumption of food is unconsciously accepted as the food requirement. This has led to the practice of utilizing a statistical analysis of the eating habits of a class or group as a basis for their actual nutritional needs.

The title of E P Cathcart's paper,² "Some Difficulties in the Quantitative Assessment of Diets" indicates the gross inaccuracy of obtaining and applying data on food consumption. He points out many of the major errors involved in such a study, i.e., (1) overestimation of needs, (2) transfer of single individual estimates to a group, (3) inability to get accurate dietary histories and arriving at conclusions by assumption. He concluded that a more accurate estimate of actual food consumption could be made from a study of the waste rather than the marketing.

The best available data as to minimal caloric requirements for large groups is derived from the observations on the German people during the World War. Rubner³ observed that constant weight could be maintained when the individual consumed 1300 calories daily. Benedict, Miles, Roth, and Smith⁴ under the stimulus of the War made an intensive study of the actual caloric requirements of healthy men. These men before the experimental period were ingesting an

average of 3200 to 3600 calories a day. They were then given a diet of 1400 calories a day for a period of three weeks without changing their other living conditions. The average weight loss for all was twelve per cent below the original level. It was then found that these active athletic men could maintain this new weight on 1950 calories a day, or approximately one half of the amount they ingested ordinarily. Tests revealed that muscular efficiency was not impaired. They were able to perform set exercises with less expenditure of energy than at the beginning of the experiment. Lusk⁵ in reviewing these experiments, pointed out the fact that there is a biological adaptation to a lowered energy intake preventing the exhaustion of the body reserve. It can be demonstrated that caloric requirements may be calculated on a definite rational basis.

In times of economic stress the burden is to maintain a large population group in as adequate a state of nutrition as possible. It becomes necessary to know definitely what minimum standards can be accepted with safety. The development of accurate standards and technics for the measurement of the actual caloric expenditure has progressed rapidly. The present problem resolves itself into one of the clinical application of the data accumulated in the laboratories. The concept of a definite basal metabolism is universally accepted. To this basal figure, increments are added for activity, efficiency, specific dynamic action, environmental temperature changes, and state of nutrition. These must not be confused with the factors that control the basal caloric requirements, i.e. age, sex, weight, height, body temperature, occupation, race, and the previous diet.

An instance of the degree of one variability is the decreasing rate of metabolism from the age of sixteen to sixty, amounting to a total drop of over twenty-one per cent per square meter per hour.

TABLE III—COMPARATIVE RATES BETWEEN MORRISANIA HOSPITAL AND HARLEM HOSPITAL HEALTH CENTER DISTRICTS (1935)

Health center districts		Matern rate per 1,000 live births	Birth rate per 1,000 population	Infant mortal rate per 1,000 live births	T B Mort. rate per 100,000 popu- lation	Pul T B new cases rate per 100,000 population	Veneral dis. new cases—rate per 100,000 popul.	Other infect. dis- eases, rate per 100,000 popul.*	General mortal rate per 1,000 population

Harlem Hospital	Principally from Central Harlem East Harlem	10 9 8 4	16 22	91 85	249 139	458 301	3809 1477	1127 2127	20 65 14 12
N Y C Average		6 43	14	53	62	136	727	987	10 23

* Includes Typhoid, Scarlet Pertussis Diphth Influxa and Pneumonia

York City average 6.43), with the venereal diseases, new cases, per 100,000 population 3,809 and 1,477 respectively (New York City average 7.27), small wonder that the infant mortality rate per 1,000 live births is ninety-one and eighty-five respectively for Central and East Harlem Districts (New York City average 5.3), and the incidence for prematurity in the last two years ten per cent.

The Harlem Health Center Districts would be a suitable place to start and develop a premature infant station. If successful, such units could be established in other districts. This station should contain:

1 A premature infant ward, to hold about thirty children, suitably equipped, and modelled after the "Cradle" at Evanston, Ill.

2 A special corps of trained nurses

3 A group of trained nurses to visit the homes upon the discharge of the premature infant from the hospital

4 A follow-up clinic for the premature infant and its mother

5 A breast milk service, for the purchase and care of breast milk

6 A pediatrician assigned to the ward

7 An intern regularly assigned to this service

8 An ambulance, equipped with incubator, oxygen tank, etc. to bring to the hospital those premature infants whose parents cannot afford a private doctor. This will require immediate notification by physician or midwife.

9 There shall be instructions for doctors and nurses in the care of premature infants.

The question of the care of premature infants is only one of the many problems in the Central and East Harlem Districts. To deal with it successfully requires an attack on all fronts, by private and public health officials. A local hospital cannot reach all the sick in any community, especially the ambulant sick. With a reduction in the morbidity and mortality of adults will come a decrease in the diseases of childhood. What can be done in one district can be repeated in others.

sented in the tables are high if one considers this factor

It is evident that the general population is unnecessarily luxurious in its dietary habits. This self-indulgence is reflected in the mortality tables of life insurance companies. Only sixty per cent of stout people reach the age of sixty as compared to ninety per cent of thin ones. At age seventy the figures are thirty and fifty per cent respectively. The age of eighty is reached by only ten per cent of the obese as compared to thirty per cent of the thin, a ratio of 1 to 3. Perhaps that is what Shakespeare meant in "Henry VIII" when he wrote

"Leave gormandizing, know the grave doth gape
For thee thrice wider than for other men"

McCay and Krowel⁶ presented some extremely interesting data on the relationship of longevity of life to excessive feeding. At the end of thirty-seven months (equivalent to 10 years in humans) only one out of thirty-six full fed rats survived, but twenty-one out of the seventy underfed rats were still living. They attributed this longevity solely to the slowness with which these animals reached maturity. Comparatively few patients seen by the physician are in a state of complete starvation. There is no question, however, that many of the acutely and chronically ill patients suffer from a more or less low grade state of

starvation. This has no reference to the so-called deficiency diseases which result from the lack of vitamins. These underweight patients are characterized by low basal metabolic rates. Thus decreased metabolic rate is an important diagnostic point in the quantitative estimation of clinical inanition.

Summary

The relationship of obesity to the degenerative diseases is all too obvious. The striking statement of Joslin's that eighty per cent of all diabetics are overweight, should initiate a more vigorous campaign to control the excessive caloric intake of the people. The old standards of the daily caloric requirement of the individual of 3000 to 5000 must be reduced in the interest of health, longevity, and economy. On the basis of the metabolic ideals, the new standard should be 1800 for women and 2200 for men. Adequate proteins, vitamins, and minerals can be incorporated in these new standard dietary requirements.

EUROPE'S STARVLINGS

Revelation that western Europe alone has thirty to forty million people living below a reasonable standard of nutrition presents an important health problem to the League of Nations. Efforts of the League to raise world standards of nutrition beyond the mere subsistence level were reported at the recent meeting of the American Dietetic Association. Dr. Mary Swartz Rose, of Teachers College, Columbia University, said that latest findings of the League's nutrition committee show that in no country of western Europe does the whole population come up to the desired standard.

In one boys' school near London the boys were considered to be well fed on an

institutional diet, said Doctor Rose. For four years, however, some of the boys were given supplementary food, with impressive results. The most striking improvement occurred in a group drinking a pint of milk a day. Boys six to ten years old drinking the milk gained on an average 698 pounds a year and grew 273 inches, whereas boys on the regular school diet gained 385 pounds and grew 185 inches.

The Milk in Schools Act, passed by the British Government in 1934, has followed from such demonstrations, and as a result Doctor Rose said, several million British school children buy milk daily at half the current price.

This is compensated for in part, in so far as the total caloric requirements go, by the increasing surface area with age. It should be borne in mind that the increasing surface area (gain in body weight) is in turn due to the maintenance of an isocaloric intake in the face of a gradually decreasing caloric requirement. The complexity of the interrelationship of these two factors alone illustrates the futility of generalization.

Since the concept of a definite basal metabolism is accepted, there is no reason to prevent the application of these principles to the estimation of the total caloric requirements of the individual. The actuarial statistics compiled by both the

Du Bois. The recently corrected values for calories per hour per square meter by Boothby can then be used for the age and sex factors. From this one derives the figure of 1675 calories. For light work an increment of thirty per cent is added, and the final figure of 2175 calories is obtained. This figure represents the average daily caloric requirement of that group of adults whose actual caloric requirements are greater than any other adult group.

On the same basis one can calculate the average caloric requirement of the general population from the height, weight, and age tables compiled by the Life Insurance Actuarial Societies. The

life insurance companies as well as by the United States Army Draft Board during the World War presents sufficient data as to the actual weight-height measurements for various age groups of both sexes. From the published figures on the actual caloric expenditure of the individuals that are at present in use for determining the basal metabolic standards, one can derive the total caloric expenditure of any particular group in terms of calories per body weight in the twenty-four hour period.

The mean height and weight of the adult American male was determined during the War from a study of the measurements of over a million men between the ages of twenty and thirty. The height was found to be 5 feet 7½ inches and the weight 141 lbs. If to these measurements one applies the standards in use for determining the basal metabolic rate, the actual caloric consumption can be approximated. Thus the surface area is determined by the nomograph of

accompanying table indicates the results. It is interesting to note how the various factors compensate to result in much the same values.

Actually these life insurance tables should be revised downward to the real, ideal weight. The life insurance standards were obtained by averaging the weights of large groups of individuals regardless of their apparent state of nutrition. When one calculates the tremendous preponderance of the obese in the general population as compared to the so-called underweight people, it is apparent that these figures are "weighted" by this ratio. An actual count of the individuals in a home relief station in New York City revealed a thirty-seven per cent obesity in this group who are living on very limited incomes. At another time a random count of three hundred individuals on a busy corner in the shopping district of New York City revealed a ratio of ten obese to one thin person. Of necessity then, the calculations pre-

machine built primarily for medical diathermy are unmanageable and cause many of the difficulties encountered in electrosurgical technic. I cannot emphasize too fully the importance of a properly constructed coagulation, desiccation, and fulguration circuit for attaining the perfection of end-results with a minimal of discomfort.

To recapitulate, pain is best avoided by careful retraction of the upper reflection of the capsule, the plica semilunaris, when coagulating the upper pole of the tonsil. It is of paramount importance to completely ablate all of the cryptal tissue in the superior fossa right down to membrana basalis. It is in this upper fossa that access to the retrotonsillar area is gained through the very thin capsular tissue separating the tonsil proper from the aponeurosis of the constrictor muscle. Usually the capsule is anomalous here, and a direct communication permits infection to pass without obstruction into the potential peritonsillar space. Should a history of quinsy or retrotonsillar abscess be elicited, it is then necessary to totally eradicate all infected tissue posterior to the tonsil, obtaining a smooth, glistening fossa formed by the aponeurosis of the constrictor muscle of the throat. In this respect I have often noted after the most painstaking and thorough surgical tonsillectomy, where a history of retrotonsillar abscess is present, that infection may remain latent for years. An acute exacerbation of a transient infection may reveal a pocket of pus deep to the aponeurosis of the constrictor muscle. Sometimes in the case of discrete tonsils buried deeply in the muscle, a fistulous tract may require ablation in order that total eradication of an overlooked focus may be accomplished. Electrosurgery is the method par excellence for correcting any of these puzzling abnormalities following the orthodox operation.

To obviate the occurrence of hemorrhage we must again pause to study the anatomy and the physiology of the tonsil from the electrosurgical point of view. The tonsil is highly vascular. It receives its blood supply from at least five distinct branches of the external carotid artery. It is this vascularity

which makes it necessary to follow my double-checking technic to control post-operative bleeding. The modified coagulation technic was first inaugurated to completely control bleeding. It was later that I clinically noted that patients complained less of the pain following coagulation, after the application of the monoterminal electrode both deeply and superficially.

Technic of Modified Coagulation

The patient having dissolved two butyn-amidopyrine lozenges on the tongue and being thoroughly swabbed with two per cent Pantocain solution is then ready for an electrosurgical treatment. Rarely will the pharyngeal reflex require further anesthetization. Depending upon the size of the tonsil, from five to six applications of the biterminal or double tipped electrode are made to cover the entire organ to the depth of one mm and spaced one mm apart. The tip of the electrode is always pointed towards the center and away from the plical folds. Coagulation should never approach the highly sensitive capsule and the reflected plical folds closer than is absolutely necessary. The application of the monoterminal electrode now follows in the modality called desiccation. The pointed, angulated needle is placed through the coagulum for the depth of at least one mm and never more than two mm. The current from the Oudin terminal is now employed to maximum heat tolerance. The patient decides just when the heat generated in the tissue is sufficient to thrombose those larger vessels which may have escaped plugging during the coagulation process. Four to six such applications usually suffice to completely control the primary and secondary bleeding. The same monoterminal needle electrode is now used for fulguration. Sparking is obtained by keeping the tip of the electrode at approximately one mm distance from the tonsil. The entire area of the tonsil is sprayed with this spark of one mm in length. The resultant coagulum becomes drier and much more friable and does not become a foul, sloughing mass. It now will separate out as a pulverized mass almost unnoticed while the patient

ELECTROSURGICAL TONSILLECTOMY

Control of Pain and Hemorrhage

LEWIS J GORMAN SILVERS, M D , *New York City*

Markedly conflicting opinions still exist in reference to the problem of pain and hemorrhage occurring in the routine diathermy extirpation of the tonsils. There are some who, in the throes of learning the complicated technic, prematurely condemn the method as inefficient and even more dangerous than the orthodox surgical tonsillectomy. They have apparently forgotten the time and effort spent in overcoming the hazards of the ordinary surgical tonsillectomy. There are others, however, more recently like Ground,¹ who have no compunctions in "introducing electrocoagulation as the method of choice for the sterilization and removal of tonsils in the adult."

To imply that complete and absolute control of pain and bleeding is possible in every case subjected to electrosurgical tonsillectomy would be either a question of good fortune on the part of the operator or an acknowledgment of ignorance of the anatomy and physiology of the tonsil and its adjacent structures. It is now possible, with a modification of the coagulation technic, which I introduced in 1930,² to so control pain and bleeding that its incidence may be considered entirely negligible. Experience with close to two thousand electrosurgical tonsillectomies covering a period of twelve years, and including a large group of physicians among whom were some nose and throat specialists makes me feel today more strongly than ever in favor of the modified tonsillar electrocoagulation as the method in the adult.

As explained in an analysis of one hundred routine cases,³ pain is a factor in the extirpation of the tonsil independent of the reaction that may occur following each treatment. The "immunity reaction" that ensues is apparently dependent upon the type and virulence of the organism infecting the tonsils treated. Pain on the other hand depends on the damage done to normal epithelialized structures. To avoid pain we must first re-evaluate the importance of the anatomical structures surrounding the

tonsil from the electrosurgical point of view. A scientific appraisal of the deleterious lymphatic structure which requires removal and of the innocuous epithelialized tissue to be avoided is essential to success in this field. The tonsil alone must be coagulated and the palatoglossus and palatopharyngeal muscles or pillars as well as the plica semilunaris above and the plica triangularis below should be sedulously avoided. This is made possible by the use of special pillar retractors and an improved set of biterminal and monoterminal active electrodes.

Examination of the throat of a prospective patient enables the experienced operator to determine at once if the case at hand is simple or difficult to execute. The size of the tonsil, redundancy of pillars, adherence of pharyngeal folds, and the depth of the faucial cavity may all be surmised at a glance. The large, infantile, highly lymphatic tonsil non adherent to surrounding structures is the simplest to remove. The small, deeply imbedded, fibrous tonsil adherent to its pharyngeal folds and bound down by repeated exudative inflammation requires considerable skill to avoid undue pain. Thorough topical anesthesia with two per cent Pantocain for a period of ten minutes is necessary to avoid the pain which accompanies the active biterminal electrode as it contacts the pharyngeal folds covering the deeply imbedded tonsil. To allay the pharyngeal reflex in the hypersensitive individual, I resort to a lozenge containing amidopyrine gr II and butyn gr ss prepared in a suitable pleasant tasting excipient. This troche is dissolved on the tongue just prior to the application of the local anesthetic and may be used at intervals following treatment to allay irritation in the extremely sensitive patient. The machine should be set to deliver a smooth, nonfluctuating current sufficient to produce even, snowy white, nonadherent coagulation. Only an apparatus of low voltage, though high frequency, can accomplish this desired result. The older types of high tension

PERFORATED DUODENAL ULCER COEXISTENT WITH ACUTE APPENDICITIS

WILLIAM C EMERSON, M D , *Rome*

Perforated duodenal ulcer and acute appendicitis occurring simultaneously is a very rare condition. This is attested by the fact that a careful survey of the literature has failed to show that a similar case has ever been reported. The nearest approach was that of André¹ who in 1911 reported the case of a woman presenting symptoms of acute appendicitis. She was operated upon and the appendix removed. During convalescence she developed a cough with purulent expectoration, culture of which showed streptococci, staphylococci, and Koch bacilli. The patient died and autopsy revealed a subdiaphragmatic abscess connected with a fistula to a perforated round ulcer of the pyloric portion of the duodenum. The perforation had occurred after the appendectomy

Case Report

My patient was a male, age thirty-five, painter by trade. He gave a history of having had stomach trouble for two years. There were remissions of this gastric distress, the remissions lasting several months. His appetite was good at all times. He had lost no weight. His father and mother had been subject to attacks of indigestion.

The present attack began with acute abdominal pain, the pain being very severe, cramp-like in character, and localized in the epigastrium. There was marked nausea but no vomiting. He remained in bed did not call a physician, with the belief that he could wear out the pain. Twenty-four hours after the attack the pain was so severe that a physician was called. The pain at this time was generalized over the entire abdomen.

Examination showed an acutely ill male with slightly sunken cheeks and marked pallor of the skin. Temperature was 101°F, pulse ninety, respirations twenty-eight. Pupils were equal, reacted to light

and to accommodation. Lungs were clear and the bases expanded equally. Heart was rapid but not enlarged. There were no murmurs. There was marked tenderness over the epigastrium and right lower quadrant with board-like rigidity over the entire abdomen more marked over the epigastrium and right lower quadrant. Reflexes were normal. Extremities were normal. On admission to hospital the blood count was red blood cells 5,200,000, white blood cells 14,200, polymuclear neutrophils eighty-three per cent and small lymphocytes seventeen per cent, hemoglobin ninety per cent. There was no stippling of the red blood cells thus ruling out lead poisoning. *Urine examination* Specific gravity 1.011, albumin and sugar negative, microscopic a few epithelial and red blood cells.

Immediate operation was performed. On opening the peritoneal cavity there was a large amount of seropurulent fluid. The peritoneum was red and injected. The appendix appeared larger than normal and slightly edematous. The appearance of the appendix indicated that there was not sufficient pathology present to warrant the extensive generalized peritonitis. The appendix was removed and the abdominal viscera examined. There was a large mass of omentum adherent to the pyloric portion of the duodenum. This adherent omentum was removed and directly beneath there was a small umbilicated area 1.5 cm in diameter in the center of which there was a depression two mm in diameter which was loosely covered with flakes of fibrin indicating a small perforation of about twenty-four hours duration. The perforation was repaired and the peritoneal cavity drained.

Pathological examination of the removed appendix revealed an acute appendicitis. The patient made an uneventful recovery and left the hospital three weeks after admission.

"In the health of the public lies the wealth of the nation"—Gladstone

gargles with a suitable astringent

Coagulation causes a complete destruction of cell walls and nuclei, the tissue becoming a homogeneous, hyalinized mass. Desiccation is confined more to the needle tip and shrivelling of cells and nuclei is evidenced. Fulguration completes the dehydrating process superficially and is most advantageous in sealing the smaller vessels and lymphatics, thus preventing metastasis and undue absorption of any of the toxic end-products of tissue combustion. Should one of the larger vessels remain patent during coagulation, it is the function of desiccation to thrombose this vessel at the margin of the coagulated area. It is important to restrict the heat generated in the tissue to a white, nonadherent coagulum. Cauterization or charring of tissue must be avoided.

As previously demonstrated⁴ the absorption of the end-products of electrocoagulation is provocative of the "immunity reaction" which ensues. This reaction continues after each treatment as long as infection exists in the tonsillar crypts and is independent of the amount of coagulation. The virulence of the invading organism determines the severity of the general response or autogenous vaccine reaction. When the infection is either attenuated or eliminated, as is usual after the fourth treatment to each tonsil, there is rarely a general or grippe-like reaction. Fulguration, although sealing the lymphatics and inhibiting the non-specific protein reaction, does not interfere with the absorption of the end-products of bacterial destruction. It is this absorption, of necessity, which accounts for the unabated vaccine-like reaction which affords the patient so much relief of both subjective and objective symptoms. I have often observed⁵ and already recorded the rapid disappearance of cervical lymph node enlargement, both in tuberculous and non-tuberculous infections, following the first few applications of surgical diathermy. Infection is attenuated or eradicated prior to the total extirpation of the tonsil.

To avoid inadvertent injury to adjacent structures, the electrodes have been insulated with hard rubber throughout the entire shank. The tip alone is left exposed. The angulation of both bi-

terminal and monoterminal electrodes is carefully insulated so that no damage is done to the posterior pillar when the needle is aimed at the anterior portion of the tonsil. The tips of the biterminal electrode are properly blunted to permit the operator to more accurately estimate the depth of coagulation. This is particularly of importance when the capsule is reached. Unless, as has been noted above, there is a history of peritonsillar infection, the capsule should be left *in situ*. The fibrous capsule then acts as a barrier to future invading organisms. The monoterminal electrode used in fulguration and desiccation employing the higher voltage Oudin current has been lengthened to thirteen cm. This permits the shank of the needle to insert into the chuck handle outside of the buccal area and so avoids sparking of tongue and lips.

Effects of Modified Coagulation

A connotation of the principle effects of my modification of electrocoagulation is here appended.

1 Desiccation seals those vessels left unthrombosed by coagulation. Larger vessels at margin of coagulum require extra heat.

2 Fulguration seals lymphatics superficially and prevents undue absorption of toxic products of combustion. Minimizes reaction.

3 Prevention of postoperative adhesions. Pillars and palatal folds are left dry and nonadherent.

4 Pulverization of coagulum. Extreme dehydration makes the coagulum separate away as a fine powder imperceptibly while patient gargles.

5 Sloughing of coagulum is avoided.

6 Malodor and taste avoided when dehydration is thorough.

7 Definite relief of pain due to coagulation is noted. Counter heat of desiccation and fulguration apparently lessens afferent nerve impulses.

MENTAL HYGIENE

Mental Hygiene, Its Importance to You

FREDERICK L. PATRY, M.D., *Albany*

The boast of a western senator that he knew all about horses, on the grounds that he had followed the ploughshare over the prairies most of his life, has been disputed because his claim to such omniscience arose from experience gained from only a single point of view. Our approach to the problems of mental hygiene will espouse a pluralistic one in which all pertinent facts and factors will be presented and interpreted to the end that constructive and preventive measures may be taken.

In order to clarify our understanding of the term "mental hygiene," it should be kept in mind that we are here concerned with human beings functioning as total units, the "you", "I" or "she." Anything which contributes to the well-being or detracts from the optimal functioning of the individual or group is a legitimate concern of the mental hygienist. Just as there are varying degrees of physical health, so a person may enjoy excellent, good, fair or poor mental health. It may be taken to mean the measure of an individual to adapt and adjust himself to the community life in which he lives, to meet life demands and opportunities with a minimum of friction and with reasonable satisfaction. The term "mental" as here used is not synonymous with "intellectual," the former refers to the acts and reactions of a person with respect to his environment, especially social adaptation, whereas the later term refers to discriminatory processes of conceiving, judging, and reasoning. Thus a person may have high intelligence but poor mental health.

Are you aware of the importance of mental hygiene, especially in its positive and preventive aspects? Unlike the man who said "I am open to conviction but I'm damned if you can convince me," I feel that you want the facts rather than a string of honeyed, soul-stirring phrases. The philharmonic approach with its sounding of brass and tinkling cymbal has been so overplayed in an attempt to

arouse interest in the solution of current economic, political, and social problems that a realistic facing of facts may seem in order. Since most of us begin to squeal when our pocketbooks are hit, let us acquaint ourselves with a few of the results of failure to develop an adequate preventive mental health program.

During the past twelve years the State of New York has invested 130 million dollars in new institutions for the care and treatment of the mentally sick. At present there are approximately 65,000 mentally sick (the word "insane" should be restricted to medicolegal usage) patients in state civil hospitals, 3,000 in hospitals for the criminal insane, 12,000 in state schools for mental defectives, and 2,500 epileptics in Craig Colony. The number of mentally sick persons confined to private hospitals, sanitariums, nursing homes, and psychiatric divisions of general hospitals would considerably swell the above census. Moreover, there is likely a larger number of persons suffering from mental illness of varying degree not being treated in institutions. This group floats with partial disability in the home or at work, a terrific strain and burden to the community. Little does the average citizen hear of this significant ambulatory group of mentally sick persons attempting various degrees of socialization until some antisocial behavior is expressed. At the present time the newspapers are strikingly acquainting us with gruesome details of mentally sick persons running berserk.

When you are making out your income tax statements, keep in mind that no small part goes to defray the cost of maintenance of mentally sick persons in state institutions. This amounts to some thirty million dollars annually. But more significant from an economic standpoint is the loss of earnings of persons disabled by mental disease. In New York State this amounts to 129 million dollars, and in our nation some 700 million dollars.

Does there not appear to be signs of

Read before the Women's Auxiliary of the City Hospital, Schenectady, April 13, 1937

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D , Dr P H , New York City

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital. The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Sex Stupidities

She is only nineteen and been married for one year and a half. Has no occupation except some very light housework. Full of superstitions about sex, is unhappy because so far she has not become pregnant. She has attacks of restlessness, mental instability, when she insults her best friends, starts fighting, and throws them bodily out of the house. Sometimes she mistreats even her husband, who is exceptionally kind and forbearing with her. She is convinced that she must become insane because some member of her family is mentally ill.

Her husband is twenty-five, robust and very much in love with her. She seems to care for him, but is surely not very enthusiastic, although she says "We're both in love and passionate." No, there is no other man.

She is almost as tall and strong as he is. She is physically in good health and her menses are normal. His semen proves to be abundant with energetic spermatozoa and his sexual act which she demands about five times weekly, is completely satisfactory, as far as he is aware.

But she claims to remain ungratified and masturbates after each relation, without the husband's knowledge. She does it at other times also, every day and several times daily, by rubbing the clitoris. It is an old habit with her, since the age of fifteen. She has never read anything about sex, but has heard that the clitoris was the organ for obtaining an orgasm. Therefore, "she cannot see" how the coitus in the vagina can be of any help. She is doing it through a sort of theoretical conviction.

But, on the other hand, she is afraid that the behavior "interferes with conception." Hence the conflict.

During our conversation it is explained

that masturbation has no effect upon pregnancy. Also about the vaginal orgasm and the role of the clitoris, about her upbringing which makes her expect exaggerated sensations. Then she is told that masturbation, whatever its origin in her childhood, is entirely unnecessary in her case and that she can undoubtedly get rid of the habit. She has wrong ideas about sex life. It is a shame, an insult to nature that in the presence of this splendid, vigorous young man who comes to her with all his love and desire, who should represent to her, as it were, the entire creation, she needs a poor, mean substitute. She is bound to make him deeply unhappy, perhaps in the near future, and eventually to wreck her own life. She must decide whether she loves him or not and then act frankly and honestly according to her feelings, etc., etc.

These words, finally, have their effect. She is also taught about the possible result of excessive intercourse and excessive irritation both upon her and her husband, she is told to sleep separately so as not to cheapen the sexual relations, which should always be a thrill, a holiday. Being too much used to one another's body makes it a humdrum business. She is directed to have some outside interest and to plunge into some activity that would engross her. She will conceive some day. There is no hurry about it at her age. It is best for her not to concentrate on this thought. She is assured that the case of insanity in her family is not at all a danger for her.

Within less than a year this marriage became a success as far as a marriage can be, and stayed so. The young woman was mentally normal and the first baby arrived two years later.

AND THEN THERE'S THE 19TH

Just as the dentist was leaving his office the telephone bell rang. He answered it and found that it was a patient wanting to come that afternoon. "I'm afraid I can't give you an appointment for this af-

ternoon," the dentist replied. "I have 18 cavities to fill."

And he hung up the receiver and hurried off to the golf course.—*Illinois Medical Journal*

large number is due to head injury received in accidents of various kinds in the home, industry, and particularly on the road. Thus the need for efficiently directed safety education programs by our schools, health departments and other safety-minded groups.

Since people are in general living to an older age than a generation ago, we naturally expect an increase of mental disease due to cerebral arteriosclerosis and senility. This same condition obtains in the realm of physical diseases in certain instances, for example the increase in diabetes, cancer, heart and vascular affections in the upper age brackets. This trend would point to the need of emphasizing a preventive mental hygiene program for those in middle life and beyond. The art of living wisely and well here, as indeed should be the case all along the life span, demands more critically directed effort.

But our greatest challenge from an educational and preventive point of view lies in the field of so-called functional mental illnesses which amount to over sixty per cent of institutional cases, and a still larger number of extramural patients. As far as we know they have no structural defect or disease. They are victims of inadequate habits of adjusting to various stresses and strains encountered along life's highway. The original stuff out of which a certain number of these patients was made may not have been as stable or as solidly put together as in the case of the so-called normal. But little will be gained by blaming heredity. Our job is to so shape environmental stimuli and pressure that hereditary endowment may have the best chance to flourish. This does not gainsay the need of a positive eugenics program.

Let us erect a few guideposts for a mental hygiene program keeping in mind that health is a relative and highly individual matter and therefore suggestions should ideally be tailor-cut to fit personal needs.

1 Parental and pre-parental education may be referred to as education of the unborn child and it is here that our greatest hope of a better adjusted generation lies. Granted that common sense consideration is given to the selection of a mate since undesirable constitutional or ingrained tendencies may be accentuated or

modified by wise mating, the rearing of the child through the years one to six should be of focal concern. The basic patterns of adjustment to life are woven into his plastic and sensitive personality at this time. Their texture and quality largely determine his success in latter life adaptation.

2 The school has the second opportunity, at least in an organized way, to constructively unfold the child's nature and direct its development. The happy child is perhaps our best indication of the educational shoe fitting the child. Schools should primarily be *diagnostic* centers if educational treatment is to be rational. We must know his level of ability and kind of ability if his curriculum is to guarantee him the habit of success in achievement and in social integration. Adequate educational and vocational guidance will be invaluable in helping him find his occupational niche for which he is best equipped to effectively fill.

3 Since we are largely creatures who live by habit, a well-balanced program of work, play, rest, sleep, relaxation, diet and elimination will prove a sheet-anchor in daily life. In these days of enforced leisure time we should not forget the mental hygiene values of social participation in cushioning our anxieties and in maintaining an objective attitude toward life. On the other hand the value of work as a stabilizing and sustaining force cannot be overemphasized.

4 Recognizing the need of challenging conflict, tension and risk for mature development, we also must assure ourselves of adequate security and affection. There is such a thing as wholesome failure but the prevailing life adjustment pattern must be one of success and satisfaction in the business of living. The feeling of belonging, of being wanted and loved, or at least constructively socially regarded, are essentials of our emotional atmosphere.

5 Since the person always reacts as a total unit we should make sure that the part-functions are in optimal working order. Of particular importance is the physical substratum of mental life. Thus annual and semi-annual physical examination (including dental examination) should be espoused. It is cheaper to prevent illness than to pay doctor bills after sickness has overtaken us.

surcease in this day of science? No. On the contrary, since the years immediately following the World War, there has been a steady increase in the admission rate to state institutions. At present there are about 13,000 new cases a year. Re-admissions or lapsed cases returning to state hospitals number 3,000. The net increase of admissions for the mentally ill is 2,500 per year, and about 600 for the mental defectives and epileptics combined. It would appear that an adequate building program indicates a new hospital every two years for 5,000 new cases. The per capita annual cost is \$350 to \$400 exclusive of housing or capital investment charge. It costs \$4,000 to build a hospital per patient, or \$4,000,000 for 1,000 hospital beds. About one person in every twenty in this state will at some time in his or her life be admitted to a hospital for the mentally ill. There are more persons confined in mental hospitals than there are in all other types of hospitals combined. Truly the staggering problem of mental disease and its prevention is number one public health challenge today. If we include delinquency and crime as products of an inadequate mental hygiene program, with its national toll of some thirteen billions of dollars, our task demands the intelligent and active support of every man, woman, and child. What can we do about this appalling octopus?

The institutional cost for care and treatment of the mentally sick augurs well for increasing reduction by virtue of critical paroling as soon as it is safe and beneficial for the patient. Of particular promise in this direction is the family care of carefully chosen patients. In Europe this method has reached larger proportions than in this country. Moreover, newer methods of treating certain mental illnesses (particularly general paresis and dementia precox or schizophrenia) are significantly contributing shorter treatment and earlier parole. But the problem of treatment of full-blown cases of mental illness although very important should not be our point of chief concentration of interest and expenditure of material and human resources. We must look to the causes of the various types of mental illness and seek to enucleate or modify them. Thus the preventive psy-

chiatric or mental hygiene approach must challenge our critical capacity for capitalizing our needed resources. Let us briefly inspect a few worthwhile causal factors to tackle.

We definitely know the causes of mental diseases due to alcohol and syphilis which amount to some ten per cent each of total institutional cases. We do not expect human nature or intelligence to wipe out the manufacture of alcohol from the face of the earth. But we do feel that an effective program of temperance education (and this also applies to eating, work, recreation, rest, sleep, loafing, and all other human activities) may teach habits of self-control which will safeguard the individual from excesses and teach him the advantages and satisfactions of abstinence in many or most instances. The individual must learn to sense his stride or pace and keep well within it if a margin of safety is to obtain. We must also recognize a wide variation in individual differences in capacity to withstand the temptation of exposure to alcohol and the need of protecting the emotional and volitional infants from themselves and others whom they affect. For those who voluntarily reach out after alcohol for various reasons, education in the art of drinking from the standpoint of individual limitation and influence on others may find a significant place. Of growing moment is the relation of alcohol to accident frequency. The alcoholic driver must be banished from our highways.

In the case of syphilis as a cause of mental and physical disease, the State Department of Health is courageously acting as a spearhead in making available scientific knowledge concerning sources and methods of infection and sound methods of early diagnosis and treatment. It has been said that if extramarital sexual intercourse could be eliminated syphilis would disappear in a single generation. Effective methods of sex education, euphemistically called "social hygiene," is a crying need of today.

Another unnecessary and therefore preventable group of mental illness arises from injury to the central nervous system. Some of these are attributable to birth injuries which may be largely prevented by more adequate obstetrical care. But a

Draco (621 B C) had established a death penalty for rape and seduction as well as adultery, and he was followed by Solon who legally established prostitution. And this is a classic conflict of civic ideals in two administrations representing changes in the mores and variations in moral standards. To denounce or accept legally involves a shift in moral viewpoint. Man changes his institutions and is changed by them, but how deeply is he changed?

John Locke commented, "Men I think have been much the same for natural endowments in all times." This viewpoint was further developed by Buckle who stated, "Whatever, therefore, the moral and intellectual progress of man may be, it resolves itself not into a progress of natural capacity, but into a progress, if I may say so, of opportunity, that is, an improvement in the circumstances in which that capacity after birth comes into play." In support of this doctrine he stresses the contrast between the stationary aspect of moral truth and the progressive aspect of intellectual truth. His viewpoint is supported by Sir James Mackintosh. "Morality admits no discoveries. The fact is evident that no improvements have been made in practical morality."

This viewpoint has not always been accepted. Lecky, for example, maintained, "It is quite certain that morals exhibit as constant development as intellect, and it is probable that this development has exercised as important an influence upon society." He recognized, however, that the moral changes have been due more to emotional quickening than to intellectual judgments. This being true it is obvious that the changing intellectual growth, for some reason called civilization, would not be markedly effective in shifting the morals of generations if such generations were exposed to a different series of emotional stimuli. And aren't they all? Tylor in "Primitive Culture" regarded morality as "an essential variable, progressive, perfectible, that is a reflex of wants, of usages, and of circumstances. What is good here is bad elsewhere—as to take care of one's infirm parent or bury him alive." For him "Morality or ethics signifies the act of conforming to the manners of society to which we belong. There are no two races in the world which have exactly the same code of morality, but each has its own which is

sanctioned by public opinion." One may go further than this by saying that different generations possess their own sanctioned codes just as markedly as do different races. And it is the nature of these fluctuations in sanctions and the conditions giving rise to them that creates much of the annoying differences constantly revealed between the older and the younger generations.

Theophrastus writing on "Impertinence" in approximately 343 B C describes the man who, "When he begins to be warm in his Discourse he says the world much degenerates and the present age is more wicked than the former." De la Bruyere, writing late in the seventeenth century concerning Theophrastus' exposition of *The Moral Characters* stated, "Now, those whose manners Theophrastus paints were Athenians, and we were Frenchmen, and if we add to the diversity of Place and Climate, the long interval of time and consider that this Book was wrote in the last year of the CXV Olympiad, three hundred and fourteen years before the Christian era, and also that 'tis above two thousand years since the people of Athens liv'd, of whom he draws the picture, we may admire to know ourselves there, our Friends, those whom we live with, and that being defiant to each other for many Ages the resemblance should be great. In short, Men in their Souls and Passions change not but are still the same as they were, and as they are described by Theophrastus, Vain, Dissemblers, Flatterers, Selfish, Impudent, Importunate, Distrustful, Backbiters, Quarrelsome and Superstitious."

Plutarch giving his views on life states in his book of morals written during the first Century A D "but the faults of young men are often grave and serious, as gluttony, and robbing their fathers, and dice, and revellings, and drinking bouts, and deflowering of maidens, and seducing of married women. Such outbreaks ought to be carefully checked and curbed. For that prime life is prodigal in pleasure, and frisky, and needs a bridle, so that those parents who do not strongly check that period, are foolishly, if not unawares, giving their youth licence for vice." They did not talk of the Revolt of Youth in Plutarch's time, they merely wrote of youth.

During the early period of the new era, laws on morality were what today would be called exceedingly lax, and the freedoms

6 Seek a critical consensus of opinion to assist you in maintaining an objective attitude toward life adjustment problems. A confidential relationship with others will not only act as a safety valve for anxieties and fears, but also may give you new points of view which may prevent as well as reduce unwholesome tension. It should assist you in gaining insight into the motivations of behavior and in being mentally honest with yourself and others.

7 Keep ambition and standard of living in hailing distance with your capacity to reasonably satisfy them day by day.

8 A wholesome sense of humor and of the ridiculous will help you laugh at your own mistakes as well as the foibles of others.

9 Mental health attitudes and practices are largely caught rather than taught. Wholesome as well as vicious emotional reactions and patterns are readily absorbed, especially by the sensitive growing child. We cannot be neutral in influencing the behavior of others. We are constantly radiating personality development values at all times. It therefore behooves us to take a critical inventory of our prevailing reactions since few of us are beyond the stage of improvability. Take care where you ventilate your complaints and troubles.

10 Knowledge of the determinants of the behavior of yourself and of others is desirable if positive growth and planning for better personality functioning is to

flourish. We need to gain the habit of *interpreting* conduct rather than judging it. Behavior is merely a symptom of the individual seeking satisfaction — security, affection, mastery, social recognition and approval, and a feeling of being wanted and belonging to the group which he respects and admires. Thus growth in experiencing a "satisfaction formula" to meet individual needs is essential if we are to realize a larger degree of maturity in personality functioning—self-direction, self-reliance, self-sufficiency, self-criticism, and self and social control. We have mentioned the desirability of early diagnosis of abnormal physical functioning. It is just as important, or more so, that periodic mental health stock-taking by yourself assisted by a specially qualified mental health physician be made a regular periodic practice. The prevention of the tremendous economic burden of mental illness, not to mention personal suffering and family misery, lies in early diagnosis and treatment of unwholesome deviations in individual patterns of life adjustment. To this end child-guidance clinics, mental hygiene and psychiatric clinics, and the physician specializing in psychiatry stand ready to help you.

Home, school, church, and every constructive community agency has its unique role to play in assisting you enjoy good mental health.

214 STATE ST

And It Ever Will Be Said Of Youth

IRA S WILE, M D, *New York City*

The gray-haired philosopher regretfully and sadly remarked to the young cynic, "Things are not as they used to be." And the young cynic eagerly and gladly remarked to the gray-haired philosopher, "No, they never were." This represents in brief the situation of the age-old conflict between two generations.

The cycle of moral development appears to be one of generation, degeneration, and regeneration. Infancy and childhood are building up in terms of social patterns, adolescence and early maturity are struggling against rigid mores, middle age and senility are protesting, demanding, even

when regretting, the necessity for the acceptance of their ancient laws, regulations, and patterns of behavior.

The relation between the period of degeneration and of regeneration is always of interest and ever seems to be of importance. To each age it presents its peculiar form and structure and its special mode of expression. Let us stress briefly and in part evidence of the recognition of this conflict without any special comment or discussion to show how right the young cynic was when he answered "No, they never were."

A great conflict in viewpoint was manifest in Athens 2,500 years ago. The Archon

State Medicine?

Our society is on record, through the action of its House of Delegates, as opposed to State Medicine. Meanwhile events are transpiring, and pertinent facts are being established which we here note.

It has often been argued that a fact is a fact only in virtue of the evidence put forward in favor of it. Where evidence is absent, no facts are established. Sometimes scientific facts are established as such by inference only. Occasionally a fact is established by inference plus a certain amount of evidence. As Al Smith was wont to say, "Let's look at the record," and establish the evidence which adduces the facts that we are already being surrounded by "State Medicine," and then let us ask ourselves what we are doing about it.

Massachusetts,¹ making a study based on a survey of five hundred families in regard to the adequacy of medical care, showed that 13.4 per cent of those who were studied, were found to need medical care that was not obtainable. Fifteen per cent reported that finances prevented the use of a physician. True, the number investigated was not large, the group consisting of only 1,820 persons. The significance of this lies in the fact that

this happened in Massachusetts, and not in some southern or outlying state. Furthermore, what we desire here particularly to stress are the measures taken to meet the situation. Massachusetts, among other things in its adopted program, asks cooperation from industrial, fraternal, social, and health organizations, and desires to establish welfare department responsibility for an intelligent administration of medicinal care for the *indigent* and the *near indigent* in each town and city by employing licensed physicians of the community at reasonable pro rata fees, and subsidizing licensed practitioners to locate where there are no physicians in residence. In other words, Massachusetts seems to conform to our view that the care of indigents are a proper charge on the community and their medical care should be paid for from tax funds.

Is this State Medicine?

At the Annual Meeting of the Medical Society of New Jersey, held at Atlantic City recently (April 29, 1937), the Society went on record as favoring a "luxury tax" to provide hospitalization of the indigent. It further went on record to urge county medical societies to assume responsibility for providing preventive medical care for all residents.

¹ J. A. M. J. 108 140 B 1937

and excesses existent and permitted as described by Salvianus, Bishop of Marseilles in the middle of the Fifth Century A D were quite in harmony with Plutarch's succinct exposition. The laws of, and for, morality first became of primary importance for enforcement under the action of the Puritan sects. In truth the confusion of moral standards that resulted from strivings against nature brought about a public sentiment in which it may be said with all propriety that the value of purity increased as virtue diminished and this condition of affairs obtained especially in the thirteenth and fourteenth centuries. Even the beautiful love story of Abelard and Heloise tells of moral standards wherein libertinism was more highly esteemed than lawful marriage.

Shakespeare writing in the latter part of the seventeenth century puts into the mouth of a Shepherd in "A Winter's Tale" words clearly reminiscent of Plutarch, "I would there were no age between ten and three-and-twenty, or that youth would sleep out the rest, for there is nothing in the between but getting wenches with child, wronging the ancients, stealing, fighting,—Hark you now!"

Ferguson's Scottish proverbs compiled near the end of the sixteenth century contained one that has ever been true "Youth and Age will never agree." This is quite in harmony with James Howell's more physiological version, written in the middle of the seventeenth century "Youth and Age cannot agree." Y Adams had a somewhat more sad view as he wrote in the first quarter of the seventeenth century, "This is the devil's dispensation, Youth must be borne with."

John Wesley giving a sermon before the Society for the Reformation of Manners in 1763 made a plea to "Lift up a Standard against the iniquity which overflows the land." The eighteenth century as a whole had its own standards of gaiety, and the lanes of Hyde Park of today are probably less adventurous than was the same Hyde Park for fashionable people during the years ranging from the reign of Charles II to George II—those gay days of flirting and intrigue with the assistance of the mask and the scarf and the hood. The days of the early eighteenth century may have presented marvelous coiffures and extensive and voluminous costumes but still it was written of Tunbridge Wells in 1724,

"Every gentleman is equally received by the fair sex upon the walks" and "you engage with the ladies at play without any introduction."

Slipping into the United States in the early nineteenth century by way of Timothy Dwight, one time President of Yale, one finds him writing in his *Travels*, "That my fair country women, especially the young women are willing to display their persons, and their dress, on proper occasions, I am not disposed to deny." And that was in an era when it was no small task for a woman to display any part of her body. Dwight quotes and weakly denies a statement made by the Duke de la Rochefoucault De Liancourt, "It is usual for young people at the age of thirteen to leave the family of their parents and go into the service of others. The parents find it vain to detain them, if they are not permitted to work as others do they will not work at home." Incidentally Doctor Dwight also makes a statement which applies today "The modern education is attended with more expense and parade, but is not productive of greater moral or intellectual improvement."

"The bounds of freakish youth" have long been recognized vaguely, but bounds have ever changed. All are not as pessimistic as was Disraeli writing in *Coningsby*, "Youth is a blunder, manhood a struggle, old age a regret." Possibly Pliny was more sane in his outlook when he stated "By Hercules! The greatest part of the evils that happen to men are from the hand of man himself." It is not possible to change the limits which are due to the time, the place, and the circumstances of life.

Man shifts the circumstances of his own generation but the circumstances shift growing youth. Each generation makes its own responses to its new world and age of trial and experiment. Youth cannot satisfy a generation that has developed because it is not exposed to the same influence, opinion, atmosphere, practices, and mores. Hence there are, as there ever have been, those to talk of errant youth, flaming youth, revolting youth.

It is time that rational elders ceased indicting and calumniating youth. Let middle age be reflective, honest, and meditate upon the splendid wise suggestions of the Talmud "Limit not thy children to thine own idea. They were born in a different time."

State Medicine?

Our society is on record, through the action of its House of Delegates, as opposed to State Medicine. Meanwhile events are transpiring, and pertinent facts are being established which we here note.

It has often been argued that a fact is a fact only in virtue of the evidence put forward in favor of it. Where evidence is absent, no facts are established. Sometimes scientific facts are established as such by inference only. Occasionally a fact is established by inference plus a certain amount of evidence. As Al Smith was wont to say, "Let's look at the record," and establish the evidence which adduces the facts that we are already being surrounded by "State Medicine," and then let us ask ourselves what we are doing about it.

Massachusetts,¹ making a study based on a survey of five hundred families in regard to the adequacy of medical care, showed that 13.4 per cent of those who were studied, were found to need medical care that was not obtainable. Fifteen per cent reported that finances prevented the use of a physician. True, the number investigated was not large, the group consisting of only 1,820 persons. The significance of this lies in the fact that

this happened in Massachusetts, and not in some southern or outlying state. Furthermore, what we desire here particularly to stress are the measures taken to meet the situation. Massachusetts, among other things in its adopted program, asks cooperation from industrial, fraternal, social, and health organizations, and desires to establish welfare department responsibility for an intelligent administration of medicinal care *for the indigent and the near indigent* in each town and city by employing licensed physicians of the community at reasonable pro rata fees, and subsidizing licensed practitioners to locate where there are no physicians in residence. In other words, Massachusetts seems to conform to our view that the care of indigents are a proper charge on the community and their medical care should be paid for from tax funds.

Is this State Medicine?

At the Annual Meeting of the Medical Society of New Jersey, held at Atlantic City recently (April 29, 1937), the Society went on record as favoring a "luxury tax" to provide hospitalization of the indigent. It further went on record to urge county medical societies to assume responsibility for providing preventive medical care *for all residents*

of their communities¹ In other words, the palliatives which preventive medicine holds out for better health protection are to be provided for everyone in the community

Is this State Medicine?

During a recent week (April 29) the hospital survey of the metropolitan area was made public At this time we do not desire to make detailed comment upon the results of this survey but one factor stands out The physicians in the metropolitan area contribute about twenty million dollars worth of medical service annually to the indigent The survey recommends that the physicians making this contribution should receive pay for this service Of course this pay will have to come from tax funds

Is this State Medicine?

The State of New York recently passed a legislative act appropriating a large sum of money for pneumonia control and for the manufacture of pneumonia sera There was no expression of any opinion that this money *was not to be spent for the benefit of all the people of this state* There was no limitation to its dispersal only for indigents or near indigents

Is this State Medicine?

Finally, in New York City, the daily papers carried the story that the division of the city's health department which manufactures sera, bought many additional horses and proposes to enlarge its facilities For this purpose a considerable sum of money was allocated There seems to be no limiting criteria, as to the disposal of the manufactured products of the department

Is this State Medicine?

We could add more evidence, but we think we have enough factual examples of a trend of the times to put the question squarely up to our membership

Surely we are having an evolutionary development of State Medicine Organ-

ized medicine must necessarily meet this problem There are definitions to be made, limitations of applicability to be developed The eligibility of individuals to participate in the use of tax funds needs careful elucidation Eventually if this factual trend with which we are confronted is allowed to run its course unguided and unregulated, government will face us with a *fait accompli* We shall have full-fledged State Medicine upon us, with private practice going on along its upper-income-earning fringe

Pondering these questions, on the eve of our state meeting, it would seem that we must first of all divest ourselves of the fear in which the very term "state medicine" puts us Because we dislike this "bogey man" is no reason that we shall not face its advent squarely We need to be realistic in this, and recognize that in the present era all the elements that are pressing for what they call social justice are bringing factors into medical practice and medical care for the people which were undreamed of in a prior period As soon as we recognize this, we will find that there is still a very important role which we as an organized profession must play to guide and if possible to control this new type of practice When the trend in everyday affairs is for government to intervene in the average life of its citizenry, then we cannot expect that the medical profession will not also have governmental intervention in its affairs Our efforts to preserve all that is traditionally fine and good in the old type of private practice need our constant vigilance and care The changes are pressing closely upon us We, too, must change to meet the general situation Trees that cannot bend to the wind, break, and their crowns are lost "They must change often who who would be constant in happiness and wisdom" says Confucius Limited state medicine is already more than approaching To some extent it is here Where are the elements in our organized profession which should be studying its encroachments upon private practice and

¹ The New York Times, page 23, April 30, 1937

who should set fair and square limitations to its growth, without prejudice to the underprivileged and with justice to the profession which has heretofore so well served their class-groups, who is it that shall say to government how far and for what specific purposes tax funds are needed to bring availability of medical care to everyone who needs it?

There never was a time in our memory when enlightened leadership was more necessary than now to preserve what is good, and additionally to meet the newer situations with planned and considered propositions

A National Bureau of Health

Our President, Dr Floyd S Winslow, struck a statesman's note in his address before the annual dinner meeting of the Cornell University Medical College Alumni Association on April 29, 1937.* He urged the formation of a national bureau of health in the interest of economy and more efficient public health administration. He stressed the fact that the bureau should be separate and distinct from a welfare bureau or department. The arguments favoring the view he presented repeatedly have been presented in these columns, and need no repetition now. Any one who approaches the study of this question from an intellectual rather than an emotional standpoint will find little with which to disagree with the views held by organized medicine

All surveys, and particularly the report of the American Foundation, have gone on the assumption that we of these United States were working and developing our future status as practitioners of medicine under a well-considered and carefully worked out national health policy. We act and think, as if there were such a policy in existence, and that its program is known to us. If there is one, we would like to know it, and begin to

study its contents and implications. Likewise if there is even a state health policy in existence, we would like to peruse it. As a matter of fact, there is neither a national nor a state health policy in existence. The establishment of a national health bureau or department, as suggested by Dr Winslow, would constitute the first logical step toward the formulation of a national health policy. There are enough experts on the pressing problems of the "medical day" in this country, but there is no central agency which can or does call them together to meet and consider planning for the nation's health and developing a sequence of events to bring into being a policy which can logically find wholehearted backing by the "socializers" on the one hand, and the organized profession on the other.

At the present moment, we need this planning more than anything else, for the instant problems are broader and more embracing than are met by the pet schemes of compulsory health insurance which, by the way, is the only solution thus far advanced by any group of thinkers on the problem. That more is needed than what compulsory insurance holds forth is evident to every thoughtful observer. The establishment of a national health agency, embracing all health activities of the government is the first necessary step toward solving the problems confronting us, and developing a national health policy.

The A M A at Atlantic City

We have told in detail the story of the forthcoming meeting of our State Society in Rochester on May 24, and in the merest outline sketched the high-lights of this important medical meeting. No one who can possibly spare the time should absent himself. Those who attend will draw dividends in relaxation, pleasure, and added medical knowledge from this meeting.

Today, we particularly desire to ask our members to attend the various func-

*See page 978, this issue, for the address in full.

tions of the American Medical Association in Atlantic City between June 7 and 11. This is the outstanding medical meeting of the year. Here you will find occasion to meet in reunion with others of your college fraternity, here there will be section meetings in all branches of medicine at which the newest and latest will be both presented and discussed. Organized medicine, through its national, democratically organized House of Delegates, will consider, discuss, and adopt policies having important implications for the practice of medicine in the future. The large scientific exhibit brings research workers and clinicians into intimate contact of inestimable benefit to both. Lastly the general meetings will provide addresses and discussions which because of the national, nay, almost international character of the essayists cannot but be both interesting and stimulating. One leaves an annual meeting of the A M A prouder than before that one holds some position in this important organization. The critics of the A M A should all attend and observe procedures and actions with an analyzing eye and an open mind. Perhaps some of them may thus see that there is little regimentation of the profession by officialdom of the A M A, that there is no dictation from above, and that whatever is determined upon is the considered opinion of an overwhelming number of the delegates elected to represent their own state organization.

Finally, we of New York have a deeper interest in the meeting this year. Dr. Charles Gordon Heyd, the President, is one of us. We know him well. Long has he worked in our midst, and he has the good wishes of the New York State organization. We also take pride in the Speakership, under the masterly gavel of Dr. Nathan B. Van Etten. These New Yorkers have brought us both pride and glory.

Is it therefore strange, that we urge New York not only to send a full delegation, duly accredited, to the National House of Delegates, but also are ask-

ing that this state send a large contingent of New Yorkers to the general sessions and the various scientific assemblies.

This is really New York's year at the A M A. Let's all go! Whatever happens, our leaders will thus know that the State they represent is unanimously behind them and takes pride in what has been achieved.

Making the Profession Articulate

Dr. Winslow, in his address before the Cornell Alumni on April 29, struck another significant factor in our organization when he said, "Physicians should take a wider interest in public affairs, and should voice their interest and the views that accompany it, in language to be understood by a taxicab driver." He deprecated the profession's reliance merely on resolutions passed by medical societies in presenting their views to the public "since such official pronouncements" were not "'persuasive'." Our House of Delegates has established a Public Relations Bureau *to do just that*. In intricate paramedical and medicosocial questions are dealt with and the news so disseminated that "a taxicab driver" can, and does comprehend their import. It is impossible to estimate the results of this work in elements that can be added together to make a total. It is impossible to estimate intangibles. It is however apparent that a better apprehension exists among the public generally, in this state, of organized medicine's standpoint, and it seems evident too, that our work in the legislative halls of the state seems easier. One is not so often confronted with the ignorant standpoint that organized medicine plays a sort of "unionized" or "guild" role. Both public and legislators, as well as our own rank and file understand better what we stand for, the goal we aim at, and the obligation we are under to protect the public.

Real Democracy

Let us hope that the United States has no need of the example in medical de-

mocracy recently set by Canada—or that if it ever has, it will follow it

A proposed plan of compulsory health insurance had aroused vigorous controversy in British Columbia. The provincial College of Physicians and Surgeons conducted a poll to determine how many of its members were in favor of participating in the scheme. The result was decisively adverse. 619 ballots against to thirteen for. When this was reported to the premier, he immediately ordered a cessation of collections pending a review of the entire situation.

These events have a triple significance. They effectively refute assertions that compulsory health insurance has the support of British Columbia physicians. They give hope that responsible officials are beginning to realize that no medical plan can operate successfully over the opposition of the medical profession. Above all, they show that it is never too late to resist a wrong—that what appears to be a losing struggle may take a winning turn in the last ditch.

Conditions in British Columbia are not so irreconcilable with the situation in this country as to forbid comparisons. Here as there agitators are trying to introduce a medical system to which the profession is opposed and for which no spontaneous popular sentiment exists. Here as there physicians are inclined to let things drift without formulating their own remedies for acknowledged ills.

Let us hope that the comparison can be carried further—that here as there a reserve of fighting spirit in the profession will struggle to the last inch for the independence and integrity of medical practice and that our government, like theirs, will respect democratic tradition in medicine.

Destructive Taxation

Senator McCall's bill imposing an additional tobacco tax to establish free dental clinics for all school children has reached a third reading. Further ad-

vancement should be opposed by every thinking citizen. There is no need for such a measure. Facilities already exist for the provision of dental service to the needy. There is no more reason to furnish such care gratis to the children of well-to-do families than there is to supply them with free food or free clothing. Available funds should be spent for the benefit of the underprivileged, not to release those in good circumstances from fundamental responsibilities.

Measures like the McCall bill create a demand for governmental service that cannot possibly be supplied without wrecking the existing political and economic structure of this country. Various forms of relief have drained the sources of taxation so heavily that they are rapidly drying up.

The middle and lower classes, in whose behalf many such projects have been initiated, are beginning to discover that there is no Santa Claus; ultimately they must pay the bill. Rising commodity costs growing out of current inflationary trends hit the small wage-earner and petty business man most heavily. Income fails to keep pace with mounting prices. The result is a lowered standard of living which menaces health.

Relief cannot be discontinued for the millions who are still unemployed or unemployable. As long as the taxpayer is burdened with this enormous load, there is no justification for the extension of governmental aid to those able to provide for themselves.

The failure of recent tax yields to come up to expectations is a warning to national and state legislatures that they are depleting the goose which lays the golden egg. The McCall bill would impose another vexatious tax on the masses to benefit a class which has no need of aid. Free dental service is already available to the indigent.

There is no limit to the number and type of services the state can be authorized to provide. The question is, how much can it afford to undertake and who pays the bill in the last analysis?

For More Assets

The report of the treasurer of our Society, published in our issue of April 15, should be carefully studied by our members for the clarity with which it describes our financial status and requirements. Dr. George W. Kosmak is to be congratulated upon his extraordinary skill in the handling of the Society's funds and the caution he exercised in the selection of its investments.

To one of his statements we desire to call special attention. "The status of your Society's treasury may be termed as satisfactory but with the general financial condition of the country more or less uncertain and future returns from the sources of our income possibly effected by changing conditions, it remains to *conserve to the highest degree the principle of your assets*" (Italics ours). We add to this that it is extremely urgent for us to increase our tangible assets materially.

The largest item in our income was from membership dues, which figure was just \$6,425.80 more than our total expense of \$136,674.20. The excess of all income over expenses was \$17,646.55. With the ever-changing trends in legislation confronting us, and with the possibility that certain pressure groups might force a change in the present system of medical practice to the detriment of the public and the profession, we must be prepared to guard the interests of our patients as well as ourselves. To do this requires money. A glance at the detailed expenditures shows conclusively that they are being held to a minimum. In fact each year, more and more problems confront the Society and their solution places a steadily increasing tax upon its treasury.

Some plan must be evolved to augment our income and substantially bolster our surplus against the time when we may require it. The House of Delegates might well place this question on its agenda and our members should give

this serious thought in their County Societies. We most imperatively need a larger nest-egg.

Coronary Sclerosis Among Doctors

Is coronary sclerosis an occupational disease? One cannot help arriving at this conclusion after having read the studies of Smith¹ concerning the incidence of this disease among various groups of our population. His figures show that coronary sclerosis occurs least often among those who do manual labor and most frequently among those who do mental work.

Of the latter group investigated, which included clergymen, lawyers, bankers, and physicians, the incidence rate of coronary sclerosis was twice as great for the doctors as that noted for the other professions. In speculating upon the reason for this, Smith writes "A physician's routine work, which includes ordinary obstetric cases with their complications, broken legs, severe cardiac diseases, scarlet fever and diphtheria among children and pneumonia among the aged, and the responsibility of the surgeons which is probably greatest of all, is actually or nearly as intense as that of the banker when there is a run on his bank. In other words, what is a crisis for the banker and business man is more or less routine for the physician."

What shall we do about it? We are not able, because of the very nature of our work, to follow the advice we give our patients. In spite of the high incidence of coronary sclerosis among us (107%) the "show must go on" and "it will ever be thus" as long as there are doctors and the sick to whom they minister. *Sic transit gloria mundi*.

CURRENT COMMENT

BALZAC ONCE SAID, "Bureaucracy is a giant walled by pigmies. It has a natural

¹ Smith, H. L. J. A. M. A. 108:1327, 1937.

tendency for mediocrity, a predilection for statements and reports, and is as meddling as a small shopkeeper's wife. It has shirked every question, protracted delays and perpetuated abuses, the better to protect and perpetuate its own existence"—We thank the St. Louis County Medical Society *Bulletin* for calling our attention to the above

DR ELLIOT C CUTLER, Mosely Professor of Surgery at Harvard University, wrote to *The New York Times* under date of April 7, at some length regarding an editorial of theirs on "Doctors and the Public." He states "You have obviously discerned the fact that all within the profession are not in harmony upon how to better care for the health of the public as a whole. You have noted that organized medicine is still vigorously opposed to the State intruding itself into this field

"We must be cautious in what steps we take, for on the whole the profession of medicine has done more for the good of the people than any other profession. It has itself repeatedly 'cleaned its own house,' so to speak, stiffened the requirements for the education of the doctor, weeded out poorer medical schools, and given liberally of its time for the care of the needy and suffering members of society

"This long and honorable course of the profession of medicine scarcely deserves to be jettisoned, as some would say, in order

that we may immediately turn over the care of the public health to the State. We have had experience already with the government care of less vital projects, to our dismay, and there lies in medicine still an impenetrable matter in the personal relationship between doctor and patient that should cause us to hesitate throwing it overboard. I happen to be one who believes that in an enlightened state the State itself may well play an important role in the care of the people. We have seen Sweden do this with great benefit to the public welfare, and we should be able to do as well. But in changing from one order of things to the next we should work slowly, and the planning that is to go forward must be cautiously and intelligently carried out, and this is not a matter for the moment."

"THE NECESSITY OF CREATING the unification of man in order that he may live happily in the modern world gives the physician a unique position of opportunity and responsibility," declared Dr John Dewey of Columbia University, in an address at the convocation of the American College of Physicians in St. Louis

"STATE MEDICINE IS A plush horse upon which a scheming bureaucracy rides ruthlessly into public power and destruction of that same public which supports it."—We have the *Illinois Medical Journal* of April to thank for this metaphor in regard to state medicine

THE NEXT STEP IN SAVING BABIES' EYES

Nearly thirty years ago, the National Society for the Prevention of Blindness began a war against ophthalmia neonatorum (babies' sore eyes)—a disease causing blindness to the newborn, through the presence of germs in the birth canal of the mother

Although the use of prophylactic drops at birth was known to be an almost infallible preventive, it was not until their use was made mandatory that the incidence of blindness caused by ophthalmia neonatorum began to drop, until now it has been reduced more than seventy-five per cent.

Today the National Society for the Prevention of Blindness feels that the problem of blindness or damage to vision from syphilis must be attacked with the same concerted vigor that resulted in the phenomenal

reduction of ophthalmia neonatorum, says *The Sight-Saving Review*. It is an established fact that prospective mothers who have syphilis can bear healthy children if prenatal antisyphilitic treatment is administered in time. A blood test is the universal method of determining the presence of syphilitic germs. The Society therefore joins all interested agencies in sponsoring measures which make it mandatory for routine blood tests to be made on all expectant mothers by their physicians—whether they be private or clinic patients. By discovering, and following up with treatment, all syphilitic expectant mothers, we may hope for a marked decrease not only in blindness and defective vision but in human misery and wretchedness, if not utter tragedy

Low Protein Diet

850 Park Avenue
New York City

To the Editor

Under the noble designation of Nutritional Review, is it permissible to present an ill-digested and discriminatory resume of scientific literature? In the April first issue Doctors Pollack and Dolger present an Alpha and Omega which few of us are willing to countenance.

Being a review, it is wholly unnecessary, we agree, to insist upon a practical point of view. However, when pretence is being made to clarify the field of nutrition, and to remove misrepresentation and distortion of facts, it is far from becoming in this effort to introduce further factual errors as the authors inadvertently accomplish in their second paragraph.

The statement that leafy vegetables contain a minimum of two per cent protein is a definite error. It is granted that the analyses of soy bean meal, dried navy beans, dried lima beans, dried peas, macaroni, peanut butter, and whole-wheat bread are correct, in the raw state, but research reveals few instances demonstrating the ability of the human to eat the dried peas, beans, flour or the alimentary pastes in the raw.

Macaroni in the uncooked state does contain thirteen per cent protein but when boiled the protein content drops to three per cent. This cannot be considered a high protein food.

The recommendation of dried meats and fish to obtain a high protein intake is little short of ridiculous. The number of these items which are edible in the dried state is distinctly limited and aside from a type eaten by the Portuguese and Spanish peoples, they are eaten, in very small quantities, as appetisers. The pleasurable volumetric limit of intake of peanut butter cannot be taken with any seriousness as for protein content.

One cannot help wondering at the *raison d'être* for the review. The most recent data is already six years old. Only three out of seventeen references fall within this decade. Half the citations are dated from 1866 to 1910—quite old enough for historical significance only. Forty-one per cent of the references are in languages other than English. That in itself makes the article authentically high-hat.

The writers, of course, have a point to sell. This should have been underscored, bold-faced, or otherwise designated. Since the authors failed to do so, let us do it now. "It is virtually impossible for the average individual to avoid consuming an adequate amount of protein." How comforting for both patient and doctor alike!

The review is all the more pernicious in that it is couched in such readable terms and decorated with names illustrious enough to cast a scientific halo about the article. The very pithiness of the quotations causes us to imagine that the original investigators might be startled by the nakedness of their words.

Of course, we may be guilty of gross, though not malicious, misunderstanding of the authors' purpose in presenting this paper. Nevertheless, it strikes us that Pollack and Dolger have chosen to report only such data as serve their purpose. Take the experiment that Deuel performed upon himself, for instance. They might at least have spelled the name correctly—a minor detail, no doubt, and probably not even their fault. First of all he was in good condition before he started on his sixty-three day ordeal. In the second place he was not trying to find out at what protein level he functioned best; he was carrying out a drastic experiment to rob his body of its "deposit" protein so that he might ascertain something of the fundamental biochemistry of the body. His diet consisted of sucrose, cornstarch (some of it eaten raw in aqueous suspension), centrifuged orange juice, lettuce, codliver oil, and an artificial mineral mixture. Pollack and Dolger neglected to mention that the basal metabolic rate fell, that body weight suffered a gradual loss, that there were periods of intermission when the subject indulged in the usually-accepted protein diet, that in period five of the experimental series "a slightly larger amount of protein was given on account of extreme nausea which had been caused by the previous diet."

Granted that Deuel "readily carried on his laboratory and other duties," somehow we just do not reach the conclusion that such a regimen is exactly the sort of thing the doctor could heartily recommend to a sick patient or to a college athlete for that matter. No fair-minded person doubts but that Deuel demonstrated that "the true endogenous metabolism in the case of a normal adult male is slightly less than ten grams

daily" Nevertheless, we would hardly preach that everything will be Utopian once we all arrive at eating ten grams of protein as our daily ration. It is one thing to be a guinea pig and cause the body to reveal its secrets by forcing a chemical show-down, it is quite another to experience vim, vigor, and vitality.

On March 15, 1932, Drs. Ashe and Mosenthal, under the title "A Study of the Average Diet," read at the section of Medicine at the Academy of Medicine, presented a resume of the protein, salt and fluid consumption of 1,000 residents of New York. This paper showed that the protein intake was forty plus grams per diem.

This article appeared in the April 3, 1937, issue of the *Journal of the American Medical Association*. However, the conclusions, although previously unpublished, have been common knowledge among those interested in nutrition and have received text-book and periodical acknowledgement.

On page 634 there is what appears to be a contradiction of facts in the reported observation of the German people during the World War. Von Muller observed that the intake of thirty grams of protein daily produces all the symptoms of protein deficiency, which was in itself an acknowledgement of the nutritional status of the race. The truth of the quotation from Lusk still obtains, but it is certainly no proof relative to an adequate protein intake.

The serious part is that some one is bound to take Pollack and Dolger seriously. We thought the profession had pretty well learned the folly of protein restriction in nephritis. Are we to discard all the accumulated knowledge of clinical medicine in return for a few scientific bouquets?

If I am to believe that the final sentence is the resume of this erudite piece of work, the conclusion to be derived is not only erroneous, but based upon not only inaccurate facts but inaccurate deductions made from real contributions to American literature.

We have no quarrel with the results of earnest research, but facts still have to be interpreted, and we feel impelled to protest lest the attitude characteristic of such irresponsibility infect that generous slice of our readers who find it troublesome to exercise their gray matter. The more so should a hue and cry be raised if this be but a sample of what is yet in store for us from the same source.

Very truly yours,

MILTON A. BRIDGES, M.D.

April 21, 1937

More Anent Diets

515 Park Avenue
New York City

To The Editor

I wish to protest against the statement made in the April 1 issue of the *STATE JOURNAL* by Herbert Pollack, M.D. and Henry Dolger, M.D. in their article "Nutritional Reviews I—Protein Requirements." The statement is as follows:

Bayliss, the English physiologist, made the pertinent remark "Take care of the calories and the protein will take care of itself."

This statement may be correctly quoted, but it can hardly be approved. The general practitioner who has labored with his diabetic cases to get the carbohydrate intake adjusted and the proper protein balance maintained will hardly be in accord.

One who endeavors to combine the service of old-fashioned family physician with that of modern medical science and take care of lives instead of merely repairing bodily damages, often sees in the field of adolescence both young men and young women commonly damage themselves by an excess of carbohydrates or a deficiency in proteins.

If Pollack and Dolger mean that, if we manage to control and keep down the carbohydrate and fat calories in the diet, then the patient or health client will be forced to increase his protein intake, then we can approve the implication, however much we disapprove the direct statement.

We welcome careful studies of nutrition. We need reliable information, and it is not too plentiful. We should be glad to be corrected if we are wrong in believing that from eighty to ninety grams of protein are a reasonable daily standard for adjustment of the diet of the adult.

We are slow to be convinced by new and fanciful theories. But while we are glad to see reference to work done by Pettenkoffer and Voit in 1866, yet we miss some references to work done in nutrition since 1931 with which the authors may be familiar, but to which they do not refer. We were under the impression that some of the recent work was really promising.

The article will cause considerable comment. It was a good thing for the *JOURNAL* to publish it. We need to be stirred up.

Faithfully yours,

C. WARD CRAMPTON, M.D.

April 29, 1937

Lymphogranuloma Venereum as a Cause of Rectal Stricture

509 W 155th St,
New York City

To the Editor

"To take issue," is a high privilege and a divine right, to employ such terms as "undoubtedly" and "I have no doubt" in an opinion concerning the etiology of disease in a group of cases never seen, known only through a brief article which totally disregarded the problem of etiology, is low comedy

In the paper which originally appeared in the March 1 issue of the *Journal*, I stated in what I had considered clear terms, "The etiology of rectal stricture is debatable. *The problem of the obstetrician transcends etiology*." As to whether or not the etiology of rectal stricture is debatable, Dr Kassebohm and myself ventured to consult Dr L T Wright on the subject. Dr Wright does not have the "privilege of observing" original work on the subject, he is doing that work. In his opinion there is no doubt that the etiology of rectal stricture is not entirely a matter of lymphogranuloma venereum

The etiology of stricture holds no interest for Dr Kassebohm or myself unless such knowledge would serve to melt away the stricture. We are interested in the management of labor in the patient who demonstrates a rectal stricture and, unfortunately, the cause of that stricture has little or no effect on the problems of labor. We trust this makes our viewpoint a bit more lucid to Dr Rothman

I must state too that we have no regret concerning the failure to employ the Frei Test in this group of cases. The results of such tests would in no way alter the plan of management we originally suggested. The Frei Test is employed often enough in the study of Dr Wright's cases and Dr Wright is still pondering the test and its complete significance

To Dr Rothman we extend a cordial invitation to discuss the etiology of rectal stricture, not with us but with the source of the statement with which he is in disagreement. We extend too an unbounded admiration for one, who from a great distance and perhaps by some God given telepathy, can, without ever seeing a patient,

venture an opinion free of doubt and unsullied by uncertainty

Very truly yours,
MILTON J SCHREIBER, MD

P S I must state with a thousand regrets that after many readings of Dr Rothman's letter (published in the April 1 issue of the *JOURNAL*) I have yet to find in it those important facts which I had not correctly evaluated. The letter had as its ostensible purpose the pointing out of those facts

April 28, 1937

An Appeal for Old Medical Instruments

28 Eagle St.
Albany

To the Editor

I wonder if this letter might find its way into the pages of the *JOURNAL*, for, as time passes, the worth of the effort that is being made becomes harder and the profession is losing some of its valuable data on its material side

Dr Chas C Adams, Director of the State Museum, State Education Building, Albany, N Y has been for some years collecting old instruments, books and other material pertaining to the medical profession, having in view some day to give an historical survey in the mechanical line, of medicine in the State of New York.

He is anxious to obtain any old medical, veterinary or dental instruments which may be added to the collection and I hope this letter may reach some of the members of the profession whose predecessors had old instruments which have descended unto them

Any gift to the Museum should bear a tag on which is written the name of the instrument, by whom used and the approximate date of its make, together with the name and address of the donor and date of the gift.

While it may be some time before he can complete his project, yet all such gifts will be preserved in the safe in the State Education Building to the credit of the donor

Sincerely yours,
JAMES N VANDERVEER MD

April 5, 1937

"The process of thinking draws the blood from the feet to the head," an educator informs us. This explains, perhaps, why, in

so many cases, if you think twice about a proposition, you get cold feet.—*Atlanta Journal*

PRIZE FOR REPORT ON CASES OF PNEUMONIA

The Advisory Committee on Pneumonia Control of the New York State Department of Health offers a prize of one hundred dollars for the best report of a series of cases of pneumonia

The competition is open to all physicians residing and practicing in New York State outside of New York City. Interns in hospitals may compete but the report in all cases should include only those cases actually seen and studied by the writer, and should include all cases of pneumonia of all types and forms treated by him either in private practice or in hospitals during the present winter

In awarding the prize less stress will be laid upon the number of cases than upon the objectivity exhibited by the writer in his description of the cases and upon the originality and independence shown in the interpretation of the clinical features. Credit will be given for the extent to which the newer methods of diagnosis and treatment of cases of lobar pneumonia were employed. If the writer desires, the report may be documented by full clinical histories and laboratory reports, but the report itself should not be longer than 5,000 words and be in a form suitable for publication in the NEW YORK STATE JOURNAL OF MEDICINE

Reports should be in the hands of the Committee not later than August 15 and the award will be made October 1

Address further inquiry to

Dr Edward S Rogers,
Director, Bureau of Pneumonia Control,
New York State Department of Health,
Albany, N Y

Annual Meeting

Fourth Day Program—Thursday, May 27

1 Sight-seeing Shopping Informal visits to Memorial Art Gallery, Rundel Memorial Building, and Rochester Museum of Arts and Sciences

2 Highland and Durand-Eastman Parks are very attractive during May Lovers of nature will enjoy the collections of flowering shrubs, particularly the lilacs, rhododendrons, and azaleas

3 For those who would like to visit the great factories and laboratories of the Eastman Kodak Company and the Bausch and Lomb Optical Company, special arrangements will be made It will be necessary to register for these trips at the Registration Booth

4 The laboratories and clinics of the School of Medicine and Dentistry of the University of Rochester will be open to visitors during the morning Operative gaiter clinic at the General Please register

5 Golf will be the feature of the day The Inter-City Academy of Medicine Golf League, which includes the cities of Rochester, Buffalo, Syracuse, Utica, Toronto, and Hamilton, will hold its annual competition with the golfers of the State Society The League tournaments every year attract a large group of golfing doctors Although there will be but eighteen holes of play the scores may be used in many individual and team contests All events except the individual championships are on a handicap basis A method of handicapping will be employed which will give every one a chance, no matter what kind of a game he may play Among the contests will be the Lilly Trophy Competition, for Academies of Medicine, the individual championship of the state, the individual championship of the League, and several other contests where Lady Luck instead of skill will

count. A handicap contest for seniors, open to doctors who have attained sixty years of age, a left-handed doctors' handicap, and special team matches between Toronto and Hamilton, Rochester and Hamilton, Syracuse and Buffalo have been arranged Other cities may arrange contests if desired

At the conclusion of the tournament there will be a banquet in the ball-room of the club, during which prizes will be awarded

The fee for the golf tournament is four dollars This includes entry fee, greens fee, and banquet It does not include the caddy fee, which is one dollar for eighteen holes

Because of the large, yet unknown number who may desire to play, it is necessary to know several days beforehand the probable number of entries The difficulty of securing three hundred extra caddies on the afternoon of a school day is obvious Those who enter early will be assured a caddy and preference in starting time If prevented from playing, for any reason, all fees will be returned except the expense fee of one dollar

The tournament will be held at the Oak Hill Country Club where two championship courses are available. Players may start at 10 00 A M and 1 00 P M

The sole object of the tournament is to promote good fellowship among the widely scattered doctors of New York State and Canada It is not necessary that one be a skilful golfer to take part or to win a prize There are several valuable prizes for the champions, but there are many more for the occasional golfer who is not greatly concerned about his score So send in your entry, bring your clubs and come prepared to enjoy a great day

Annual Meeting

On the occasion of the 131st annual meeting of the Medical Society of the State of New York, a public forum on "Progress in the Art and Science of Medicine Through Photography" will be held on May 26, at 8 P.M. at the Eastman Theatre.

Those who plan to attend this forum may obtain tickets through the convention headquarters, the Chamber of Commerce, upon arrival in Rochester or by mail directly from Dr B. J. Slater, Medical Department, Kodak Park, Rochester.

Opening Address Dr Floyd S. Winslow,
President of the Medical Society of the
State of New York

"*Advant of Anesthesia*" Film—commemorating the discovery of ether by Dr Morton of Boston

"*Modern Anesthesia*" Film

"*Photography of the Eye in Health and Disease*" Commentator Dr Arthur Bedell of Albany, New York, formerly President of the Medical Society of the State of New York

Two piano duet—Leopold Mannes and Irene Gedney

Darkfield Photography—"Bacteria of the Mouth"

Roentgenological motion picture prepared by Dr R. Janker, Chirurgische Institute of the University of Bonn, Bonn, Germany and supported by "Reichsstelle für den Unterrichtsfilm Gemeinnützig G.m.b.H.," showing the head and neck with contained organs

"*The Migration of Blood Cells*" Commentator Dr Warren H. Lewis of Carnegie Institute, Department of Embryology, Baltimore, Maryland.

A new test to determine the degree of efficiency of pasteurization of milk—

prepared by the Health Department Laboratories of the city of Rochester. Commentator Dr Charles Carpenter, Associate Professor of Bacteriology, University of Rochester

"*Pneumonia Typing*" A community protection. Commentator Dr Charles Carpenter

"*The Use of Kodachrome and Infra-red as an Aid to Diagnosis*" Commentator Dr James H. Sterner in charge of the Laboratory for Medical Research Eastman Kodak Company

Violin and Piano Selections—Leopold Mannes and Leo Godowsky

"*Life History of the Mosquito*" Film. Commentator Dr Oliver R. McCoy, Assistant Professor of Parasitology, University of Rochester

"*Roentgenological Views of Normal and Abnormal Conditions of Various Organs and System of the Body*" Film. Commentator Dr James M. Flynn, Vice Speaker of the House of Delegates and Chairman of the Section on Roentgenology

"*Kodachrome motion picture of blood circulation*" Commentator Dr Stafford Warren, Associate Professor of Medicine in charge of the division in Radiology

Entertainment for Ladies

Chairman, Mrs J. Craig Potter

Monday—May 24

2 00 P.M.—Hobby Show (Hotel Seneca)

7 00 P.M.—Dinner at Hotel Seneca for all doctor's wives (Under auspices of Women's Auxiliary)

Tuesday—May 25

10 00 A.M.—Hobby Show (Hotel Seneca)

1 00 P.M.—Luncheon—Oak Hill Country Club

All visiting doctor's wives will be guests

2 30 P.M.—Drive (following lunch) Residential districts, lilac festival, and Parks—the University of Rochester

7 00 P.M.—Dinner of the Medical So-

cety of the State of New York at the Chamber of Commerce

Wednesday—May 26

10 00 A.M.—Sight-Seeing Trip through Eastman Kodak Co

Wednesday Afternoon

President and Mrs Alan Valentine and the ladies of the Medical Faculty of the University of Rochester extend a cordial invitation to the ladies of the Medical Society of the State of New York, and the visiting ladies to a reception to be held at Eastman House 900 East Avenue, from four to six. Guests are asked to present cards which will be obtainable at the Women's Registration Desk, on the Mezzanine Floor of the Hotel Seneca

Hotel Committee

The Annual Meeting of the Medical Society of the State of New York will be held in Rochester, on May 24, 25, 26, and 27. This meeting will be largely attended, and the hotels will be taxed to their capacity. It is therefore important that you make your reservations at once.

Below you will find the names of the hotels listed. The Seneca will be Hotel Headquarters for the meeting.

Please write immediately to the hotel of your choice, as early reservations are important. If you are not successful in securing satisfactory accommodations, kindly communicate with the Rochester Convention and Publicity Bureau, Rochester, N Y, or with the Chairman of the Hotel Committee, Dr Austin G Morris, 277 Alexander St., Rochester, N Y.

Annual Banquet

The Annual Banquet of the Medical Society of the State of New York will be held on Tuesday evening May 25 at seven p m in the large Assembly or Dining Hall of the Chamber of Commerce, in Rochester.

In order to assure yourself and your wife of ideal table reservations, it would be wise to contact Dr E T Wentworth or Dr B J Duffy, addressing your letters to 13 Prince Street, Rochester.

The price of the dinner tickets is five dollars.

Addresses

Greetings from the American Medical Association by Dr Charles Gordon Heyd

"We Look at Ourselves," by Dr Floyd S Winslow, Retiring President, Medical Society of the State of New York

"Shadows in the Mirror of Health," by

Dr T Wingate Todd of Western Reserve University

"The Doctor and Public Opinion," by Mr Carl Ackerman, Dean of the School of Journalism, Columbia University

"Is the Doctor Human?", by Dr Gordon Laing of the University of Chicago

Distinguished Guests

Distinguished guests include Dr Arthur M Johnson, Commissioner of Health, City of Rochester, Dr Albert D Kaiser, President, Academy of Medicine, Rochester, Dr George W Kosmak, Treasurer, Medical Society of the State of New York, Dr Morris Fishbein, Editor, Journal of the American Medical Association, Dr Arthur W Booth, Member, Board of Trustees, American Medical Association, Charles Stanton, Mayor, City of Rochester, Dr George H Whipple, Dean, Medical College, University of Rochester, Marion B Folson, President, Chamber of Commerce, Rochester, Dr Thomas Parran, Surgeon General, U S Public Health Service, Dr Charles H Goodrich, President, Medical Society of the State of New York, Dr James F Rooney, Chairman, Board of

Trustees, Medical Society of the State of New York, Roland B Woodward, Secretary, Chamber of Commerce, Rochester, Dr Leo F Simpson, Chairman, Arrangements Committee, Medical Society of the State of New York, Alan Valentine, President, University of Rochester, Dr Nathan B Van Etten, Speaker, House of Delegates, American Medical Association, Dr Samuel J Kopetzky, Speaker, House of Delegates, Medical Society of the State of New York, Dr Edward G Whipple, President, Medical Society of the County of Monroe, Dr Joseph P Henry, President, Rochester Pathological Society, Carl S Hallauer, Advisory Board, Committee on Arrangements, Frank J Smith, Advisory Board, Committee on Arrangements

COMMITTEE ON LEGISLATION

Bulletin No 14

April 30, 1937

We had hoped that the Legislature would be able to complete its business and adjourn this week, but we were disappointed. Without doubt they will finish next week, either Wednesday or Thursday.

We still have a number of irons in the fire, as you will observe from the statement below. One of the bills in which we are particularly interested now is the Malpractice Bill. The bill that passed the Senate, known as the Esquirol Bill, has received several very valuable amendments in the Assembly. Among these is one including the dentists. This bill should pass the Assembly Monday night, or Tuesday morning at the latest, and we hope to have the Senate concur in the amendments immediately.

Senator Feld advises us that very powerful opposition has appeared to the Kleinfeld Radiology Bill, which he says will prevent him from reporting it out of his committee.

Senator Feld amended the Advertising Bill another time by reintroducing an unprofessional conduct clause. This kills the bill so far as its passage this year is concerned.

We are about persuaded that it will be impossible to amend the Lien Bill satisfactorily this year. One ray of hope has come out of the discussion on this bill, and that is some of the opposing attorneys are thinking that they might have less difficulty in securing the cooperation of physicians in settling negligence cases if they are interested in a lien on the award rather than fees to be paid by the attorney.

Action on Bills

S Int 737—Livingston—Public Welfare Law, home relief administration—Passed Sen, 3rd rdg As

S Int 838—Esquirol—Physicians' malpractice, public institutions (A Print 3081)—3rd rdg As

TO WIN THE NEXT WAR WITH SODA MINTS

A dispatch from Berlin says that a simple method of increasing physical capacity and endurance between thirty and one hundred per cent was outlined before the Berlin Medical Society by Professor Helmut Dennig, noted director of the fourth medical university clinic of Robert Koch Hospital in Berlin.

The method, which has been tested in numerous laboratory experiments as well as in the German sport field, consists of increasing the body's alkali content, thus enabling it the more easily to rid itself of acids, especially lactic acid, which is one of the principal causes of exhaustion.

The additional alkali content, said Professor Dennig, can be supplied in such a form as bicarbonate of soda, related preparations and special foods, such as soya bean flour.

This method, he insisted, is wholly dif-

ferent from doping by drugs because it does not increase but rather reduces the bodily effort which is required for certain tasks.

To be effective, he explained, alkalization must be produced suddenly and must not last longer than two to four days. Experiments have shown that a runner thus prepared was able to run at full tilt for forty-two minutes instead of twenty, as formerly, and that a bicycle racer was able to maintain a sprint for 159 minutes instead of 109.

However, said Professor Dennig, sport was not the primary consideration of these experiments but rather the employment of this method "on other occasions." Inasmuch as German science is coordinated with military economy, this method may well be used to increase the German soldier's efficiency and endurance in attack.

Presidential Address

The Doctor and the Public

FLOYD S. WINSLOW, M.D., Rochester

President, Medical Society of the State of New York

I believe I am indebted to you, Dr Livingston Farrand, for the theme of what I wish to say tonight. At the moment I cannot repeat the precise words in which you made the statement to which I refer—perhaps you will let us have it later—but the meaning of what you said was that one of the chief problems of our people is to learn to recognize their *real* experts.

We will all admit that the physician is a real expert. Most people who are sick consult him, but many go to charlatans, many prescribe for themselves or consult the clerk at the sandwich bar in the drug store. And in matters affecting the public health the doctor is not always accepted without reservation as a real expert. I wish to inquire why this is true, and to discuss for a few moments the philosophy of the doctor's relations, as a group, with the public, so-called, as a group.

We have witnessed a striking revolution in the thinking of civilized mankind in the last generation. It is far more potent in its influence on our lives and the future of humanity than any single war, for this revolution bears within itself the seeds of many wars, as well as the seeds of everlasting peace. I mean that the use to which modern scientific advances have been put in increasing the facility for the exchange of communication by radio, by telegraph, by airplane, by newspaper, magazine, and pamphlet, has so magnified the ability to consolidate public opinion, that the real expert of tomorrow—nay, of today—is only the man who can persuade the public that he is an expert. Grant that the public too often has insufficient means of knowledge, grant that the arts of persuasion in the hands of the wrong persons may become the blandishments of sophistry, my point is that the time has come when no cause can prevail,

no expert be recognized, no benefits conferred on society by philanthropy without the coincident use of the tools of deliberate popular persuasion. The expert, be he doctor, lawyer, or philanthropist, who ignores this fact, is doomed.

Governments all over the world today address each other in terms of what will appeal to the public, rather than what will appeal to the officials of the governments addressed. Commenting on this fact, let me quote Professor DeWitt Clinton Poole, director of the School of Public and International Affairs, Princeton University:

Until a short time ago a diplomatic note was addressed in spirit by one group of bureaucrats to another. The language was restrained and often technical. A phrase that would seem to the ordinary reader merely solemn might convey to the initiated the threat of war. Though traditions of that kind are apt to be tenacious, those diplomatic documents of the post-war era which deal with major issues of policy and therefore touch the people, have taken on quite a different character and tone. I ask you to refer to the notes published by the French and German Governments after Germany had occupied the demilitarized zone of the Rhineland. Though nominally directed to official quarters, these communications were hardly more or less than stump speeches aimed at the broad masses of the people in sending and receiving countries and everywhere else. The manifest purpose of both the French and German declamations, like other diplomatic notes to which we have grown accustomed recently, was not by intellectual presentation to convince a foreign office or a ruler, but rather to arouse public opinion at home and abroad and align that opinion on the side of the government publishing the note.

It is significant in this connection that Professor Poole has recently launched a quarterly publication called "Public Opinion." It is devoted to the study of influencing public opinion, both objectively as to the forces which are functioning, and more

Address delivered at the annual dinner of the Cornell University Medical College Alumni Association, at the Biltmore Hotel, New York City, April 29, 1937

subjectively as to the methods and technics of those who are specially engaged in propaganda, using that term in its better sense, the dissemination of ideas for the purpose of convincing or persuading large numbers of people

What is organized medicine to do in the face of this new force which is, by virtue of the revolution I have named, coming into control of society? Ortega y Gasset in his "Revolt of the Masses" has fully described this great revolution, and pointed out that the masses in liberal democratic countries have possessed themselves of the political power to move directly toward their desired ends, often mistakenly under ignorant, misguided or unwise leadership, but frequently in the promotion of beneficial measures. What is medicine to do? Remain, as we have too often been, the experts who should be, but who are not always, consulted? Or shall we, with dignity and decorum, and in keeping with our ideals and aspirations, take upon ourselves the obligation of explaining fully to the public what we stand for, why we stand for it, in terms that can be understood by a taxicab driver?

An illustration or two, and I leave the question with you. In medical society meetings time and again I have heard resolutions passed against this or that, condemning proposals as "inimical to the interests of organized medicine," or criticizing "lay control" of medical concerns, or stating that the doctor is the "best judge" of how medical care should be distributed without, at the same time, presenting any reasons for these dictums. Now the doctor may rightfully be the best judge, and yet be without a court to sit in. The public may not like his assumption of authority and decline to elect him. There are other people claiming to be judges, too, and we cannot dismiss them summarily, unless we are able to present better reasons for being right than they have. We should offer these reasons in such a way that from them it is obvious that we are right. When we say that compulsory health insurance will provide for "lay control" of medical practice we don't get very far with the man who thinks perhaps the doctor's motive is resentment against somebody else being as it were "in on the gravy" who isn't a member of the guild. Now what we really

mean is that it is not to the interest of *the public* that men not trained as physicians should come between the doctor and his patient. Then why don't we say so? It is not at all convincing to say of a proposal that it is "inimical to the best interests of organized medicine." On close scrutiny it will generally be found that the proposal is also inimical to the best interest of the public, and because of this it becomes inimical to the best interest of the doctor. Why don't we say so? And why don't we give the reasons, not rest content with official pronouncements and edicts?

I am reminded at this point of a story they told years ago at Cornell of the young lawyer arguing a case to the court who was interrupted by the judge saying, "Young man! That is not the law." "No," replied the young lawyer, "but it was before your honor spoke." That story may not be a good one to tell at all in a very few years. Our brothers of the bar, too, are feeling the force of public opinion. It is seriously questioned whether they are really experts. They are challenged to prove it. The crowd, dynamically vocal in the world today, does not understand and questions all previously accepted institutions. "How?" and "Why?"

May I cite a timely example in a matter now before our national legislature? In the government reorganization which is planned, there is provision for the consolidation of departments. Organized medicine believes, and has stated, that all health activities should be in one department divorced from social or welfare matters, and in charge of a physician as its chief executive officer. But it is not enough merely to enunciate this. Immediately the thought will occur to those in Congress who will have the decision, as well as to those in the administration, to say nothing of the general public, that they would like to know the reasons behind our position. Just *why* should these activities be consolidated just *why* should they be administered by a physician?

Permit me to submit a few reasons, not only as now pertinent for the consideration of those who have these decisions to make but also as an illustration of my present theme.

A department to combine health and welfare inevitably offers a multiplicity of

complex problems in diverse fields, in which it is impossible for one administrative chief, or for any subordinates, to have had such training and experience as to be useful in both the medical or health and social service aspects of the work. Such a department would, if so constituted, make it probable that its chief would be a non-medical person. It is likely that a doctor would hesitate to administer matters of a social work character, in which he might not consider himself especially qualified. But a lay person with social work training might consider himself capable of taking charge of the health and medical affairs of the nation, despite his lack of training and experience in medicine and in public health.

Why is education, training, and experience in medicine and public health essential for the chief administrator of such a service? The reasons are not difficult to explain. Any administrator, lay or medical, will wish to avoid unnecessary expenditures of funds. It is part of his duty to guard jealously against proposals which are of doubtful merit, to disburse his budget carefully to obtain the greatest possible benefit. What is useful and what is not useful, what is wise and what is not wise, what will work and what will not work in medical and health matters, is not by any means so apparent to a man without medical education as it is to a doctor. Time is lost in presenting to the administrator evidence which does not need to be offered to a man whose experience has taught him to *know* these subjects already. In cases of the highest practical importance it has been frequently the case that a non-medical administrator makes decisions against competent advice because incompetent advice sounds more plausible to him. Not only are public funds dissipated, but obstacles and delays to real headway are interposed by pursuing a policy of doing the job while learning how to do it, a process of trial and error.

Governments select experienced architects to design buildings, experienced builders to build them. In public posts where doubtful questions of income tax are presented, a bookkeeper will not take the place of an accountant. In concerns more important still, such as the health of the people, an executive who is untrained medically might come to the task with

the best intentions, but it would be inevitably many years before he acquired a smattering of the rudiments of disease prevention and control. This should be a basic part of his original equipment. He is unqualified without it. If conscientious, he would in effect be attending a part-time medical school at the expense of the public. He would learn through costly mistakes.

There is no lack of available qualified candidates. Several physicians, adequately trained in medicine, with years of successful public health experience to their credit, could be named, any one of whom might head up a department in which all public health activities of the federal government were merged. There is no need to take a chance with a man incompletely equipped. Tried and proved personnel is nowhere more important than in the sick room, the hospital, the laboratory and the public health service. Men who are to work together in a common enterprise as the private physician and the public health administrator must do, need to speak a common language which will take for granted many details which cannot be part of the equipment of a non-medical man. The doctor in the health service and the doctor in private practice possess in common a large body of accumulated knowledge which has been made available through education, training and experience. Public health work, at its best, essentially requires cooperation between the public health authorities and the private practitioner. The physician's interest and skill will be best elicited if both he and the health officer fully understand the alphabet by means of which they communicate.

These reasons may not be the best ones. They may not be convincingly presented. Other considerations may intervene to prevent their acceptance by Congress. I am offering them as an illustration of my point, which needs the comparison of this method of presentation with the one which groups of doctors usually use in expressing themselves. I shall read you now a resolution on this subject passed by the executive committee of the Medical Society of the State of New York, and will ask you to compare it in its capacity to persuade, with the presentation which has just been made.

Resolved that the Medical Society of the State of New York urge that the

reorganization of the federal government combine in one department all medical and health activities making this a separate and distinct department, and urge especially the nomination as chief executive officer of such department of a qualified physician with a record of achievement in administration

This resolution is not offered in criticism of the executive committee of the Medical Society of the State of New York of which I am president. There is no other way than this for an institution to speak. I am offering it to show that something additional is needed which cannot be supplied by the anonymity of committee action, but requires individuals to speak as human beings, one to another

I am not recommending that medicine address itself to the public in this way on subjects other than those which may prop-

erly be described as quasi-medical, rather than as medical. I am opposed to spokespersonship for medical societies being vested in any other persons than officers or executives of the organization responsible to the membership. We must protect the public from the use of this tool by the unscrupulous charlatan who might connive with the journalist to advance his personal interests under the guise of interpreting organized medicine

This concludes my presentation of the matter, except to add that it is apparent we must have spokesmen who can and will study the forces which are operating in society to form public opinion, who have courage to take the risk of temporary misunderstanding and criticism of some of their fellow doctors, and they must address themselves deliberately to the use of these new forces in civilization if these influences are to operate to the benefit of the *public* and the doctor

Physicians of the State of New York Do It Now!

If you're under forty years of age, you owe it to your family to carry ONE THOUSAND DOLLARS in LIFE INSURANCE with the New York Physicians' Mutual Aid Association

During the past sixty-nine years, the Trustees served the members of the association gratuitously, administering \$1,775,000 in death claims, which were promptly paid to the beneficiaries

Through the Benevolent Fund many physicians who were in financial distress were helped with substantial loans without embarrassment or interest charge. The dues are fair, just enough to meet obligations and pay expenses

By becoming a member you will help to carry on this benevolent service for the colleagues of today and for those who will follow

Application blanks may be obtained by addressing the office. If you desire it, a personal visit by our representative can be arranged

Our sincere thanks to the Medical Society of the State of New York for this space

New York Physicians' Mutual Aid Ass'n,
2 East 103 Street, New York City

Public Health News

The General Practitioner and Tuberculosis

The author of the paper on which this abstract is based is a tuberculosis specialist whose earlier professional years were spent in a somewhat arduous general practice, and who is as a result of this experience unusually appreciative of the difficulties under which the general practitioner labors, particularly in the handling of his tuberculous patients

In any tuberculosis control program the general practitioner is the connecting link between the patient and the tuberculosis specialist. Each of the three has certain responsibilities regarding the early diagnosis of tuberculosis and each, therefore, must bear some of the blame for cases diagnosed late,—the patient in that he has disregarded his symptoms, the practitioner in that he did not “tumble to it earlier,” the tuberculosis specialist for failing to x-ray suspected cases. How may this chain be strengthened?

Considering first the link between the patient and his doctor, it is patently impossible to set the machinery in motion unless the patient comes to his doctor. Can anything be done to reduce the quite considerable percentage of patients who ignore their symptoms? The answer is, of course, a more adequate health education program so that “the public can be better informed about the onset of tuberculosis and the importance of early diagnosis.” And the responsibility rests on tuberculosis associations and health departments.

In other cases, however, the delay in diagnosis is chargeable not to the patient but to the physician.

Here medical education must bear a large part of the blame. All too often the cases of tuberculosis seen by the medical student show all the classical signs and are, therefore, in an advanced stage. It is difficult too for the student to appreciate the slowness of the clinical course of tuberculosis. Most illnesses can be watched by the interne from immediately after onset until their termination. In tuberculosis he has “brief glimpses of different individuals at different stages and with different reactions” and “he is a genius if he can piece together the story from these odd chapters torn from different books.” In this instance the challenge is to the medical schools.

Yet whatever the shortcomings of his undergraduate training in the diagnosis and treatment of tuberculosis the physician who

engages in general practice will encounter many cases of tuberculosis and must therefore keep it ever in mind and use every opportunity for improving his ability to diagnose it. The author would impress upon the minds of all newly qualified doctors the following two thoughts.

“Always be on the lookout for TB even though you run the risk of being thought a crank for your pains. Never label an illness ‘influenza’ if there is no epidemic without subsequently having the chest x-rayed to make sure.”

The general practitioner will frequently encounter a case which he has reason to believe is tuberculosis but on which he needs expert advice or additional diagnostic facilities, and it should be possible for him to secure x-ray plates of his patient's chest and where necessary the services of a tuberculosis specialist.

He is also much more likely to maintain his zeal for early diagnosis if he knows that adequate provision is made for the treatment of his patient in the event that his suspicions prove to have been well founded. In the event that no facilities exist for the hospitalization of the tuberculous he is likely to take the attitude that early diagnosis is of purely academic interest. To quote the author's analogy,—“supposing that neighboring surgeons would not operate on acute abdomens, one's zest for differentiating between perforated gastric ulcers and colic would be blunted, and one would fall too readily into the easy way of medicine which is—expectant treatment and guarded prognosis.”

The general practitioner occupies a position of great strategic importance in the control of tuberculosis. He brings the patient into the world. On him in most cases devolves the responsibility for the initial diagnosis of tuberculosis and “after the tumult and the shouting have ceased, the tuberculosis officer and the sanatorium physicians departed, he tends the patient for the rest of his life and eases his parting.”

The patient returns to him from the

sanatorium a changed man both physically and psychologically. Various things have happened. "First, he has come to accept the fact that he has tuberculosis and that it is a long complaint. Secondly, he has lived among other patients who are in the same plight. Thirdly, he has learned a lot about his complaint."

The general practitioner is now "the man on the spot." Yet much can be done to make his task easier and here are some of the ways in which the link between the general practitioner and the specialist (sanatorium physicians) may be strengthened.

"I consider it a blasphemous act for anybody to undermine whatever faith a patient may have in his doctor. For the patient, it is better to have faith in a mediocre doctor than a distrust of the best. For the average mediocre doctor it is far greater incentive to do good work and make himself worthy of the patient's unswerving (and often pathetic) belief in him. This is a matter in which tuberculosis officers, consultants and sanatorium physicians have the greatest power and where their closest cooperation is needed."

Secondly, a commission should be appointed to decide on post-sanatorium advice and treatment. The points which they consider of value should be embodied in a small printed pamphlet of instructions capable of alternate readings dependent on the mere stroke of a pen. It should be a simple matter to draw up such a set of instructions. If one copy be given to the patient on discharge, another to his doctor and another to the tuberculosis officer everybody would know where they were. In addition "I

should like to see the doctor receive a copy of the x-ray photographs as well as the usual statistics such as body weight, blood sedimentation, rales, etc., which he can continue to record should he feel so inclined." Could a general practitioner read chest X-ray plates? Speaking for his late self of general practice days, the author's answer is—"No, he couldn't, but he would if he were given a chance."

Lastly, let the tuberculosis officer meet the doctor periodically for a real consultation over their shared cases. Once every three months say, there could be set aside a tuberculosis afternoon when the tuberculosis officer would meet the general practitioner and their ambulant patients at the doctor's consulting room after which they would proceed together to the home-bound cases.

Such close cooperation would have in the author's opinion a most stimulating effect.

With it," he writes, "the alleged ignorance and carelessness of general practitioners could not exist. It is the sort of help I wanted and could not get. It is not an impossible demand for I know that in some localities it is in existence and works well. Could it not be made a universal practice?"

The campaign against tuberculosis requires a chain of cooperation the links of which should be equally strong. These links are those between the patient and the general practitioner and between the general practitioner and the tuberculosis specialist. Their respective responsibilities have been discussed by an author who has had extensive experience in both of the medical roles. His suggestions merit serious consideration.

Tuberculosis in Dollars and Cents

Penny-wise and fence-straddling policies of public authorities in attacking tuberculosis are resulting in needless waste of millions of dollars in terms of unnecessary deaths, preventable illness and disrupted homes. The Early Diagnosis Campaign, conducted nationally throughout the month of April by the National Tuberculosis Association and, in this State, by the Tuberculosis and Public Health Committee of the State Charities Aid Association and local committees, is intended primarily to bring acutely to the attention of the people the need for positive action in making further inroads against this disease.

Every thirty-four minutes a new case of

tuberculosis is reported in New York State but only once every 170 minutes is a case reported which holds real promise of recovery. In other words, the disease has progressed to the advanced stages in more than four out of five cases before proper medical care and supervision are provided. Every one and one-quarter hours, a person dies from this disease.

For more than thirty years, tuberculosis has been defined as a humane problem and as a public health problem. It is also an economic problem and must be faced as such.

The cost of tuberculosis to the family and to society can not be measured only in terms of the individual illness or demise. Tuberculosis leaves in its wake the seeds for other cases. By intimate contact in the home, in industry and otherwise, these seeds may

be cultivated sufficiently to cause destructive disease. It is estimated that each case costs society, directly or indirectly, at least \$5,000. At present there are in New York State approximately 45,000 persons suffering from tuberculosis—a liability in dollars and cents of more than \$225,000,000. These cold figures do not take into account the undermining influence of the disease on the home as the basic unit of society. The resultant individual and family handicaps can not in fairness be measured in dollars and cents. No statistician or economist has yet been able to determine fully the intangible losses imposed by pain and suffering.

Many people have been led into a sense of false security by the publicity accompanying the declining death rate from tuberculosis. Too frequently it is said that tuberculosis is no longer a serious problem. Despite the encouraging advances made, tuberculosis is still public health Enemy Number One in the most productive years of life. More vigorous methods of case-finding and diagnosis must be carried on among women between the ages of fifteen and thirty. It is in this age period that women make their greatest contribution in the establishment of homes and the rearing of families. Likewise, this merciless reaper of human lives takes its greatest toll among men between the ages of twenty-five and forty-five when they mean most to their dependents and to the industrial life of the country.

Why do we tolerate tuberculosis? Because too many people are still living in the horse and buggy days and have not seen fit to retire the horse to pasture and the buggy to a museum and use modern weapons in the control of the disease. The X-ray is one of the most important of those weapons.

Unfortunately, either because of indifference or ignorance, a sufficiently large proportion of the people do not utilize completely the available instruments of prevention and control. New York State may well be proud of the development of its anti-tuberculosis service. The distribution of chest clinics, dispensaries and tuberculosis hospitals is such that some facilities are available in every section of the State for early diagnosis and treatment. Particularly in those localities where the State Department of Health is providing these services, practicing physicians have participated unselfishly in the program. In the large cities, medical practitioners cooperate in direct proportion to the scientific leadership available at clinics or hospitals.

The discovery of early tuberculosis means early recovery in the vast majority of cases. Delay in diagnosis means long periods of treatment and, altogether too frequently, a fatal outcome. Of the chronic diseases, tuberculosis is one of the most amenable to treatment. The use of modern weapons both in diagnosis and treatment enhances the opportunity for a greater number of cures.

In upstate New York, the investment in tuberculosis hospitals represents a sum of more than \$25,000,000. The annual cost of administering these hospitals is \$6,000,000. At least a similar amount is spent in New York City. From comparison of this annual expenditure of about \$15,000,000 for tuberculosis hospital service with the sum of \$225,000,000 represented by 45,000 cases in this State, it is apparent first, that the tuberculosis problem is far from solved, second, that more hospital facilities should be provided, and, third, that more prompt and complete utilization of available facilities is urgently needed.

Beware of Water Hemlock—Borgia of Wild Plants

Water hemlock, one of the most poisonous of wild plants in the United States, probably has destroyed more human lives than all of our other toxic flowering plants combined. In springtime when children are ready to eat any succulent green that tempts them in their rambles over the countryside, the water hemlock (*Cicuta maculata* L.) is not only most alluring, but it is generally believed, most deadly.

Resembling closely its esteemed brethren, the carrot and parsnip, this black sheep of the parsley family lurks in swampy land throughout the eastern part of the country and is found to some extent as far west as the Rocky Mountains. Multi-branched and

tall, with lacy white flowers and dissected leaves, the whole plant is permeated with a fragrant oil that is most abundant in the spindle-shaped roots clustered at the base of the stem. It is these roots which are chiefly responsible for poisoning of human beings. The symptoms of hemlock poisoning are many, including violent contraction of muscles, dilated pupils, vomiting and diarrhea. Cases of suspected poisoning, from whatever source, should always be placed in the hands of a skilled physician. Never is medical care more urgently needed than when the *cicuta* is the cause of the illness.

Water hemlock travels under a number

of aliases, the most common being "cowbane," "snakeroot," "spotted hemlock," "spotted parsley," "snakeweed," "beaver poison," "musquash root" and "muskrat weed." It has a retinue of lawless wild plant followers that should be shunned by everyone, particularly children.

There is the poison hemlock (*Conium maculatum*) which may be distinguished

Courtesy State Museum

Water Hemlock

from the water hemlock by its very large, much compounded leaves and the fact that it prefers fairly dry ground in the neighborhood of towns while *cicuta* grows in wet places.

Many fatal cases of poisoning have been traced to the wild parsnip (*Pastinaca sativa* L.), a tall coarse-leaved plant of the same species as that under cultivation, which grows wild in waste places quite generally.

The potato family has several outlaw members, notably the thorn apples (*Datura stramonium* L. and *Datura tatula* L.) both stout, large-leaved, ill-smelling plants, producing enormous trumpet-like flowers and fruits bearing many dark seeds. The victims of the thorn apples are usually children who are poisoned by eating the pleasant-tasting seeds in the green capsules or by chewing the great blossoms.

Equally dangerous are the enticing black nightshade with its clusters of white flowers followed by black, round berries, and its close relative, the bitter sweet, a climbing plant with large clusters of red berries. The latter should not be confused with the woody bine, often called "bittersweet," with attractive orange-red fruit, commonly used as a winter decoration. The fruits of the buckthorn, poke, baneberry, English ivy and daphne are also to be avoided.

From this imposing but only partial array of man's plant enemies, it is plain that everyone should refrain from eating wild plants, no matter how pleasing to the eye, unless they are known to be harmless. Education of school children and others with respect to the identification of these plants and their poisonous properties is of the greatest importance. Finally, in cases of poisoning, a skilled physician should be called at once. The delay of an hour may mean death.—*Health News*, April 19, 1937

Lipoid Pneumonia

In recent years, largely as the result of commercial advertising, there has been an enormous increase in the use of various oily preparations for application to the nasal passages.

In infants such applications are not free from danger, for experience has shown that the oil may be drawn into the lung and give rise to a fatal pneumonia. For this reason most pediatric services now prohibit the use of oily substances in the nose of infants under two years of age.

Fatal cases of pneumonia caused by the aspiration of oily preparations into the lungs have been reported in American medical

literature since 1925. The number of cases of this form of pneumonia is undoubtedly far greater than the number of fatal cases reported in the literature. The condition is usually observed in children under two years of age, and especially in artificially-fed, poorly nourished infants, and in those with any difficulty in swallowing or breathing. Often there is a history of a nasal discharge, coughing spells, or asthmatic attacks, and a history of frequent instillations of oil into the nostrils.

The patients show the clinical signs and symptoms of a low grade pneumonia and examination with the x-ray usually shows

a shadow along the sternal border of the pulmonary fields. At autopsy the lungs show the reaction of the tissues to a foreign body and the results of a secondary invasion by bacteria. Large amounts of oil are often present in the lung.

Infants may recover from such an attack and general health may improve under proper management although a residual pneumonic process may persist indefinitely. Death usually results from a secondary pulmonary infection. The condition is now generally spoken of as "lipoid pneumonia."

With the increasing attention which physicians have given to lipoid pneumonia in recent years, it has been found that oily nasal drops are not the only agents which may cause this form of pneumonia in infants. Cod-liver oil and even cream have been involved in some of the cases reported. These cause a different reaction, usually an acute pneumonia. In other words the condition can also be brought about by oily substances given by mouth. Hence great care is necessary especially in the case of sick and debilitated infants and in those suffering from neurological conditions such as those caused by birth injuries. Mothers should be warned not to give cod-liver oil to a struggling rebellious infant, or to very feeble ones, for there is great danger of aspirating some of the oil into the lung.

Following are some excerpts from authoritative sources:

Dr Douglas Symmers—General Director of Laboratories, Bellevue Hospital—"The evidence is sufficiently strong to say that the indiscriminate introduction of oily substances into the nose should be stopped. It is a definite health problem."

Dr Paul Klemperer—Pathologist, Mt Sinai Hospital—"The condition is now being found with increasing frequency at autopsy. Occurs in adults as well as children. The condition constitutes a public health menace."

Dr Rustin McIntosh—Professor of Pediatrics, College of Physicians and Surgeons, Columbia University and Attending Pediatrician, Babies Hospital—"There is enough evidence to warrant an educational campaign against the use of oil in noses of infants up to two years of age. The use of nasal oil drops for this age group has been virtually abandoned in hospital and dispensary practice at the Columbia-Presbyterian Medical Center."

Dr Charles Hendee Smith—Professor of Pediatrics, University and Bellevue Medical College and Attending Pediatrician, Bellevue Hospital—"Nose drops should not

be used in feeble, marantic, sick or young infants, certainly not before the age of three months. Large amounts of oil should never be used. The same precautions should be taken in the administration of oil preparations by mouth. All nasal instillations should be given with the head in the inverted position."

Dr Bela Schick—Director of Pediatrics, Mt Sinai Hospital—"The condition is sufficiently frequent to prohibit the use of oils in the noses of infants."

Dr Sam Z. Levine—Professor of Pediatrics, Cornell University Medical College, and Pediatrician-in-Chief, New York Hospital—"The use of oil nose drops should not be permitted in debilitated or sick infants, or in infants suffering from neurological conditions such as birth injuries. I do not believe, however, that a general prohibition should be placed against the use of oil nose drops. Care should also be taken in the administration of oil preparations by mouth."

Dr Herman Schwarz—Director of Pediatrics, Beth Israel Hospital—"The use of oil drops in the noses of infants should be banned."

Dr Jerome Leopold—Attending Pediatrician, Lenox Hill Hospital—"Lipoid pneumonia has occurred frequently enough to prohibit the use of oil in the nose of infants up to one and one-half years of age."

Dr Charles A. Weymuller—Professor of Pediatrics, Long Island College of Medicine—"I feel very definitely that your campaign to point out the harmful effects of oily nose drops is a very praiseworthy one. We have seen a great many more lung disturbances due to oily irritations than ever before."

Dr Max Lederer—Director of Laboratories, Jewish Hospital of Brooklyn—"Oil medications should not be used in either infant, children or adults, unless there is an assurance that they will not enter the respiratory passages, and that the palatal reflex is intact. In the six cases that we have studied and reported in the literature, all were traceable to oil medication by way of the nose or mouth in individuals who were unable to swallow properly."

This bulletin was prepared for the information of the medical and nursing personnel of the Department of Health, City of New York, by direction of the Board of Health (April 1937)

CHARLES F. BOLDUAN, M.D.
Director, Bureau of Health Education

Diphtheria in New York City

Warning that a rise in incidence of diphtheria in New York City had occurred was sent out to all the physicians of that city by its Commissioner of Health, Dr John L. Rice on March 19. At that time he said:

The unusual prevalence of diphtheria at this time calls for concerted action on the part of all concerned so that all young children may be effectively immunized against this disease. For the first ten weeks of this year we have had 389 cases as against 338 in the corresponding

period of 1936. There have also been more deaths so far this year than in the first ten weeks of last year. Everything indicates that the disease will become more prevalent than in the last six years unless we have more immunizations.

In the period that has followed since that letter was received by the physicians in New York City, experience has proven that this prophecy was fully justified and that the advice given was timely.

Recommended Procedure for Diphtheria Immunization

Evidence is accumulating that immunization of children under nine months of age is less effective and probably less permanent than at nine months, further, that the one injection of alum toxoid does not confer as high a degree of immunity as two injections of plain toxoid.

In the immunization made in the various stations of the Department of Health the use of alum toxoid has been discontinued. We now advocate immunization of children at nine months of age and the administration of two doses of plain toxoid.

Dosage

For children under three years of age, two injections of toxoid (1 c.c. each) should be given at an interval of two weeks. Where a reaction results after the first injection, the second should be diminished in accordance with the degree of reaction ($\frac{1}{4}$ to $\frac{1}{2}$ c.c.).

For children between three and six years of age, two injections should be given at

an interval of two weeks, the first dose being $\frac{1}{2}$ c.c. and the second 1 c.c., if there is no reaction. If there is a reaction, the second dose should be the same as the first ($\frac{1}{2}$ c.c.). If this causes no reaction, a third injection (1 c.c.) may be administered. If the second injection of $\frac{1}{2}$ c.c. still causes a reaction, the dose for the third injection should be the same as the second injection ($\frac{1}{2}$ c.c.).

For individuals of six years and over, two injections should be given at the same interval (two weeks), the first dose being $\frac{1}{4}$ c.c. and the second dose 1 c.c., if there is no reaction. In case of a reaction, the second dose should be the same as the first ($\frac{1}{4}$ c.c.). If this causes no reaction, a third injection (1 c.c.) may be given. If the second injection of $\frac{1}{4}$ c.c. still causes a reaction, the dose for the third injection should be the same as the second ($\frac{1}{4}$ c.c.). In other cases, the dose should be somewhere between these two limits ($\frac{1}{4}$ and 1 c.c., depending upon the amount of reaction).

FOUR CENTS A DAY

If a doctor reads a New York paper and a local newspaper daily and a New York paper on Sundays,—these unusual luxuries cost him \$23.98 per year.

If a doctor smokes two ten cent cigars daily, his annual outlay for this little amenity is \$73.00. If instead, he consumes five packs of cigarettes a week, he will have paid out in twelve months \$39.00 for the little coffin nails, of which about \$16.00 goes to the federal government.

If he owns a 4,000 lb. car his registration costs him \$20, his liability insurance about \$60, his garage space at least another \$60, and fire, theft and collision insurance \$20 more,—an outlay of \$160 or more—

to say nothing of depreciation, whether he drives his car twenty-five miles or 25,000!

If perchance, five times a week he indulges himself with a snack of camembert and crackers before retiring the annual cost of such revelry may reach \$35.00.

Unless the doctor is totally bald, he probably spends more at the barber shop than for the support of his County Medical Society.

His County Medical Society dues cost him \$15.00 a year, \$0.04 (four cents) a day!

Medical News

Bronx County

THE BRONX COUNTY MEDICAL Society, at its meeting on April 21 listened to the following pathologic program a Arteriosclerotic Heart Disease, Louis R. Ferraro, M D , b Syphilitic Heart Disease, William Aronson, M D , c Rheumatic Heart Disease, Joseph Ehrlich, M D

Broome County

THE ANNUAL CLINICAL DAY program at Binghamton City Hospital was held on April 14 with medical men of southern and central New York arriving for operating room demonstrations and clinical conferences

General theme of the program was "Treatment of Diabetes" Principal speaker was Dr Elliott P Joslin, clinical professor of medicine at Harvard University Medical School and a leading authority on diabetes

Operating room clinics and medical discussions were conducted by Binghamton physicians during the day The program included ward inspections and x-ray demonstrations

The program was in charge of Jerome F Peck, superintendent, and a committee of physicians

The Broome County Medical Society held its monthly meeting at Phelps Hall in the evening in conjunction with the annual Hospital Clinic Day of the Binghamton City Hospital Dr Joslin, spoke on "The Treatment of Diabetes and Especially the Use of Protamine Insulin"

Chautauqua County

THE REGULAR SPRING MEETING of the Chautauqua County Medical Society was held on April 21, at Mayville

The meeting was preceded by a dinner, followed by a business meeting and scientific session Dr Samuel Sanes and Dr Frank Meyers of Buffalo, discussed the clinical and pathological aspects of jaundice.

Chemung County

AT THE MEETING OF the Chemung County Medical Society on March 31, at the Arnot Ogden Memorial Hospital, it was voted that the Society adopt the Metropolitan fee

schedule of the compensation commissioner as a minimum fee schedule for the members of the Society, take effect May 1 A committee was also appointed to revise the Society's fee schedule It was voted that in the hospital insurance plan proposed by local hospitals that anesthesia be included in the hospital insurance contract, that the practising surgeon be allowed to choose his own anesthetist and in case the anesthesia is given by a physician, he be compensated by the hospital, that the x-ray department of the hospitals be credited with the regular fee for x-rays done on people insured by the hospital insurance plan and that these fees be paid from the hospital insurance fund—Reported by Dr F S Hassett, Secretary

Chenango County

PNEUMONIA AND ITS VARIOUS phases was discussed at the quarterly dinner meeting of the Chenango County Medical Society in Norwich on April 1

Dr W H Mason, president of the Society, introduced three speakers, all connected with the Syracuse College of Medicine, Dr E D Chapman, Dr O W Mitchell, professor of public health, and Dr Chas D Post, professor of medicine

President Roosevelt's supreme court plan was condemned by the society in the adoption of a resolution by a unanimous vote

Columbia County

AN AUXILIARY TO THE Columbia County Medical Society was formed on March 31 at a meeting in Hudson, with an enrollment of forty members Mrs Henry Galster of Hudson was elected president After the meeting the Medical Society was host to the Auxiliary at a tea The Auxiliary held a luncheon-meeting at the Columbia Country Club on Tuesday, April 20 Plans for the coming year were discussed and a constitution and by-laws presented for the approval of the members

Erie County

DR. CHARLES GORDON HEYD, president of the American Medical Association and a graduate of the University of Buffalo, was a speaker at the 62d annual clinical day of the University's Medical Alumni Associa-

tion on April 17 Dr Hugh Cabot, of the Mayo Clinic, read a paper on "Pyelo-Nephritis"

DR. WILLIS G GREGORY, Professor of Pharmacy at the University of Buffalo School of Pharmacy since 1886 and Dean of the School from 1890 to 1936, died of cerebral hemorrhage at his home in Buffalo, March 20

Franklin County

DR E M JAMESON was elected president of the Saranac Lake Medical Society at the annual meeting on March 31 Dr Jameson succeeds Dr John R Steidl Other officers named were Dr Eric Richardson, vice-president and Dr Warriner Woodruff, secretary and treasurer

Herkimer County

THE HERKIMER COUNTY Medical Society met at the Mayfair Inn, Middleville-Herkimer highway, on April 13

An address on the "Group Hospital Plan," was given by H C Stephenson Four reels of motion pictures dealing with "Traumatic Surgery of the Extremities" were shown.

THE HERKIMER VILLAGE BOARD on April 13 decided to permit restricted parking spaces for all doctors in front of their offices, as in a number of other towns and cities

Kings County

THE MEDICAL SOCIETY of the County of Kings, at its meeting on April 20, had, as its scientific subject, "Intrathoracic Suppuration" (a) Discussed from the Medical Standpoint Edward N Packard, M.D, (b) Discussed from the Surgical Standpoint Pol N Coryllos, M.D, F.A.C.S

THE MEDICAL SOCIETY of Bay Ridge celebrated its "coming of age" with its 21st annual dinner dance on April 7 in the Hoster Bossert. About 200 attended.

THE ITALIAN MEDICAL SOCIETY of Brooklyn held its annual dinner and dance for the benefit of sick and indigent members on April 1 in the Hotel St. George

Madison County

MEMBERS OF THE AUXILIARY of the Madison County Medical Society gathered at Hotel Oneida on April 8 for the monthly dinner meeting, Mrs Robert L Crockett, presiding The group, which recently voted to sponsor the Cancer Drive, now being

organized in Madison County and Oneida, heard an interesting discussion of "Women Doctors" by Dr Lavinia R Davis

Nassau County

DR SPENCER T SNEDECOR, president of the New Jersey State Medical Society, spoke on methods of providing medical care for the under-privileged at a meeting of the Medical Society of Nassau County in the Bar Association building, Mineola, on March 30

New York County

A SYMPOSIUM ON CANCER was held at the International Medical Center, 135 E 55 St., New York City on April 14

THE 445TH REGULAR MEETING of The Society of Medical Jurisprudence, held at The New York Academy of Medicine Building, on April 12, had on its program "Preliminary Survey of 1000 Case Histories of Inmates of Elmira Reformatory" by René Breguet, M.D, Neuro Psychiatrist, Elmira Reformatory Discussion was opened by Amos T Baker, M.D, and John Kirkland Clark, Esq

Niagara County

DR HARRY R TRICK, F.A.C.S., was the speaker at a meeting of the Niagara County Medical Society at the Hotel Niagara on April 13 Dr Trick gave an evaluation of present-day methods of diagnosis, treatment and operative procedure for abdominal hernia

Oneida County

DR GEORGE MINER MACKENZIE and Dr A Graham Davis addressed the Oneida County Medical Society in Utica April 13 The former spoke on "The Treatment of Pneumonia from a Laboratory Standpoint" and the latter on "The Newer Treatments of Chorea"

Onondaga County

CONTINUANCE OF THE "WHAT'S NEW" programs of the Onondaga Medical Society and Syracuse Academy of Medicine has met with great favor At the Medical Society meeting on April 6, Dr A Clement Silverman spoke on "What's New About Scarlet Fever" Other papers were read by Dr J Ernest Delmonico and Dr A. N Curtiss, with Dr F S Wetherell and Dr Albert G Swift opening the discussions Dr Harry A. Steckel spoke on "What's

New About Dementia Praecox" before the academy members in session April 20 at the University Club Other speakers were Dr William E Ayling and Dr Nathan P Sears, with Dr H B Doust and Dr Donald Childs opening the discussions

Ontario County

THE ONTARIO COUNTY Medical Society met on April 15 at the Geneva General Hospital Speakers included Doctors M E Deuel, Robert F Doran and J A Gindling, and other members of the hospital staff

DR WILLIAM WEHR addressed the Geneva Academy of Medicine on April 15 at the Geneva Country Club

DR W C ELKNER, of the Clifton Springs Sanitarium and Clinic staff, was guest speaker on April 8 at the monthly meeting of the Canandaigua Medical Society Dr Harry M Smith was host Dinner was followed by Dr Elkner's paper on "Carcinoma of the Prostrate"

Oswego County

THE MEDICAL SOCIETY OF OSWEGO county met Wednesday evening, April 7 Guest speakers were Dr Richard S Farr, Syracuse, orthopedic surgeon to the University and Memorial Hospitals, and Dr Lee Hadley, roentgenologist of Memorial Hospital, Syracuse "Back Pain" was the subject discussed The symposium was illustrated by lantern slides and x-ray films

Queens County

UNDER THE AUSPICES of the committee of graduate education of the Medical Society of the County of Queens, Dr W Guernsey Frey spoke on "Eye Ground Studies for the General Practitioner" at the meeting of the Society on April 7 at the Society's building Dr Frey, who is a resident of Forest Hills, is an eye surgeon at the Manhattan Eye, Ear and Throat Hospital and ophthalmologist at St. John's, St. Luke's, the new Queens General and Misericordia Hospitals

"OLD TIMER'S NIGHT" of the Queens County Society will be celebrated on May 22 at the Society's building It will be an evening of entertainment intended to create a fund to redeem building loan bonds belonging to the estates of deceased subscribers At least one hundred prizes donated by local merchants and varying in retail value from \$5 to \$25 will be distrib-

uted to those subscribing The subscriber, for one dollar, will receive a booklet (which is also a ticket of admission) containing descriptions of the prizes There is no limit to the number of prizes for which each participant is eligible Together with the promise of adequate collation and dance music, the prospect of an enjoyable, and possibly profitable evening is assured everyone who attends

Rensselaer County

TWO PAPERS DEALING WITH tuberculosis were presented at the meeting of the Rensselaer County Medical Society on April 13 Dr Robert E Plunkett dealt with "The Diagnosis of Pulmonary Tuberculosis" and Dr J J Randall read a paper on "Collapse Therapy of Pulmonary Tuberculosis"

Richmond County

THE ANNUAL DINNER-MEETING of the Richmond County Medical Society took place on April 14 in the Fox Hills Country Club

St Lawrence County

THE COMMITTEE ON Public Health and Medical Education of the St Lawrence County Medical Society arranged spring lecture course starting on April 15 There were four lectures on the program as follows

April 15—Dr Edward C Hughes, Obstetrician, Memorial Hospital, Syracuse, "Toxemias of Pregnancy"

April 22—Dr Charles B F Gibbs, Physician General, Assistant Physician, Strong Memorial Hospital "Diabetes"

April 29—Dr Carroll Spaulding Wright, Professor Dermatology and Syphilology, Jefferson Medical College, Philadelphia, "Diagnosis and Treatment of Syphilis"

May 6—Dr Henry Hausman Ritter, Associate Traumatic Surgeon Postgraduate, Reconstruction Unit Postgraduate, Hospital Consultant Surgeon, St Luke's Newburgh, Long Beach and Passaic, "Back Injuries"

The lectures were held in the auditorium of the Hepburn Hospital

THE CITY MEDICAL SOCIETY of Ogdensburg held its regular meeting on April 7 Dinner was followed by a lecture by Dr Donald Tulloch on cardiac diseases An interesting demonstration was given in the uses of the cardiograph

Saratoga County

DR ARTHUR W JOHNSON, coroner for more than twenty years, was honored on April 7 at a testimonial dinner in the Mechanicville Masonic Temple by the Saratoga County Medical Society

Dr W S McClellan paid tribute to Dr Johnson for his fifty years in practice Dr William VanDoren presided and Dr E. McDonald Stanton read a paper on hernia The dinner was held after the society meeting

Schenectady County

DR CHARLES C DURYEE, of Schenectady, who died on March 18, was a past president of his county medical society and had been twice mayor of the city

Steuben County

DR M A PLACE was elected president of the Hornell Medical and Surgical Association at the annual meeting on April 7 at the Hornell Country Club Dr J J Yanick was named vice president and Dr W James MacFarland, secretary and treasurer

During the dinner, members presented Dr L M Kysor with a movie camera for his trip to Europe

Sullivan County

THE STATE DEPARTMENT OF HEALTH'S pneumonia control exhibit was taken to Monticello for a mass meeting April 8 sponsored by the Sullivan County Medical Society and the Tuberculosis and Public Health Association Dr Howard S Rogers, director of the State Bureau of Pneumonia Control, and Dr Frank Laidlaw, district state director of pneumonia, were among the principal speakers Dr Rogers spoke on April 7 at a meeting at Carmel sponsored by the Putnam County Medical Society for members of the profession

Tioga County

THE ANNUAL COURSE of lectures for members of the Tioga County Medical Society was as follows

March 24, Dr V P Mazzola, F A C S, "Puerperal Infection"

March 31, Dr F R Marzullo, F A C P, "Uremia, Its Symptoms and Its Management."

April 7, Dr G H Roberts, F A C P, "Recent Advances in Therapeutics"

April 14, Dr A F R Anderson, F A C P, "Newer Concepts of Peptic Ulcer and Its Modern Treatment."

April 21, Dr S S Lamm, "Neurological Conditions in Childhood"

Warren County

AT THE SEMI-ANNUAL DINNER MEETING of the Warren County Medical Society on April 14 in The Queensbury at Glens Falls Dr Eldridge H Campbell of Albany gave a lecture on "Early Diagnosis and Treatment of Brain Tumors," illustrated with lantern slides

DR SAMUEL A LEVINE of Boston, Mass., read a paper on "Some Pitfalls in the Diagnosis of Heart Disease" at a meeting of the Glens Falls Academy of Medicine on April 9

Washington County

THE MEDICAL SOCIETY of the County held its quarterly meeting on April 2 at Granville The program "Indications for Surgery and Indications for Radiation in the Modern Treatment of Cancer," Dr William J Hoffman, and "The Laboratory as a Diagnostic Aid in the Practice of Medicine," Dr Arthur W Wright.

DR CLIFFORD W SUMNER, of Granville, who died in March, was a past president of the Washington County Medical Society

Westchester County

MORE THAN SIXTY physicians have volunteered to set aside special office hours one day a week for the examination of pre-school children whose parents are unable to pay a fee, Dr John M Dill, chairman of the public health committee of the Yonkers Academy of Medicine, announces The number of volunteers is an increase of twenty over last year and does not include specialists who have promised to do free pre-school work in their own field More than 800 children were not reached last year, Dr Dill pointed out He said that doctors are "greatly interested" in having remedial defects found and corrected and to have toxoid administered before school opens

DR CHARLES SUMNER BENEDICT, of New Rochelle, who died in April, was a past president of the Westchester County Medical Society

Hospital News

Hospital Survey Urges Drastic Changes

THE HAPHAZARD DEVELOPMENT of institutions and facilities for the care of the sick in the metropolitan area is scathingly scored in the report of the Hospital Survey for New York, just made public. For two years the investigation has been probing into conditions in the 800 hospitals, institutions, and agencies for the sick in the five counties of New York City and adjacent counties in New York State, New Jersey, and Connecticut, having all told around 11,000,000 souls, with a prospect of 18,000,000 by 1960.

To remedy the waste and lost motion and misdirected effort now prevalent, the Survey urges the creation of a permanent planning group, to coordinate and harmonize the work of the hospitals, dispensaries, and other such agencies, and to bring order out of chaos. Dr. Haven Emerson, Director of the Survey, said on April 28 at a luncheon at the Hotel Pennsylvania:

"There has been nothing more ruthless in industry and commerce, more reckless of social morality, more rugged in its autocratic autonomy than the conduct of campaigns of individual institutions for this, that or the other utility for the sick.

"The remedy seems to us to be the development of a permanent representative, authoritative planning group so informed and made currently aware of the facts of each situation, and so independent of class, institutional or political loyalties that its judgment in all projects involving capital expenditures will be sought, accepted and respected."

"We recommend," he continued, "that no more general hospitals of less than 200 beds be built in New York City, or with rare exceptions anywhere in the metropolitan area, and that such small hospitals as are now used to poor advantage be merged with larger institutions, and that the number of such of the specialty hospitals as are relatively unoccupied be decreased through merger with general hospitals."

The survey group held, too, that only

those voluntary hospitals actually serving a public purpose should receive tax exemption.

"Several institutions at one time offering a substantial portion of their beds for the care of free patients and thus justifying a tax-exempt status now so limit their admissions to paying patients that it is doubtful if the State and city government should continue to include them in a privileged class," said Dr. Emerson. "Hospitals serving almost exclusively paying patients should have the status of proprietary (profit-making) hospitals even though the motive of the corporation is not wholly that of profit earning."

The survey group recommends, Dr. Emerson continued, that hospital authorities collaborate with their medical staffs to consider a means of providing some compensation for physicians serving the indigent. It urged, too, that "it seems only a policy of intelligence and justice to see that the non-professional personnel of hospitals be paid in full by salary, or by salary supplemented by part or full maintenance, at rates corresponding to those paid for similar work by non-philanthropic establishments in the same community."

Another recommendation, as reported by Dr. Emerson, urges the doubling of the number of nurses assigned to the care of the sick in their homes, this increase to be effective by 1940 at the latest. No other organized service for the sick costs the community and the patient so little for "such large returns in skill," said Dr. Emerson. Medical social service activities should be substantially expanded, he added.

There is no need, the survey showed, for an increase in beds for maternity cases or for children. More beds are needed, however, for mental cases, about 1,900 more beds for tuberculosis patients and 650 more beds for venereal disease cases. Additional cancer clinics should be organized, Dr. Emerson said, additional outpatient dental services should be set up and the city should provide insulin for indigent diabetics under the care of voluntary institutions.

Drama as an Emotional Cathartic

ADOLESCENT GIRLS in a psychiatric ward at Bellevue Hospital have been presenting dramatic entertainments every week for the last eight months under direction of the Community Drama Unit of the WPA Federal Theater Project. Dr Karl M Bowman, director of the hospital's psychiatric division, disclosed the other day

The experiment has proved so successful that Dr Goldwater gave permission to Dr Bowman and Dr Nathaniel Ross, who has supervised the work, to meet reporters and to describe their observations

The benefits of the project, they said, had been threefold. Enactment of plays induced in both actors and spectators the reaction which Aristotle, more than 2,000 years ago, declared to be the basic aim of the drama—namely "catharsis," or a purgation of the emotion through art, the project was of diagnostic value, for in writing original plays the patients had set forth the specific problems that were at the root of their own disorders, and participation in a common undertaking sped the "socializing process"

Dr Bowman said that some of the productions had been staged with astonishing skill. Recently the patients presented the balcony scene from "Romeo and Juliet." Juliet was enacted by a girl afflicted with a congenital mental disorder. Supposedly deficient in concentration and

memory, she nevertheless learned her part eagerly, spoke her lines without prompting and in her general interpretation showed a surprising degree of sensitivity and understanding. The role of Romeo was assumed by an overgrown girl of thirteen whose consuming desire to be a boy found an outlet in the work at hand.

Discussing the project as an aid to diagnosis, Dr Bowman said "In composing plays the girls give themselves away. Perhaps at times they manifest things which they don't even appreciate themselves. They show by their attitudes and behavior certain mental problems which have been very deep set, which you could not disclose by simply asking questions."

He then cited the case of a patient who had written a play about an automobile accident. In it the protagonist, a girl, causes her brother's death by diverting her father's attention while he is driving. The car swerves and crashes. All but the boy survive. The stricken mother at first berates her daughter for causing the accident, then forgives her, realizing that destiny rather than the girl was to blame. Struck by the curious plot, the psychiatrists drew the author gently into a revelation of how, at the age of eight, she had killed her four-year-old brother by throwing him out of a window. Her mother had never forgiven her—and that was the cause of her maladjustment.

Largest Supply of Radium is Here

WITH THE DELIVERY of another gram of radium, the New York City Department of Hospitals will have the largest single supply in the world. The additional gram will make the city owner of seven grams. In addition, the cancer division of the Department of Hospitals has five more grams which have been on loan for more than five years. The gram just purchased cost \$24,912.50, the lowest price on record. Five years ago the same amount of radium, George T Taylor, sales manager of the radium company, said, would have cost \$70,000. Lower production costs and exploitation of better sources of supply have decreased the cost of radium.

The new gram of radium will be used

at the Brooklyn Cancer Institute in Kings County Hospital. The institute already has prepared a special safe, lined inside with a four-inch thickness of lead, where the radium needles and tubes will be kept while not in use.

The city's radium purchase included fifty-eight platinum tubes filled with radium, ranging from five to fifty milligrams of the salt. A milligram is one-thousandth of a gram, and a gram of the salt amounts to about a thimble-full.

In addition, the gram of radium included 100 needles with two milligrams of salt each, and twenty-five needles with three milligrams.

Mr Taylor said that the trends in can-

cer treatment could be traced in part by the size of the so-called radium applicators, or containers

During the past ten years, he said, the size of the containers had been gradually decreasing because cancer specialists now

believe in imbedding radium needles and tubes in the cancerous tissue for a period ranging up to six days

The older method called for concentrated treatment with the needles imbedded for a period of twenty-four hours

Improvements

OF THE \$14,095,540 recently announced as allotted by the Public Works Administration in Washington, to non-Federal hospitals in New York City, \$4,252,650 went to municipal hospital improvements in Brooklyn and Queens, according to figures made public by Dr S S Goldwater, Commissioner of Hospitals

In disclosing the PWA allotment totals for his department in Brooklyn and Queens, Dr Goldwater explained that if urgent departmental expansion and improvement are to continue in the two boroughs, the Hospitals Department must receive the appropriations listed for it in the 1937 capital outlay budget

As pruned by Mayor La Guardia, the Hospitals Department's capital outlay budget includes \$2,447,000 for starting new hospital projects in Brooklyn and Queens between April 1, 1937, and March 31, 1938. These projects, when completed, are estimated to cost a total of \$7,457,000

Foremost on the Brooklyn-Queens list under the proposed capital outlay budget program is \$1,000,000 to start the new Triborough Hospital for tuberculosis patients, adjoining Queens General Hospital. This 500-bed institution, which would cost \$3,000,000, according to Dr Goldwater, is "planned to meet a need long recognized by the department and stressed as exceptionally urgent by the Department of Health and by civic and social agencies that are familiar with the tuberculosis problem"

Next comes \$750,000 to begin construction of a new hospital for chronic cases designed to replace several of the old buildings at Kings County Hospital. Each of the old buildings to be replaced, according to the commissioner, is a "recognized fire hazard" and all have been condemned repeatedly. The total cost of this unit has been put at \$2,750,000

Work would start on construction of the proposed psychopathic pavilion at Kings County Hospital under a \$500,000 authorization which Dr Goldwater is seeking in his

new capital outlay budget. Estimated to cost an eventual \$1,500,000, this unit, according to Dr Goldwater, would "relieve a distressing situation"

"This project," the commissioner explained, "calls for 300 new beds for psychopathic cases. A recent authoritative survey has demonstrated that 700 beds are needed in this division over and above the facilities that are now available"

. . .

A COMMISSIONER'S RESIDENCE and infirmary, to cost \$500,000, are to be added to the State Hospital at Yaphank

. . .

OVERCROWDING AT THE Greenpoint Hospital has roused the civic workers of Williamsburg to start agitation for a new hospital

. . .

FRIENDS OF THE Jewish Hospital of Brooklyn have given \$25,000 to renovate the maternity building

. . .

ELECTRIC MAGNETS to remove metal particles from eyeballs have been installed in St Peter's Hospital in Albany

. . .

THROUGH THE GENEROSITY of a number of friends, Huntington Hospital has added a fine new station wagon to its equipment

. . .

THE CLIFTON SPRINGS SANITARIUM has added apparatus for deep x-ray therapy and entire new equipment for diagnostic Roentgenography is being installed. Expenditures for these amount to \$13,000. Cash subscriptions and pledges from friends amounting to more than \$25,000 have been received toward retiring the mortgage on its property for the construction of its hospital building. The small balance due on the mortgage will be refinanced—Reported by Adrian S Taylor, M D, *Superintendent*

Newsy Notes

AS AN AFTERMATH OF THE fatal blaze in the Israel Zion Nurses Home, Brooklyn, the Kings County Grand Jury has recommended that all hospitals and nurses' homes in the borough have thorough fire inspections every month. The presentment read in part

"From our investigation of the disastrous fire which occurred on Jan 17, 1937, at the Nurses Home of the Israel Zion Hospital, resulting in loss of life, we believe that in the interest of public safety the attention of proper authorities should be called to the necessity of establishing routine periodic inspections for all hospitals and nurses' homes connected there with

"Evidence showed that periodic inspections of these facilities have not in the past been required. Due, however, to the great public interest that this catastrophic aroused, belated inspections were immediately instituted revealing many unsafe conditions

"Therefore, we urgently recommend that all such public and semi-public facilities in the county be inspected for violations of fire ordinances regularly once each month and that any failure to remove such violations be promptly referred to the Magistrates courts for appropriate legal action"

A TOTAL OF 254,897 New Yorkers are enrolled in the three-cents-a-day plan for hospital care, Karl Eilers, president of the Associated Hospital Service of New York reports to the board of directors. Of these, Mr Eilers said, 90,000 have subscribed through the family membership plan, started last fall. Frank Van Dyk executive director, said added impetus to enrollment, now three times what it was last May, at the end of the first year's operations, was given by the family plan, seven-cents-a-day inclusive for families subscribing by the pay roll deduction method. This plan insures husband wife and all unmarried children under nineteen years of age hospital care in any one of 240 member hospitals in the metropolitan area

THE ANNUAL HOSPITAL MEETING of the Syracuse Academy of Medicine was held on

Mar 16 at Syracuse Memorial Hospital. 'Hyperthyroidism in Childhood,' first of four parts of the program, included a case report by Dr Arthur B Raffi and a discussion by Dr George M Retan. Dr William A Groat led a discussion of a report on methods of bone marrow studies presented by Dr Ellery G Allen and Dr Tyree C Wyatt. A report of a case of "Xanthomatosis, the Schuller-Christian Disease," was given by Dr Edward J Wynkoop. Dr Lee A Hardley conducted the discussion

. . .

SUCCESS IN THE EFFORT to conserve child life alone will arrest the trend toward a stationary population figure in the United States, a biennial report of the New York Foundling Hospital asserts

"In this age of diminishing births," the report says, "the approach of the time of stationary population in the United States can only be stayed by the success of the pediatrician in conserving infant life"

Covering the operation of the hospital for 1934 and 1935 the report points to a death rate for the two years of fifteen children per 1,000 admissions

"At the time the hospital was founded," the report states, "the infant mortality rate was 250 per 1,000, and the foundling mortality was nearly 100 per cent. Today the death rate of babies under one year is forty-eight per 1,000 births, and ours is fifteen per 1,000 admissions, some of our children being over one year old when admitted"

Covering the years during and immediately following the worst of the depression, when there was a consequent lowered vitality among patients, the maternity department statistics show a death rate among mothers of 35 per 1,000 for 1934 and 15 per 1,000 for 1935, as compared with the national rate for the same years of twenty-six and twenty-three per 1,000 mothers, respectively

. . .

A DRIVE FOR BOOKS AND MAGAZINES to be sent to Grasslands Hospital has been opened in the Tarrytowns by the Women's Auxiliary of Spencer-Kelly Post American Legion

. . .

THE CHARITY EYE, EAR, and Throat

Hospital of Erie County gave a dinner on Feb 25 for Dr John Dodds Flagg for his forty-five years' service to the hospital, of which he is chief surgeon and executive medical officer. A newspaper notice remarks

"Dr John Dodds Flagg is only seventy-seven years old and has been in Buffalo only forty-nine years, but he has 115 years of gratuitous medical service for the people of this city to his credit.

"His services to Buffalo institutions and citizenry include

"Thirty years as physician and surgeon of the Sisters of St. Francis asylum

"Twenty years on the faculties of the Niagara University Medical school, when it was located in Buffalo, and the University of Buffalo Medical school

"Ten years as surgeon at the old Erie County hospital

"Five years as lecturer in ophthalmology to the nurses in the Erie County hospital

"Five years as lecturer in physiology to the nurses of the old Women's hospital

"All these services have been donated by Dr Flagg. Today he is connected only with the Charity Eye, Ear and Throat hospital"

The medical and nursing staff gave Dr Flagg a basket of forty-five roses, and the

entire personnel of the hospital gave him a purse of \$450 . . .

AN INTERESTING SUGGESTION appears in this letter to the *Journal of the AMA* from Dr W A McMillan, of Charleston, W Va

"Our hospital staff formed a luncheon club. We meet the same day each week at 12 30. The club is known as the A M A. Club. Three of the most interesting articles of the *Journal* are chosen by the chairman of our club. One of these articles is given to each man to digest and present a summary of the article. He is given five or six minutes to do this. The chairman of the club also in a five or six minute talk gives a review of the principal articles of the *Journal*. The result of this has met with favor in that every man feels that he is missing a great deal when he neglects reading his copy of *The Journal*. Especially do the men whose duty it is to give a digest of the articles get a great deal from the subject discussed"

. . .

DR FRANK H CLARK, former chief of the surgical staff and one of the founders of Bushwick Hospital, Brooklyn, died on March 3 in Prospect Heights Hospital, Brooklyn, after a three-week illness. He was seventy-five.

At the Helm

The following hospital officials have been elected

DR. JAMES C WALSH, to be superintendent of the Nassau County Sanatorium at Farmingdale

LEONARD A LUBBOCK, to be Superintendent of Faxton Hospital at Utica

HERMAN RINGE, to be President of the Wyckoff Heights Hospital

FRANK N CLINTON, to be President of the Peekskill Hospital

MISS LAURA OTT, to be Superintendent of the Tioga General Hospital at Waverly

MISS JUNE MOE, to be Superintendent of the new Oneida City Hospital

DR. CHARLES D PARFITT, to be chief physician at Loomis Sanatorium at Ellenville

SAMUEL ROFFMAN, to be President of the Hebrew Hospital Association at Monticello . . .

DR RICHARD H BENNETT, senior attend-

ing physician of the Brooklyn Home for Consumptives, has been appointed medical director, to succeed the late Dr Luther F Warren. Mrs Oscar W Swift was re-elected president of the board for her seventh consecutive term

. . .

G BEEKMAN HOPPIN, of Oyster Bay, is the new president of the Nassau Hospital association. Mr Hoppin has been an active director of the corporation which conducts the Nassau Hospital in Mineola for several years. He is also a director of the New York Hospital

. . .

NATHAN S JONAS has been reelected president of the Brooklyn Jewish Hospital

. . .

EDWARD MOORE ROBINSON has been elected president of Knickerbocker Hospital, New York City. He succeeds William B Symmes Jr, who has been president five years

LORENZ J. BROSNAN, ESQ

Counsel, Medical Society of the State of New York

Malpractice—Requirement of Expert Testimony to Establish Cause

An interesting decision was handed down very recently in one of the Mid-Western States which resulted in the exoneration of a physician of charges of malpractice in connection with the treatment of a difficult fracture case*. The action was one instituted by a patient charging negligent treatment by two physicians from whom he sought to recover the sum of \$40,000 as damages.

The case arose out of the treatment of certain injuries which the plaintiff, one P sustained when he was involved in an automobile accident. The patient was taken the day of his injuries to a hospital where he came under the care of a Dr R, a general surgeon. X-rays promptly taken revealed a compound comminuted fracture of the right femur about 2½ inches above the knee joint, and a compound comminuted fracture of the tibia and fibula of the same leg a similar distance below the joint. Dr R, assisted by a Dr H promptly informed P of the severity of his injuries and told him that they would attempt to save the leg if possible.

Due to the fact that the fractures were compound, an attempt was promptly made to get the bones in as good alignment as possible, and to apply immobilizing agents, but no operation was performed at the time, on account of the danger of infection. It was decided by the doctors that the treatment required included the necessity of a metal plate to hold the fragments in position.

Five days later R. and H. operated and applied a Lane plate to the fractured femur, fastening it with five half inch screws. A cigarette drain was used in closing the wound, and a splint was applied to the leg and a Buck's extension applied. According to the testimony upon the trial, after the operation, an eight-inch board, with "cotton and other stuff" on it, was placed under the leg from the heel to the hip, with foot boards nailed to the board forming a box. The leg was taped in this box. The patient complained of pain caused by the box when his leg started to swell a few days after the operation. An infection developed in the wound above the knee with a dis-

charge of pus which continued for some time.

It appears that about ten days after the operation there was a bed pan accident. In some manner while the patient was using a bed pan, it slipped, and according to P he was caused to fall to the bed. Upon the trial he claimed that at that time the leg "popped, jumped and hurt so that it nearly threw me into spasms, my leg jumped and jerked and hurt so badly that I told the nurse that my leg was hurt badly, that the plate had come off or that I had broken my leg over, I didn't know what had happened." According to the patient Dr R was told of the happening the next morning but he administered no treatment. According to P while he remained in the hospital the two doctors saw him very seldom. Dr R, however, testified upon the trial that he saw the patient practically during the entire period of a month that he remained in the hospital. During that time, according to R, he made numerous changes and adjustments in the apparatus, and at various times dressed the injuries. When the patient left the hospital, the injured limb was still in the fracture box, and according to R the patient left the hospital against his advice and without his consent.

When P left the hospital he was taken to his home by ambulance. Dr H was called in two days later, and removed the box. Dr H was told by P at the time that R. had authorized its removal, although R. insisted he had given no such instructions. From that time on P had little or no medical attention. According to both doctors, when they last saw the plaintiff his legs were of equal length.

When P appeared in court upon the trial, his injured leg was three inches shorter than the other. He told of remaining in bed for a couple of months and of gradually getting up in a chair, and that about four months after the injury he began walking with the aid of crutches. X-rays taken before the trial showed that the screws of the Lane plate had given way, and that the plate had loosened, with over-lapping of the fragments of the femur.

The plaintiff conceded upon the trial that the operation had been skillfully and properly performed, but claimed that the

* Pedigo v. Roseberry, 102 S W (2nd) 600

fracture board had been improperly set up so as to cause unnecessary pain, and that the bed pan accident had thrown the fragments out of alignment, and dislodged the Lane plate causing a condition which the defendants R. and H. failed to correct while they cared for him. He claimed that the said incident led to his final resulting deformity and that consequently defendants were responsible for his condition.

Upon the trial various physicians who testified were all in agreement that they could not from the late x-rays determine when the Lane plate had become loosened, which fact developed into the chief point in the case.

The trial of the action resulted in a jury verdict in favor of the defendants, but the trial Court ordered a new trial. From that order the two physicians appealed, and the Appellate Court finally directed a reinstatement of the verdict of no cause of action.

In the course of a well-considered opinion the Appellate Court said:

It was tried on the theory that the issue of negligence vel non revolved around the degree of care and skill ordinarily possessed and exercised by physicians and surgeons in good standing in Springfield and similar localities in the treatment of a human leg for a compound comminuted oblique fracture of the femur and a compound comminuted fracture of the tibia and fibula under all the attending facts and circumstances detailed in evidence. One of the functions of the knee is the greater freedom of motion of the leg and motion of the leg is, in part, the result of the action of the muscles on the bones of the leg. With the bones of the leg fractured a short distance above and below the knee the contraction of the muscles would not be toward the alignment of the bone fragments. Respondent founds no claim on the existence of infection, which, we understand, may occur irrespective of the skill and care exercised in treating an injury of the nature of respondent's. Respondent's injuries presented nonvisible internal physical conditions, and the physicians and surgeons testifying in the case as experts not only relied upon the history of the case, their observation and examination of his condition, but based their testimony largely on his condition as disclosed by the x-rays. Laymen may readily understand the need of stabilizing supports to maintain the proper alignment of a stick broken into three fragments, one of the breaks being oblique, if force be exerted against either fragment. The problem presented to appellants, however, must have been somewhat unusual, complicated, technical and difficult even for those versed in the science and art of medicine and surgery, for two practicing physicians who were witnesses did not testify as "experts" on the ultimate fact. The litigants treated the issue as one not within the experience and knowledge common to mankind. So, under all the facts and cir-

cumstances of record in the instant case, whether or not, on one of the issues, a fracture board paining respondent at his hip should have been removed to relieve the pain within a few days after the performance of the admittedly successful surgical operation at the possible sacrifice of the successful results theretofore secured and the risk of further complications, or whether or not, in the other issue, respondent's fall from a bed pan to a mattress ten or twelve days after the operation loosened the Lane bone plate and refractured his femur or disaligned its fragments and the deformed condition of said leg as disclosed by x-rays taken more than a year thereafter was the result of said fall and subsequent improper medical and surgical treatment and attention or the removal of immobilization agents and the pull of the muscles against the bone fragments or the premature activity and use of the leg by respondent were, we think, matters to be determined from the testimony of witnesses possessing the necessary experimental qualifications acquired through study, training and experience on the subject-matter and not from the testimony of the ordinary layman.

If laymen are not to be guided on issues requiring peculiar and thorough special training in a science or art beyond the experience and knowledge common to mankind by witnesses possessing the necessary testimonial qualifications, juries will be cast into a river of doubt and must establish an arbitrary standard of their own founded upon conjecture and surmise in their effort to reach certain and sure ground. Juries should not be thus turned loose and privileged to say, perchance, the method of treating an injury of the nature here involved was negligent notwithstanding, for instance, the uncontroverted competent testimony establishing that the uniformly adopted practice of the most skillful surgeons had been followed. Notwithstanding the prerogative of practicing lawyers, the general public, no doubt considers the members of the judiciary competent to observe accurately, reason correctly and report truly on intricate and involved legal issues, but would not place such confidence in their testimonial qualifications on an issue involving the intricacies of, for instance, television, Einstein's theory of relativity etc. Nor should a jury of laymen be permitted to establish by laical conjecture and surmise the degree of care and skill exacted of a practicing lawyer in the handling of intricate and involved legal issues. On litigated legal issues both litigants cannot prevail. Upon such subjects experience teaches us that reliance must be placed in those qualified and skilled in the science or art involved.

We find no evidence of record from which it might be inferred that proper treatment called for the removal of the fracture board to relieve the pain at respondent's hip. And, aside from other possible reasons, all that the evidence disclosed with reference to the cause of the crippled condition of respondent's leg was that it might have resulted from one or more of several causes, and that it was caused by any negligence of appellants was not removed from the realm of conjecture and surmise.

Across the Desk

"Sick, Broke, and Footloose"

THAT IS THE DESPERATE CONDITION, it seems, of thousands of victims of tuberculosis who have left their homes and found their way, on foot, on brakerods, or in ramshackle automobiles, to the States of the Southwest, where they form a big problem. No exact census of this sad and wandering army is possible, of course, but rough estimates figure it at from one to five thousand. Many are accompanied by their wives, or husbands, and by groups of ill-clad and half-starved children. By day they straggle along the highway, and by night they pause in jungles, shacks, or cheap flophouses.

They are more than a pitiful horde of the ill—they are a peril to all they meet, for each one is a prolific sower of the seed that causes tuberculosis, and even the most careful and respectable citizen cannot avoid contact with them at the filling station, restaurant, tourist camp and lodging house. They have lost claim on the home towns they have deserted and are strangers in the States where they are seeking health, so that no one is under any obligation to feed them, shelter them, nurse them, or bury them. They have disregarded the advice of doctors and health officers to "get well at home," and have set off in a fatuous hope that merely inhaling the air of the Southwest will heal diseased lung tissues, without the needed rest, food and medical care they could better have had at home.

Halting the Perilous Army

Mistaken and even blameable as they may be, however, there they are. Something must be done for a situation so full of tragedy and danger, and we are told that something has been done and more will be done. Dr. H. E. Kleinschmidt, of New York City, Director of Health Education of the National Tuberculosis Association informs us in *The Journal-Lancet*, of Minneapolis, that the Emergency Relief Administration started three years ago to set up transient shelters in an effort to "freeze" the army of homeless wanderers. In Nogales, Arizona, an old army barrack used during the Mexican border dispute was utilized. Doctors and nurses

were brought in and soon "tuberculosis units" were running full blast.

In spite of makeshift equipment and labor drawn from transients not too ill to work, we are assured that these units performed a heroic and creditable service. Some of them were almost completely self-contained, they sheltered patients, maintained a farm, killed and dressed their own beef, manufactured crude coffins and buried their dead. Social workers investigated each case, returned some to their homes, placed the families of others in shelters, and helped solve individual problems.

Best of all, remarks Dr. Kleinschmidt, some five hundred patients known to have communicable tuberculosis were "taken out of circulation," so to speak, and given at least the first essentials for recovery—rest in bed and nourishing food—at a cost of less than a dollar a day per patient! Perhaps no relief money was ever better spent, he thinks, from a social viewpoint.

Consternation in Camp

Consternation struck the camps, however, when word arrived last fall that the time had come for the Federal Government to liquidate its transient service. There was no hope of transferring the activity to state or local budgets. Would the sick be turned out into the desert?

By good fortune the fine work of the units attracted the favorable attention of WPA officials, who found they had a small unexpended fund, and a temporary stay of the threatened collapse was arranged. No new patients, however, could be taken in.

That seems to be the present situation, but happily it is not as bad as it sounds, for such powerful agencies as the U. S. Public Health Service, the National Tuberculosis Association, the American Public Welfare Association, the National Committee on Care of Transient and Homeless, and the Continuing Committee of the Interstate Conference on Transients and Settlement Laws are interested and giving their attention to it. That insures that something will be done.

Meanwhile, there is a very practical thing

that everyone can do, and that is to spread the gospel that it is far better for the victim of tuberculosis to stay in his home community, where he has his friends and relatives and his family doctor to aid him, than to cut loose from all these ties and become a wanderer in a strange and inhospitable land. The sole idea that has sent these miserable thousands on their mistaken quest is that some magic in the air of the South-

west will bring them renewed life. Give them instead the truth that home is the best place for them, tell it to them by radio, by "health talks" in schools, in public forums, in the press, and in private counsel and casual conversation, till it is driven home firmly into the public mind, and then the stream of pallid health-seekers will never start, it will dry up at its source, and the problem will solve itself.

"A Good Name is Rather to be Chosen Than Great Riches"

THE MOST PRECIOUS TREASURE of the medical profession is its good name. The entire Code of Ethics is built upon it, and it is what distinguishes the true physician from the charlatan. So it is no wonder that swindlers and fakers are busy all the time trying to buy, beg or borrow some of the good name to dress up and rig out their humbuggery and sham.

Their latest try is reported from Indiana, related in the *Journal of the Indiana State Medical Association*. It appears that for several months Indiana doctors have been receiving cards offering them a weekly wage of \$25, plus commissions, for their services. The fishing was apparently not very good, so the bait was raised to \$40. These offers naturally aroused curiosity, and investigation revealed that the cards were sent out by a chain store optical outfit, which hoped to prosper by using the names of physicians in good standing.

We are told what happened to one doctor who fell for the scheme. He was informed that his duties would consist of making "manifest" refractions, or refractions in which no cycloplegic is used, and that he would receive so much for each re-

fraction. It was further suggested that he sign the lease for the offices!

Things soon began to happen. First the Better Business Bureau of the city smelled a rat. Then an enterprising newspaper sent a reporter over to have his eyes examined, and the Bureau and the reporter together began to raise merry hades. As a final touch, a representative of the Indiana State Board of Medical Registration and Examination paid a call and gave the doctor a taste of tabasco to the effect that a licensed physician who lent his professional self to an unlicensed practitioner might find his Indiana standing in jeopardy. The result was that the budding refractionist immediately returned to his native heath, convinced that he was definitely through with such a game. Unfortunately the game was not through with him, however, for his reputation is under a cloud and he will always realize the truth of Shakespeare's saying that "he that filches from me my good name makes me poor indeed."

The jig is up for the chain store fakers in Indiana, and their only recourse will be to try new territory. Will it be New York State?

The Safest Automobile Drivers

WHO ARE THE SAFEST automobile drivers? The deaf, dumb, and blind. No official statement has been issued to this effect, but it is a fact that we see no news items in the papers about accidents to cars driven by deaf, dumb, and blind people. And why? Because they are the most careful and cautious people in the world. They have sense enough not to try to drive cars, so they have no accidents. The blind, too, have the brains to keep away from the steering wheel, and they have no wrecks. Next on the safety list are the deaf, and now we have the official state-

ments to clinch the theory put forward above. Any readers who have been sniffing or snorting at it as something sophomoric emanating from a too youthful mind can now swallow their sniffs and snorts and learn something.

True, it is only natural to think that drivers with impaired sight or hearing are not safe drivers, but actual experience shows, oddly enough, that when the hearing is poor, the driving is good. And the reason is that a deaf driver is an extra-careful driver. A statement from the Keystone Au-

ACROSS THE DESK

May 15, 1937]

tomobile Association of Philadelphia says that "Statistics of the Pennsylvania Department of Highways revealed that deaf drivers are the safest of all classes." A communication, too, from the Volta Bureau, the central organization for the deaf, observes

In a good many states legislation to prevent the deaf from driving automobiles has been projected at different times, but in every instance a real study of the actual facts has convinced the authorities that the deaf were not only equal to hearing persons in the safety of their driving, but in many instances, far superior. The Commissioner of Motor Vehicles in the City of Boston has repeatedly gone on record as stating that the deaf were freer from accidents than any other group of the driving public. This opinion has been echoed by authorities in other places, and has been expressed very emphatically by the Conference of Executives of Schools for the Deaf, a body of men with normal hearing who have had long and close association with the deaf and know their capabilities and limitations

No "Back Seat" Driving

These interesting statements are con-

tained in an address given by Dr Douglas Macfarlan of Philadelphia, before the section on the Eye, Ear, Nose, and Throat at the Annual Meeting of the Medical Society of New Jersey. He explains that the reason why "the deaf are really safe drivers" is that "they are cautious and on the alert, because they know the risk they are taking." Deafness, he adds, "means often less distraction,—the back seat driver cannot disturb a deaf man, nor can squabbling children,—there is no interruption from casual conversation. The radio cannot be 'on' to the deaf man."

And as a clincher Dr Macfarlan quotes this flat statement by Frank A Goodwin, Registrar of Motor Vehicles of Massachusetts

"In all of our experience since the Registry of Motor Vehicles was established, there has never been an accident case on record in which a deaf man has figured"

And then there are the "dumb" drivers. The roads are full, infested, in fact, with one species of this genus, and perhaps the less said about them the better

BLUE BABIES"

That is the title of a short, crisp, significant article by a Detroit doctor who sent it in to the *Detroit Medical News* with the stipulation that his name be not mentioned. And the editor thought it so "provocative and very good" that he surrendered his editorial page to it. It goes like this

The modern mothers have put their obstetricians on the spot. In attempting to avoid the pains of labor, many of these mothers have forced the doctor to look more to the mother's comfort than to the baby's welfare. The drug medication employed today in many hospitals—the use of various barbiturates, hyoscine or nitrous oxide anesthesia in sufficient quantities to blot out memory of labor pains—is not without its dangers because of the high attendant incidence of "blue babies"

Formerly the doctor was greatly concerned if he brought a blue baby into the world. He wanted to see his babies pink and squalling as soon as they were born. With the heavy drug medication in use today, however, the majority of these babies are born blue and have to be resuscitated

A blue baby is one whose body tissues are being deprived of an adequate amount of oxygen. The chief danger to the new born infant of such a lack of oxygen is a cerebral as-

phyxia with consequent degeneration of brain cells. In cerebral asphyxia from whatever cause there may occur degenerative brain changes which the neuropathologist readily recognizes if he is able to examine the brain tissue microscopically. In case of survival this brain damage secondary to asphyxia may manifest itself in various ways—from transient twitchings in the milder forms to continued epileptiform seizures, spasticity or mental retardation in the more severe types. It is of course obvious that relatively few of the babies that are born blue suffer these serious sequelae. However, it is only fair that the expectant mother who asks for complete analgesia and amnesia in childbirth should realize some of the hazards to her child in obtaining that state. Because natural labor is so retarded by the drug medication in vogue there has been a tremendous increase in the number of cases where some form of operative interference is necessary to deliver the child. Cesarean sections, forceps or version deliveries are necessary in one-third to one-half of the cases in private hospital practice. A few years ago such a percentage of interference with the normal process of labor was unheard of!

If the mother of today wants to be delivered entirely without pain, she should at least be acquainted with the dangers so that she can weigh her own comfort against the hazards to her child born a "blue baby"

that everyone can do, and that is to spread the gospel that it is far better for the victim of tuberculosis to stay in his home community, where he has his friends and relatives and his family doctor to aid him, than to cut loose from all these ties and become a wanderer in a strange and inhospitable land. The sole idea that has sent these miserable thousands on their mistaken quest is that some magic in the air of the South-

west will bring them renewed life. Give them instead the truth that home is the best place for them, tell it to them by radio, by "health talks" in schools, in public forums, in the press, and in private counsel and casual conversation, till it is driven home firmly into the public mind, and then the stream of pallid health-seekers will never start, it will dry up at its source, and the problem will solve itself.

"A Good Name is Rather to be Chosen Than Great Riches"

THE MOST PRECIOUS TREASURE of the medical profession is its good name. The entire Code of Ethics is built upon it, and it is what distinguishes the true physician from the charlatan. So it is no wonder that swindlers and fakers are busy all the time trying to buy, beg or borrow some of the good name to dress up and rig out their humbuggery and sham.

The Safest Automobile Drivers

WHO ARE THE SAFEST automobile drivers? The deaf, dumb, and blind. No official statement has been issued to this effect, but it is a fact that we see no news items in the papers about accidents to cars driven by deaf, dumb, and blind people. And why? Because they are the most careful and cautious people in the world. They have sense enough not to try to drive cars, so they have no accidents. The blind, too, have the brains to keep away from the steering wheel, and they have no wrecks. Next on the safety list are the deaf, and now we have the official state-

ments to clinch the theory put forward above. Any readers who have been sniffing or snorting at it as something sophomoric emanating from a too youthful mind can now swallow their sniffs and snorts and learn something.

True, it is only natural to think that drivers with impaired sight or hearing are not safe drivers, but actual experience shows, oddly enough, that when the hearing is poor, the driving is good. And the reason is that a deaf driver is an extra-careful driver. A statement from the Keystone Au-

propagating in the intestinal tract and spreading by the ingestion of excreta was written long before the advent of the modern bacteriological discoveries which proved his ideas fundamentally true. He arrived at his conclusions only indirectly by the most careful study of the epidemiological data available, arranged and analyzed in such a way that, as Wade Hampton Frost has said, it is a "nearly perfect model of epidemiological study and one which should be read once as a story of exploration, many times as a lesson in epidemiology."

In the paper on "Continuous Molecular Changes," some of the broad principles concerned in the dissemination and prophylaxis of epidemic diseases are discussed. The opinions expressed on the mode of dissemination of measles, influenza, typhoid fever, and smallpox, are quite in accord with modern knowledge.

The Commonwealth Fund has wisely chosen these important papers of Dr. Snow for reprinting and the publishers deserve commendation for their skilful work in reproducing this masterpiece of epidemiological study in such an attractively bound and well printed volume.

JOSEPH C. REGAN

Recent Advances in Allergy (Asthma, Hay Fever, Eczema, Migraine, etc.) By George W. Bray, M.R.C.P. Third Edition. Octavo of 517 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., 1937. Cloth, \$5.00.

This third edition of Dr. Bray's book is a summary of results of recent research, in which nearly 3000 selected references have been collected. There are twenty-eight chapters, dealing with present known and proved phases of this much confused topic, in which the author either refutes or confirms conflicting views from his own extensive experience as a result of the intensive study of some 1000 allergic children.

Each chapter is thoroughly condensed and brought up to date. The reader does not have to wade through superfluous verbiage to get at the subject matter. Chapters on cutaneous, drug and nasal allergy, as well as on the psychological and nasal factors in allergy, are clean-cut, concise, and clear. It also contains new elimination diets and physical exercises with new references to agranulocytic angina, parotid swellings, acne vulgaris and allergy to yeasts.

This book provides, in a handy and inexpensive form, a resume of our present state of knowledge and the trend of modern research in allergy in general and its individual manifestations in particular.

This is an enjoyable book to study and would be a useful addition to any physician's armamentarium.

THOMAS B. WOOD

A System of Clinical Medicine (Dealing with the Diagnosis, Prognosis, and Treatment of Disease for Students and Practitioners) by Thomas Dixon Savill, M.D. Edited by Agnes Savill, M.D. and E. C. Warner, M.D. Tenth edition. Octavo of 1114 pages, illustrated. Baltimore, William Wood & Company, 1936. Cloth, \$9.00.

This edition as the preceding ones, deals with the study of disease, the basic principle being an attempt to discover the morbid cause in operation from symptoms presented by the patient. This makes the work exceedingly valuable to practitioners of medicine. To this tenth edition has been added descriptions of the Laurence-Moon-Biedl and Simmonds' syndromes, Pick's disease, Von Gierke's disease, Lederer's and Sickle cell anemias and much other new matter. There are new sections on bronchoscopy, oesophagoscopy, endocrine factors in the menstrual cycle, the autonomic system, and the hypothalamus, the cerebral ventricles, and cerebral angiography. All other subjects have been brought up to date.

This is almost a system of clinical medicine, and should be owned by every physician.

CHARLES SHOOKHOFF

Textbook of Medicine By Various Authors. Edited by J. J. Conynbeare, M.D. Third edition. Octavo of 1027 pages, illustrated. Baltimore, William Wood & Company, 1936. Cloth, \$7.00.

This is a book of medium size which covers the general field of medicine including diseases of the nervous system and of the skin, and is a useful book for quick reference. There are fifteen English contributors. In this edition there is a new section on renal diseases and the sections on anemia, diabetes mellitus and the pituitary gland have been rewritten. There is a new article on coronary occlusion and a revision of many others.

WILLIAM E. MCCOLLOM

Approaching Motherhood Questions and Answers of Maternity By George L. Brodhead, M.D. Fourth Revised Edition. Duodecimo of 196 pages. New York, Paul B. Hoeber, Inc., 1936. Cloth, \$1.50.

This is an admirable little book for the expectant mother. Quite different from the usual little book of this sort, it is out of the ordinary in its simplicity. In the form of

Books

Books for review should be sent directly to the Book Review Department at 1313 Bedford Avenue Brooklyn, N. Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

The Diagnosis and Treatment of Arthritis By Russell L. Cecil, M.D. (Reprinted from Oxford Monographs on Diagnosis and Treatment) Octavo of 263 pages, illustrated New York, Oxford University Press, 1936 Cloth, \$4.75

REVIEWS

Snow on Cholera Being a Reprint of two Papers by John Snow, M.D. Together with a Biographical Memoir by B. W. Richardson, M.D. & an Introduction by Wade Hampton Frost, M.D. Octavo of 191 pages New York, The Commonwealth Fund, 1936 Cloth, \$2.50

Among the epidemiologists of the Victorian era, John Snow occupied a most prominent place. To him we owe in great measure our modern knowledge on the precise epidemiology of cholera. In this vol-

ume are reprinted not only his classic treatise "On the Mode of Communication of Cholera" but also his important paper "On Continuous Molecular Changes, More Particularly in Their Relation to Epidemic Diseases."

In the treatise on cholera, Snow constructed on the basis of a "seemingly chaotic mass of facts" his conclusions on the mode of transmission and the principles of prophylaxis of the disease. His concept of a specific microorganism,

DIFFERENTIAL DIAGNOSIS IN PULMONARY DISEASES

PAUL H RINGER, A B, M D, F A C P, *Asheville, N C*

In this paper bronchography and bronchoscopy will be mentioned but in passing. Their importance is realized and referred to. The former requires a paper by itself, with the latter the author has had no first-hand personal experience—to dwell upon it would be simply to abstract the work of others.

Great advances have been made during the past two decades in the differential diagnosis of pulmonary diseases. It is estimated in the light of present knowledge that twenty years ago from twenty-five to fifty per cent of cases admitted to sanatoria for the treatment of tuberculosis did not have tuberculosis at all. This was particularly true of those institutions seeking to admit only minimal cases.

This is a rather severe arraignment of the medical profession but, as I look back, I feel that it probably is a just one. It does not mean that physicians were dishonest or ignorant. It means that according to the standards of 1937, they were relatively unenlightened and did their best with the means at hand for utilization. While I cannot name chapter and verse, I can well recall many cases that I saw between 1910 and 1925, diagnosed tuberculosis and treated as such, which, in the light of present information, I am certain were in no sense tainted with tubercle. Some of these cases were well handled—they represented various types of chronic pulmonary infections which could not be specifically treated and which needed rest and general building up. Thus they received, albeit under the aegis of a faulty diagnosis, they improved and

the vast majority recovered. Another group, misdiagnosed and mistreated, went the way of all flesh because of our incapacity to properly evaluate the presenting symptomatology.

Four factors are responsible for the present increasing accuracy in the diagnosis of lung diseases. They are:

- 1 A far better appreciation and interpretation of x-ray findings, dependent upon (a) Vastly improved technic in the taking of films, (b) The result of experience in reading films, together with the information given at the necropsy table.

- 2 Bronchoscopy, which yields wonderful results in skilled hands.

- 3 Lipiodol injections, which map out lung areas hitherto a trackless wilderness to the clinician.

- 4 More exact methods of sputum examination and culture, resulting in the recognition of formerly unsuspected sources of chronic pulmonary infection.

In any case presenting symptoms referable to the respiratory tract, namely cough, sputum, hemoptysis, dyspnea, together with slight or marked constitutional manifestations, the following are the chief possibilities to bear in mind:

- 1 Pulmonary tuberculosis (always first and foremost)

- 2 Bronchiectasis

- 3 Pulmonary abscess

- 4 Pulmonary fibrosis

- 5 Pulmonary neoplasm

- 6 Mycotic disease.

- 7 Spirochetosis

- 8 Occupational diseases (Silicosis, asbestosis, and anthracosis)

- 9 Pulmonary syphilis

In many cases of pulmonary disease,

answers to questions, the young mother will find this book full of practical information—all she needs. It is a much better book than many others this reviewer has seen. The doctor may well recommend it to his patient.

CHARLES A. GORDON

A Textbook of Medicine By Charles P. Emerson, M.D. Quarto of 1296 pages. Philadelphia, J. B. Lippincott Company, 1936. Cloth, \$8.00.

To review the first edition of a Textbook of Medicine with one name as its author, is a task which one approaches with expectancy not unmingled with awe. It is a tremendous piece of work requiring courage and optimism for its undertaking.

The first problem the author has to face is whether there is need for such a book, if it is written along the same plan as those now in use, then certainly it is superfluous. The author attempts to avoid this by offering "several unique features." The "plan is to present Internal Medicine in terms of the clinical pictures of diseases and to explain these by the findings of Pathology, Bio-chemistry and the other pre-clinical sciences, rather than to emphasize the latter."

To bring to the notice of the student that medicine is largely an art, room is provided for giving the historic development of many important discoveries as well as brief biographies of familiar names in medicine. Furthermore, stress is placed on the interpretation of symptoms as evidence of expression of the defensive forces of the body. And lastly, that Bacteriology, Bio-chemistry and abnormal Physiology are not all the factors which determine the course and severity of disease, but very important also are the emotional reactions as well as information obtained by an inquiry into the past, the family and other environmental factors. All this is most commendable, and yet as these features are observed in the text, it doesn't impress the reviewer that in this respect there is a very appreciable difference from other text books. On the contrary, the subordination, in volume as well as in type, of the Morbid Anatomy tends to defeat the efforts of teachers in medicine to impress the student with the importance of this phase of disease.

It is admitted that the classification of disease is most difficult and unsatisfactory no matter from what angle it is approached, so that "many authors have attempted no classification whatever." Here, the diseases are divided into twenty parts beginning with one part headed "Specific Infectious diseases and ending with part twenty treating of Psychoneurotic Dis-

orders." While arbitrary, this classification is of use to the student who can thus readily locate a disease and at a glance observe its relation to allied conditions.

While it is true that Typhoid Fever is not as common a disease as a generation ago, detailed study of it has always served as a model on which was based the consideration of other classical diseases. Most authors still consider it such for they devote from thirty-three to twenty-two pages as against fifteen in this book. Also it is noted that the Pathology of the disease is treated in other texts in one or two pages, while here it is given in twelve lines. In a discussion of Acute Laryngitis (Page 605) it is questionable if the treatment of this condition is a problem for the specialist. It is not so disposed of in other texts. The Pathology of Gonococcus Infections surely deserves a more serious discussion. In the first edition it is to be expected that a few typographical errors creep in, such as on page 630 Chronic "Intestinal" Pneumonia. Most likely "Interstitial" is meant. Then, in note 12, page 267, first line, the word "valve" appears instead of "value."

The impression is left, after a rather extensive review of the book, that the future text-book of Medicine must be one in which a number of contributors, specialists in their line, must collaborate, perhaps not to the extent that characterizes Cecil, 3rd edition (1933) which contains the names of 140 contributors, and yet the number must be sufficient to divide the responsibility and add to the authoritativeness of the enterprise. The task for one is well-nigh impossible, no matter how very praiseworthy the effort.

SIMON R. BLATTEIS

Surgery for Dental Students By Philip H. Mitchner, M.D., Clement E. Shattock, M.D., Edward G. Slesinger, M.S. & Cecil P. G. Wakeley, D.Sc. Octavo of 364 pages, illustrated. Baltimore, William Wood & Company, 1936. Cloth, \$4.75.

This book is exactly what the title implies, a textbook for dental students, carrying them through general surgical pathology, surgical infections and through all surgical matters, with special reference to those of interest to the practitioner or student of dentistry.

The work, while comprehensive, is decidedly written as a textbook covering the syllabus in surgery and surgical pathology of the Royal College of Surgeons of England, Scotland and Ireland, and of Universities of the British Empire.

It is the reviewer's opinion, that the book is carefully prepared, modern, and lives up to its purpose.

LAWRENCE J. DUNN

present Sixty-six per cent of lung abscesses develop after either surgical procedures or pneumonia. The onset is usually very acute and the patient is exceedingly ill. I have never seen a class of patients more acutely sick, and recover, than those the victims of pulmonary abscess prior to the breaking through into a bronchus and the consequent discharge of pus, thus changing the acute into the subacute abscess which in turn, fortunately frequently becomes chronic, when certain curative surgical procedures are of inestimable value.

David T Smith (quoted by Emerson), in a review of the etiological factors in 1212 cases of pulmonary abscess, gives the following figures

- 338 (28%) after tonsillectomy
- 188 (15%) after other operative procedures
- 77 (23%) after pneumonia
- 138 (11.5%) developed insidiously
- 18 (1.5%) Aspiration of foreign body
- 161 (13.5%) Miscellaneous causes (details not stated)
- 92 (7.5%) Cause unknown

The physical signs of pulmonary abscess are wholly without characterization. The x-ray picture is also protean. Diagnosis is essentially based on previous history, acuteness of onset, signs and x-ray evidences wherever they may be, a constant leukocytosis and, finally, the liberation of a varying amount of foul-smelling pus when the abscess ruptures into a bronchus. A point worth stressing is the extreme degree of illness in cases of pulmonary abscess, their marked toxicity far exceeding that of all save the most unusual cases of pulmonary tuberculosis. With the so-called "pointing" of the abscess, the diagnosis is self-evident. If the abscess does not drain spontaneously, the patient is apt to die from the overwhelming toxemia, for it is practically axiomatic among thoracic surgeons never to operate upon a pulmonary abscess in the acute stage.

Pulmonary fibrosis is a condition which has been but recently recognized as a definite clinical entity, leaving out those strictly occupational diseases, such as anthracosis, silicosis, and asbestosis, with

which we will not deal. Hampton² states that "on x-ray the pulmonary changes are quite similar to those associated with tuberculosis, but tuberculosis is more localized and less likely to involve entire lung fields." The physical signs of pulmonary fibrosis are notoriously insistent and no reliance can be placed on them. Very frequently pulmonary fibrosis is accompanied by emphysema, which in itself greatly masks all physical signs. Clinically the most characteristic symptom of fibrosis is *dyspnea*—but he would be a bold man who would hazard a fibrotic diagnosis on that symptom alone.

Hamman³ has reported four cases of acute pulmonary fibrosis occurring on the medical service of Johns Hopkins Hospital, all of them presenting symptoms of extreme cardiorespiratory failure, all of them dying and all of them coming to necropsy. His paper is too lengthy to abstract, but his summary may be given in part

From the pathological anatomy and the symptoms of these four patients we may reconstruct the course of an uncommon and remarkable disease. Pulmonary inflammation develops insidiously with little local or constitutional disturbance. Very shortly after the onset of pulmonary infection there occurs a marked proliferation of connective tissue which greatly thickens the alveolar walls and obliterates many of the air sacs and soon dyspnea comes on and grows increasingly severe as a result of the fibrosis which disturbs the relation of the alveolar capillaries to the air spaces and encroaches upon the alveoli themselves. At an early stage of the disease the exudate may be so extensive throughout all lobes of both lungs that acute suffocation occurs. At a later stage, as happened in two of our cases, the patient may die of slowly progressive suffocation. As pulmonary fibrosis increases and spreads, the circulation in the lungs is impeded, the pressure in the pulmonary artery is increased, and soon the right ventricle becomes dilated and hypertrophied. As the pressure in the pulmonary circulation steadily rises, a constantly increasing burden of work is thrown upon the right side of the heart. Soon or late the symptoms of congestive heart failure appear and steadily advance until death occurs from myocardial insufficiency.

These cases of acute pulmonary fibrosis are probably of more frequent incidence than we wot of. It would be well

the carefully taken history in itself almost confirms or excludes the presence of tuberculosis. Time prohibits entering upon the details of this question, but all who have taken several hundred histories in pulmonary cases will, I am sure, bear me out in this assertion. In my own experience I know that upon completion of the history I have (it may be that I am guilty of an *a priori* judgment) a very definite idea in my own mind as to whether the patient is suffering from a tuberculous or a nontuberculous lung affection. It may be the result of experience, it may be a guess, it may be a "hunch"—but nevertheless it is there and it very rarely lets me down. I do not mean to intimate that I allow my diagnosis to rest upon the history—but history plays an enormous role in the differential diagnosis of tuberculous and nontuberculous disease.

Trite though it may seem to repeat a statement which is practically axiomatic, let it be stated at the outset that physical signs (by which I mean rales) found in the lower lobes are to be considered as nontuberculous until proved otherwise, and that physical signs found in the apices are to be considered as evidence of tuberculosis until proved to be of other origin. Again, let me reiterate another truism: if a patient has a moderate or considerable amount of thick, yellow, yellowish green or green sputum and if on *repeated* examinations that sputum is found to be consistently negative for tubercle bacilli, the probabilities are all against the presence of tuberculosis.

If the two categorical statements just made are borne in mind and adhered to, a faulty diagnosis of tuberculosis will ere long become a rarity.

Bronchiectasis is a condition that is widespread and which in many instances is incorrectly diagnosed as tuberculosis. The textbook presentation of the condition differs vastly from that found in actual practice. No mistake in diagnosis will be made in the case of the patient with 250 to 500 c c of sputum in twenty-four hours, the sputum separating into three layers, the absence of tubercle bacilli, the basal physical signs, the relatively slight constitutional manifestations, the x-ray findings, particularly when reinforced by lipiodol injections. But these

are the so-called "classical" cases—they practically diagnose themselves. Far different are the milder evidences of the disease, when cough and sputum are not predominant, when physical signs are scant or absent, and when no characteristic finger clubbing exists. Then it is that the condition is most confounded with tuberculosis. The two conditions may, of course, coexist, but when they do the diagnosis of tuberculosis is usually obvious.

Emerson¹ says

Bronchiectasis is rarely seen in the upper lobes and when it does occur there is usually associated with tuberculosis. The dilated bronchi may indefinitely retain their integrity, or ulceration of the bronchial wall may be followed by perforation and abscess formation in the peribronchial tissue. On the other hand, bronchiectasis may follow abscess formation and in time overshadow the original lesion. Bronchopneumonic suppuration aptly describes lesions of this type.

Furthermore, in bronchiectasis the constitutional symptoms over a long period of time are slight as compared with the exacerbations and increasing toxemia of tuberculosis. Given, therefore, a condition of long-standing with chronic cough and sputum, the latter negative for tubercle bacilli, with relatively few constitutional symptoms, the verdict should be bronchiectasis rather than tuberculosis.

I had occasion some months ago to examine a man of fifty-five, six feet four in height and weighing two hundred and sixty-four pounds, who, over a period of four years every night expectorated 500 c c of purulent sputum. His general health was absolutely unimpaired, he did his work without undue fatigue, there were but a few rales at the base of the right lung, but the x-ray showed greatly dilated bronchi leading to the right lower lobe. I did not have an opportunity to do a lung-mapping on him as his stay in Asheville was too short, but his sputum had been repeatedly examined for tubercle bacilli and had always been negative. This was obviously a case of bronchiectasis.

Lung abscess is a condition that should readily be differentiated from tuberculosis, and yet many and many a time have I had patients referred as tuberculous when as a matter of fact abscess was

the mind of the clinician. It is important not to miss these cases as the treatment is wholly different from that instituted in tuberculosis.

There is no doubt in my mind, as well as in the minds of others, notably Fischel,⁴ that the human organism is reacting differently to the tubercle bacillus than it did of yore. By this I mean that nowadays we see far more acute onsets, with temperature from 102 to 104° F, with severe toxemia and great prostration. Of course, the insidious onsets still exist but they are not as frequent as heretofore. All too often the patient says that he had "influenza" and was in bed from four to six weeks before the temperature subsided to between 99 and 100° F. I do not see these cases at their beginning. My information is derived from the history. We all know, however, that influenza does not incapacitate for a month or six weeks, that, uncomplicated, it is a disease of short duration. I am convinced that these long-drawn-out cases of "influenza" are in reality acute onsets of pulmonary tuberculosis and should be recognized as such. It still is a matter of astonishment to me how much time is often lost before an x-ray is taken and how long a period elapses before a sputum examination is made. Both are laboratory tests of such simplicity and of such negligible expense that failure to have them done does not redound to the credit of the attending physician.

As previously stated, it is not proposed to dwell here upon asbestosis, silicosis, and anthracosis. All three of them represent forms of chronic pulmonary fibrosis, but also all three of them are strictly occupational diseases and the history should give this information and hence the key to the diagnosis. X-ray and physical examination are not conclusive in the absence of knowledge of the mode of life and occupation of the patient.

Pulmonary syphilis is a very rare condition. I have never seen a proven case. Many years ago I remember a patient with apical rales and a 4+ Wassermann who was given specific treatment under which the apical rales and the accompanying cough and sputum disappeared. I presume that this was a case of pulmonary syphilis but definite proof is ab-

sent. Pulmonary gummata have been described and also areas resembling bronchopneumonic patches near the lung hilus which disappeared under treatment in a patient with a definite diagnosis of syphilis. While the condition may, and doubtless does, occur, we need not spend sleepless nights wondering whether our patient has pulmonary lues or not.

Hitherto no mention has been made of the value of the intradermal or Mantoux tuberculin test. A positive test simply reveals allergy to tubercle and confirms the pre-existence of a tuberculous infection, but by no means clinches a diagnosis of tuberculous disease. This rule holds good after the second or third year. Prior to that age, a definitely positive test, coupled with whatever symptoms may be present, is valuable evidence of existing active disease.

It has been thought until comparatively recently that practically all adults reacted positively to the intradermal test, this attitude being based on the old German phrase "Jederman hat am ende bei sich ein bischen Tuberkulose"—eventually everybody has a little tuberculosis. Thus, however, can no longer be held as an actual fact. I find quite a considerable number of adults that react negatively to the test, and a survey at Framingham, Mass., in 1926, showed a lessening of twenty-three per cent in skin reactions as compared to the survey of 1917. So it would seem that while, as pointed out previously, more human beings are reacting violently to initial tuberculous disease, at the same time a larger number are developing a greater natural immunity to tuberculous infection.

One could go on almost *ad infinitum* in the study of differential factors in pulmonary disease. To do so, however, would but serve to obscure the picture. Therefore, to summarize, what must be kept chiefly in mind? I have thirteen points and for once I will be rather dogmatic.

- 1 Pulmonary tuberculosis must constantly be kept in the foreground

- 2 Good stereoscopic x-ray films are essential in diagnosis

- 3 Failure to examine sputum is equal to malpractice

- 4 Failure to find tubercle bacilli after

for all of us to be on the lookout for them and not to ascribe certain obscure deaths to an unlocalized bronchopneumonia or merely to myocardial failure. Dr Hamman's cases also show how valuable is the necropsy and how zealous we should be to secure one in all cases the evolution of which is not perfectly plain.

Cancer of the Lung

Primary pulmonary carcinoma is practically always bronchogenic. When we come to deal with metastatic pulmonary malignancy, the diagnosis rests upon respiratory symptoms superimposed upon a known cancerous base.

The main symptoms of pulmonary malignancy are pain, dyspnea, x-ray findings of an heterogeneous nature with rapid spread, added to which there is the constantly increasing cachexia characteristic of malignant disease wherever situated. Most characteristic is a dyspnea out of all proportion to the anatomical damage as revealed by physical examination or x-ray. Again, the often voluminous sputum is relatively benign in appearance and, of course, persistently negative for tubercle bacilli. Physical signs are practically of no diagnostic value. Emerson wisely says "All obscure cases, particularly those with lesions of the lower lobes, with more or less indefinite symptoms and negative sputum, should be bronchoscoped and lipiodol films made *before* subjecting the patient to a long and tedious period of observation."

I would like unequivocally to endorse this statement. I do feel that in patients definitely ill, all too frequently valuable time is lost by keeping the individual "under observation." There are certain things that can be done. Therefore, why delay? I do not here refer to the patient but slightly ailing, with a temperature of 99.2 to 99.6° F with few or no respiratory symptoms and practically no physical signs. We all see those patients and they cause us lots of worry because we cannot put our diagnostic finger on any one thing. The patient I have in mind is the one that is obviously sick. In this class of cases there is no reason for procrastination. The sooner the patient is investigated bronchoscopically or lipiodolly (pardon the coined word), the better.

Pulmonary Bleeding

With our greater knowledge of intrapulmonary conditions there has, of course, come about a more liberal interpretation of hemoptysis which, twenty-five years ago, was unquestionably and unhesitatingly assumed to be *prima facie* evidence of tuberculosis. We know better now, and yet the very fact that we do know better has tended to becloud the significance of pulmonary bleeding. It must still be maintained that by far the greater number of hemoptyses are due to tuberculosis. Some are due to bronchiectasis, some, mixed with pus, to lung abscesses, many to cardiac pathology, and there are a few whose origin is undiscoverable. I had such an individual a year or so ago—a man having repeated and severe hemoptyses from the right lung, no tubercle bacilli ever to be found, general condition excellent. He was bronchoscoped by Dr Hart of Charlotte, N. C., who could see the bleeding point but could not close it. Examinations of secretions taken bronchoscopically were absolutely negative for all organisms. Artificial pneumothorax was induced and under compression the bleeding stopped and has not recurred in months. The pneumothorax is being continued and the man is in excellent condition and working full time. This is a case of bleeding of unknown origin. These cases are rare, but they do occur and it is wrong to diagnose all cases of hemoptysis as being of tuberculous origin and therefore subjecting them to the lengthy and expensive cure necessary for recovery from that disease.

Reference can be made to other pulmonary conditions that are often diagnosed as tuberculosis. Aspergillosis is one. The x-ray and the physical signs may be practically identical with those found in true infection with tubercle, but the persistently negative sputum is a great argument against tuberculosis, and the finding of the characteristic fungus when the sputum is cultured on Sabouraud's medium clinches the diagnosis. The same general truths hold true for spirochetosis and the diagnosis hinges not so much on clinical features as on accurate laboratory examinations. Of course, the possibility of these conditions must be in

DIAGNOSIS OF SURGICAL JAUNDICE

REUBEN OTTENBERG, M D, and RALPH COLP, M D, *New York City*

From the Mount Sinai Hospital

In the last three years we have been especially interested in jaundice. Through the courtesy of our colleagues we have been able to see three hundred and fifty cases, from which we have selected eighty-four for analysis in which the diagnosis was either proven by operation, autopsy or subsequent course. Half of these were "medical jaundice," the other forty-two were "surgical jaundice" consisting of twenty six cases of stone and sixteen cases of carcinoma obstructing the common bile-duct. All the cases presented jaundice of recent date. For our own satisfaction we have reviewed the records of these cases to determine what points in history, physical examination, and laboratory study were of real help in reaching a diagnosis.

I History

The following five points in the patient's history were selected for consideration: (1) pain, (2) itching, (3) chill at onset, (4) history of previous attacks of pain or jaundice, and (5) history of use of hepatotoxic substances or exposure to infectious types of jaundice.

Pain Of the twenty-six cases of common duct obstruction due to stone there was only one that did not have upper abdominal pain. The majority complained of pain which was rather typical of gall-bladder colic, with the usual radiation to the scapula or along the costal margin.

Our cases of carcinoma of the common bile-duct contradict the usual statement that the jaundice is characteristically unassociated with abdominal pain. Eight of the sixteen patients with carcinoma complained of pain at the time of onset of the jaundice. In four of these the pain simulated gall-stone colic. In four others, it was less sharply defined but was abdominal, for the most part right-sided and could have been misleading if over-emphasized.

Pain occurred in eighteen of the forty-two cases of hepatitis, and in nine of them it was either epigastric or localized in the right upper quadrant. In some it simulated mild gall-bladder colic.

It is evident that pain by itself is not a deciding symptom. When severe it favors the diagnosis of stone but it does not exclude the diagnosis of either carcinoma or hepatitis.

Pruritus Pruritus is a symptom of little significance. It occurs about as frequently in each of the three groups considered. Thus in twenty-six cases of stone it occurred in ten, in sixteen carcinoma cases it occurred in nine, and in forty-two hepatitis cases it occurred in sixteen.

Chills Chills do not often occur. They were mainly characteristic of the calculus cases, occurring at the beginning in four of the twenty-six cases. There was only one chill at the onset among the forty-two cases of hepatitis and none among the sixteen cases of carcinoma, although two gave a history of chilly sensations. This symptom, when present, is of diagnostic value.

Previous Attacks of Pain or Digestive Disturbance Twenty-three of the twenty-six cases of obstructing calculus presented such a history. Only three of the sixteen cases of carcinoma, and four of the forty-two cases of hepatitis, gave a definite history of antecedent episodes of abdominal discomfort. This finding thus is of differential value.

History of Exposure to Toxic Substances or to Infectious Jaundice Among the cases of hepatitis, histories of toxic substances were obtained in eleven cases: one case followed salvarsan therapy, one followed cinchophen therapy, one followed novatophan therapy, three followed hypertonic saline injections, three followed liver extract intramuscularly, and two followed alcoholic bouts.

Hypertonic saline intravenously for

Read at a combined meeting of the New York Academy of Medicine and the New York Gastroenterological Society, November 17, 1936

repeated attempts is a great argument against the presence of tuberculosis

5 In *all* children under twelve and in *all uncertain* adult cases an intradermal tuberculin test should be done. Lots of adults will react negatively and that throws out tuberculosis

6 A carefully taken history is of great importance. It need not be long. Quality is away above quantity. Do not leave this to an assistant. Do it yourself

7 Resort promptly to bronchoscopy and lung mapping in all doubtful cases that are really ill

8 Remember that persistent absence of tubercle bacilli from sputum merely *excludes tuberculosis*. The patient is not a bit better than before. Continue to search the sputum for some definite cause of infection

9 The ravages of bronchiectasis are almost never like those of tuberculosis unless they coexist, and then tuberculosis is the primary disease to be treated

10 Hemoptysis is not pathognomonic of tuberculosis

11 An extremely acute postoperative pulmonary symptomatology should direct the diagnostic finger toward abscess

12 Fibrotic conditions arise in the presence of chronic sinusitis and other chronic infections elsewhere in the body. There may be acute fibrotic pulmonary conditions. Think of them

13 Pulmonary malignancy is on the increase. In the primary type bronchoscopy is invaluable diagnostically. In the metastatic type the diagnosis is of scientific interest only

The lungs present a multiplicity of chronic diseases differing in origin, in symptomatology, in pathology, and in treatment. We have traveled far since Hippocrates uttered his famous aphorism "From a spitting of blood there comes a spitting of pus." That aphorism holds as true today as upon its primal utterance. But into what diagnostic labyrinths has that blood and that pus led us! With our increasing knowledge comes also increasing doubt, with increasing doubt, increasing curiosity, with increasing curiosity, increasing investigation, and with increasing investigation, increasing discovery

Yet, though we are far from the top of the hill, most certainly we are on our way and with deeper delving into the half-hidden mysteries of ourselves and our environment, we come to realize more and more the deep wisdom contained in that other aphorism of the Father of Medicine that most appeals to me and which I love to quote

"Life is short and the art long,
the occasion fleeting, experience fallacious and judgment difficult"

CANCER QUACKS BUSIER THAN EVER

Explaining that cancer "cures" and "preventives" recently have been "boldly and subtly exploited," the Executive Committee of the American Society for the Control of Cancer issues a statement declaring that early and accurate diagnosis and prompt treatment by surgery, radium or x-ray offer "the only present hope of cure."

The committee warns the public against relying for cancer therapy on "glandular substances," "secret chemical formulae," "antitoxins" or "diet." Dr. C. C. Little, managing director of the society, said all these "methods" of cure had been found valueless.

"With the extension of the cancer problem to include the fields of biology, chemistry and physics, as well as its former terrain within the practice of the medical pro-

fession, new dangers have arisen," the society's statement said.

"These dangers are the wide and varied assortment of 'cures' and 'preventives' claimed by a number of individuals in many parts of the world. At no other time have these 'cures' been so boldly and subtly exploited.

"The amount of scientific training and of honest conviction in the value of their work, possessed by the persons making these claims, undoubtedly varies. There is, however, a mechanism by which these cures can be tested without detracting from the credit of the discoverer. This is by asking cancer research laboratories and leading medical schools to evaluate the discovery in the same way that insulin was introduced to the public."

The galactose tolerance test was negative. (This, however, is quite usual in cases of subsiding hepatitis.) Her stools were normal. The right upper quadrant tenderness gradually receded. A diagnosis of simple jaundice was made at discharge.

Eight months later she was readmitted. She had been well until four days before admission when she began to have severe epigastric pain which radiated to the right upper quadrant. This was followed by vomiting and jaundice. The temperature rose with a shaking chill shortly before admission.

There was definite tenderness in the epigastrium and right upper quadrant. The temperature was 102°. The urine contained a faint trace of bile and urobilin in normal amounts. The blood cholesterol was 155 mg and cholesterol ester forty-two mg. At this time the patient was considered to have had a mild cholecystitis and it was thought the attack might subside. However, it did not.

Operation disclosed several faceted stones in the gall-bladder while the common duct, which was dilated to about three times normal, contained thirty-five to forty very small biliary calculi.

Comment This case emphasized the fact that the common duct may be filled with stones and yet no icterus or pain be present for long periods of time. While simple jaundice is a disease which affects the young (in whom gall-bladder disease is rare), one must consider the possibility of calculus in spite of the youth of a patient.

II Physical Findings

The physical examination was of some, though not of great importance. The spleen was palpable in a far greater proportion of hepatitis cases than in the other two diseases (seventeen cases of hepatitis, three of carcinoma, two calculus cases). While the liver was generally enlarged in the cases of hepatitis (thirty-one of the forty-two), it was enlarged in eighteen of the twenty-six cases of calculus disease, and in nine of the sixteen cases of carcinoma. Hepatic enlargement is of little help in diagnosis.

Courvoisier's rule that the presence of an enlarged non-tender gall-bladder with jaundice is indicative of obstruction due to carcinoma rather than to stone, did not hold in this series. The gall-bladder was palpable in five cases of calculus disease, in only three of carcinoma of the biliary tract, and in two of hepatitis. A probable

explanation of this failure is as follows: cholecystitis is a frequent disease and thus may be coincidental with the more rare carcinoma of the head of the pancreas and cause shrinkage of the gall-bladder. Or the liver may be so much enlarged as to prevent palpation of an underlying distended gall-bladder. On the other hand a Courvoisier gall-bladder may be simulated either by hydrops of the gall-bladder due to occlusion of the cystic duct by stone, or by an abnormal projection of the liver edge (Riedel's lobe) or a ptosed kidney.

Localized abdominal rigidity was present in five cases of calculus disease, three of carcinoma, and in none of acute hepatitis. We infer that the presence of rigidity is opposed to the diagnosis of acute hepatitis.

Fever Over a third of our calculus cases presented fever at the onset. Only two of the carcinoma cases and one of the hepatitis cases did so. The presence of fever favors the diagnosis of calculus obstruction.

III Laboratory Findings

Galactose Test Of the so-called "liver function tests," the one which has proved to be of the greatest value is the galactose tolerance test of Bauer. Unfortunately the test was not done in all the cases of obstructed duct because in many of them the diagnosis was fairly certain on other grounds, and it was not thought justifiable to postpone operation in order to make laboratory studies. In seven cases of gall-stone obstruction all the tests were negative. Two of the five done in cases of obstruction due to carcinoma were positive. However, one of these patients was tested at a time when jaundice had been evident for about three months and the other when it had lasted for over three weeks. It is well-known that prolonged obstruction causes parenchymatous liver damage. Of the thirty-six tests done in cases of hepatitis, fifteen gave a positive result. Most of these were done rather early in the course of the disease. A positive test fairly early in the course of jaundice therefore points strongly to hepatic degeneration.

Hippuric acid test The new hippuric acid synthesis test of liver function origi-

thromboangitis and liver extract injections intramuscularly, have never before been reported as causes of liver degeneration but we have seen seven cases following hypertonic saline and nine cases following liver extract injections. These cases will be described elsewhere by other members of the hospital staff. One of these cases has been published by Elitzik.¹

Two of the cases of simple ("Catarhal") jaundice were easily identified because they came from a public institution in which there was an epidemic of simple jaundice.

In thirteen then, of the forty-two cases of hepatic degeneration some definite history of etiological factors was obtained.

While exposure to toxic substances or some infectious form of jaundice favors the diagnosis of hepatitis, just as the history of previous attacks of pain and indigestion favors the diagnosis of calculus, the history alone may be misleading. A person with biliary obstruction may have recently received some toxic substance without the latter necessarily having injured his liver, or gall-stones may be merely incidental in liver degeneration. Thus consider the following two cases (which because of the doubt in diagnosis are not included in our statistics).

A.M., thirty-eight year old Porto Rican male, was admitted to the hospital because of a deep progressive icterus associated with anorexia and dizziness of two weeks duration. With the onset of jaundice two weeks before admission, the stools became light and the urine dark. There was no pain. He had received antiluetic therapy intravenously for the past two years. The last intravenous injection was received six weeks before the onset of jaundice.

The liver was enlarged to four cm. below the costal margin. The spleen was palpable. The galactose tolerance test was negative. Duodenal drainage revealed slightly cloudy, whitish fluid. There were many white cells as well as epithelial cells present. The blood cholesterol was 160 mg., the cholesterol ester 50 mg., the icterus index 150.

The patient was given a high carbohydrate diet with intravenous glucose. He made a gradual recovery. The blood cholesterol rose to 230 mg. and the cholesterol ester to 115. The icterus index fell to eight-five and then to forty-five. The stools were normal. The urine contained large amounts of bile and no urobilin,

and cleared before discharge. This patient was considered to be a characteristic case of salvarsan hepatitis.

About a year later he was readmitted and stated that he had remained well until four days before admission when he suddenly developed severe right upper quadrant pain which later radiated across the epigastrium to the left lower quadrant. This was followed by nausea and vomiting.

He appeared acutely ill and in great pain, and had severe direct and rebound tenderness and rigidity in the epigastrium in which a vague mass was felt. His temperature was 102, pulse eighty-six. The intra-abdominal process apparently subsided, the temperature fell to normal, and five days after admission, he seemed well. X-rays revealed the presence of small stones within the gall-bladder. Exploratory laparotomy was then performed and chronic cholecystitis with cholelithiasis was found. The common duct was free of calculus.

Comment. It is possible that the patient suffered from two separate conditions at a year's interval. However, in view of the subsequent cholelithiasis, there may be some doubt as to whether the attack of jaundice in the previous year was really arsphenamine hepatitis, or was due to a silent stone in the common duct.

V.V., an Italian girl of sixteen presents another instance in which the probable erroneous diagnosis of jaundice was made in the first attack because of the extreme youth of the patient, and the palpable spleen. She was admitted with a two and a half week's history of severe recurring epigastric pain, relieved by vomiting. The pain returned two days before admission and radiated to the right upper quadrant. Three days preceding admission, she became constipated and had anorexia and acid eructations. A day later the pain recurred and a day before admission, the patient noted jaundice.

The liver was felt three cm. below the right costal margin where tenderness was present. The spleen was soft and just palpable. During her stay in the hospital her temperature remained below 100° with the exception of one unexplained rise to 102. The urine was found to contain no bile and only traces of urobilin. The icteric index was seventeen with a quantitative van den Bergh of 0.4 mg. The blood cholesterol was 200 mg. total with fifty-five mg. of ester.

It was thought that the patient was suffering from hepatitis. She was given a high carbohydrate diet. The cholesterol figures rose slowly. On discharge the cholesterol was 300 mg. total with ester of 155 mg.

Low figures for cholesterol ester when determined in jaundice point to liver parenchyma damage. This fact must be evaluated in considering the prognosis of surgical intervention in cases which on other grounds are thought to be obstructive.

Duodenal Contents Duodenal drainage is often thought to be a help in establishing differential diagnosis between the three conditions. Bile was present in seven of the eleven drainages done in cholelithiasis cases, in one of the six aspirations in carcinoma cases, and in all the twenty hepatitis cases. The complete absence of bile in the duodenal contents suggests complete obstruction and usually carcinoma. However, it must be remembered that if hepatitis cases are carefully followed, there are occasionally periods of several days in which urobilin is completely absent from the urine and feces. If duodenal contents is aspirated during this interval, bile is absent.

The significance of ferments is debatable and the ferment examinations in our cases were only confusing. Even though a complete obstruction may be present at the choledochus and the duct of Wirsung, ferments may still be found if the duct of Santorini is patent.

Cholesterol crystals and pus cells if found, are thought to indicate cholelithiasis. Cholesterol crystals were present in five of eleven calculus obstructions, in one of six cases of carcinoma of the head of the pancreas, and in three of the twenty-six cases of hepatitis. The presence of crystals at best is more suggestive of cholelithiasis than of carcinoma or hepatitis. In the one case of obstruction due to carcinoma in which crystals, pus, and bile were found, the gall-bladder was free of disease and calculi.

X-rays The use of the dye method for visualization of the gall-bladder is of little value in the presence of jaundice. In calculus obstruction of the common bile duct, seventeen cases were x-rayed without dye and three showed radio-opaque stones. In thirteen cases of carcinomatous obstruction, none showed stones. It is worthwhile, therefore, in doubtful cases to have a "flat plate" of the abdomen in the hope of detecting a radio-opaque stone. Shadows present must, however, be interpreted with great

caution as is illustrated by one of our cases (not included in the statistical summary because of doubt as to the diagnosis).

A E., a fifty year old male, gave a history of postprandial distress for fifteen years. The present attack of illness consisted of painless, progressive jaundice with clay-colored stools, pruritus, nausea, and occasional vomiting for three months.

Duodenal drainage showed the presence of bile and the absence of pus and crystals. The stool, though white in color, did show some urobilin. The blood cholesterol was high, 420 mg, with cholesterol ester 100. The Takata-Ara test and galactose test were negative. The urine did not show tyrosin. The hippuric acid test was normal. A flat plate of the abdomen showed a large calcific shadow in the right upper quadrant which was thought to be a large gall-stone.

The patient was kept under observation. The icterus gradually subsided. After it had completely cleared, a gall-bladder visualization was done. The gall-bladder was normal and the shadow previously noted was found to be extrabiliary.

Operative Findings

Some of the incidental operative findings were significant. Fortunately no cases of hepatitis were subjected to operation. In twenty-six cases of calculus obstruction of the common bile-duct, nineteen revealed cholecystitis, one biliary cirrhosis, and three cholangitis.

In the sixteen carcinoma cases, four involved the common bile-duct, one the hepatic duct, two the cystic duct, and nine the head of the pancreas. In this small series, there were seven deaths, while in the twenty-six cases of common duct stone, there were four deaths.

Especially Difficult Cases

Besides the tabulated cases of jaundice in which diagnosis was practically certain, there were a number of cases which presented peculiar diagnostic difficulties. It is especially instructive to point out the source of confusion in some of these cases.

S R., a male of forty-five years of age had received numerous injections of hypertonic saline solution for thromboangitis obliterans. Following one of these injections he developed rather severe jaundice. The onset was without pain or fever and at

nated by Quick² has been studied in the past year at our hospital by Dr Doubillet. This examination which promises to be at least of equal value to the galactose test is very simple*. Of the Quick tests in twenty-three cases of hepatitis, fourteen were definitely positive, *i.e.*, less than three grams were excreted, in six more were border-line results, three to four grams of hippuric acid having been excreted. This new test has not yet been tried in a sufficient number of control cases of obstruction. However, if the control cases already published are a criterion, the test is valuable.

Tyrosinuria The presence of tyrosin in the urine was determined by the new method of Lichtman and Sobotka³ and under their supervision. Seven were reported positive in thirty examinations of acute hepatitis. Two were reported positive in seven cases of gall-stone obstruction. In one of these cases, the patient had had an obstructive jaundice for a month. In five tests in carcinoma cases, two also were reported positive. Of these one was a patient in which jaundice had been present for over three weeks. Lichtman recently suggested that the destruction of tissue in carcinoma may in itself produce tyrosin⁴. While tyrosinuria indicates liver damage, the test should be used in differential diagnosis only if the amount of tyrosin is large.

Takata Ara Test⁵ Another new clinical test is the Takata Ara precipitation test†. The three tests done in carcinoma cases were all negative. Of the seventeen tests in hepatitis cases, five were positive. The number of the tests is at present too small to permit conclusions.

Blood Cholesterol Much reliance has been placed upon the estimation of the cholesterol and cholesterol ester of the blood, which was a routine determination.

* Six grams of benzoic acid are administered to the patient. The excretion of hippuric acid in the urine is directly determined. Normal persons excrete over three grams within five hours.

† This is based upon the observation that in certain diseases, the patient's blood serum lacks a peculiar protective colloid and permits the precipitation of a special colloidal mercury solution. The technic of the test is simple, resembling in many ways the colloidal gold test in spinal fluid. A positive Takata-Ara reaction may occur in any febrile or inflammatory disease, but among the noninflammatory diseases, positive results occur chiefly in acute liver degeneration, hepatic cirrhosis, and nephrosis. Inasmuch as the last two diagnoses do not have to be considered in the current series, the results of these tests are of some significance.

Normal figures for blood cholesterol are assumed to be 200 to 250 mg per 100 c.c. of blood. The cholesterol ester is regarded as abnormally low when it is less than half the total cholesterol. In the presence of jaundice, high blood cholesterol generally points toward obstruction. Low cholesterol and especially low cholesterol esters point to liver degeneration.

Using these standards the following data were obtained:

	Cholesterol		Ester
	High	Low	Low
26 calculus cases	19	6	14
16 carcinoma cases	14		5
42 hepatitis cases	12	17	23

In all these cases, the blood tests referred to were obtained during the first week of the patient's stay when the question of diagnosis was particularly important. In Epstein's previous work⁶ in hepatitis cases in which he reported greater frequency of low figures for cholesterol and especially for cholesterol ester, the tests were done repeatedly throughout the course of the disease. It is important to know that during convalescence from hepatic degeneration, *i.e.*, during the regenerative stage, the blood cholesterol tends to increase above normal. On the contrary, after the relief of obstruction, blood cholesterol tends to drop toward normal. It is therefore important in interpreting cholesterol to know whether blood bilirubin is on the increase or on the decrease. The value of repeated determinations of cholesterol and blood bilirubin is evident.

Many cases of hepatitis, particularly the milder cases, and those due to salvarsan⁷ and to hypertonic saline solutions, show somewhat elevated cholesterol and cholesterol ester determination instead of the expected low figures. It is possible that in some of these cases the real mechanism of the jaundice is not hepatic cell degeneration but inflammation of the smallest bile ducts, cholangiolitis—hence the jaundice is truly obstructive.

The factors which we have found worth taking into consideration are

HISTORY Pains, chills, previous attacks, and ingestion of toxic substances

PHYSICAL FINDINGS Palpable spleen, local rigidity, and fever at onset

LABORATORY TESTS Galactose test, Hippuric acid test, Tyrosin in urine, Blood cholesterol, Blood cholesterol ester, Duodenal contents, and X-ray for radio-opaque calculi

With every one of these features it is only the unmistakable positive which can be evaluated. The absence of a symptom, sign or test has little or no significance. Its presence can only be said to add somewhat to the probability of the particular

one of the three conditions in which it is known to predominate percentually. With this understanding we can classify the features as in the accompanying table.

The stress of research in recent years has been on laboratory evidence of liver degeneration. From the surgical point of view what is most needed is a positive test for the existence of obstruction in the bile-duct. It is possible that this will be afforded by a method of x-ray visualization of the gall-bladder and bile-ducts which is applicable in the presence of jaundice and which has just been announced by Foote and Carr.⁸

FEVER THERAPY FOR GONORRHEA

Twenty-five physicians from leading medical centers in this country and abroad testified at the First International Fever Conference, at the Waldorf-Astoria Hotel, that they had found artificial fever to be a specific cure for gonorrhea in both men and women, according to a report in the *New York Times*.

The fever treatments, they reported, had resulted in speedy recoveries in both recent and chronic cases, including those which had failed to respond to treatment by chemicals. In only a small percentage of the patients, they found, had the treatment failed to yield effective results.

This marked the first occasion at which so many specialists from widely geographical points reported with practical unanimity on the subject.

The results were regarded by those present as of extreme importance, particularly to women, for whom the disease generally required months and years of treatment, with not infrequent serious surgical operations which made them invalids for life. Many of the cases were reported as "cured" by fever therapy in one day.

Professor Arthur Elmer Belt of the College of Medical Evangelists, Los Angeles and Dr Alvin William Folkenberg, also of Los Angeles, reported that a single ten-hour treatment at 106.8 degrees Fahrenheit cured fifty-nine out of sixty-four patients. The single fever session, they added,

worked essentially equally well in both acute and chronic cases.

The length of the treatment and the height of the temperature required, several of the physicians reported, depends on the "thermal death time" of the particular strain of bacteria infecting the patient. Some strains, it has been found by experiments, are more resistant to heat than others. Fortunately, however, it has been found that the virulence of the strain does not necessarily make it more resistant to heat than the less virulent strains.

The "thermal death time" is first determined by subjecting a specimen taken from the patient to heat outside the body. Experience has shown that the same temperature and the same length of time are sufficient to destroy the germs in the patient.

Professor Charles M Carpenter and Dr Ruth Boak of the University of Rochester School of Medicine said that for "the rational employment of artificially induced fever a knowledge of the thermal death time" of a particular strain of germs "is essential."

Dr Stafford L. Warren also of the Rochester School of Medicine, reported eighty-seven cures of one hundred cases. Ascertainment of the thermal death time, he said "is a practical guide in adjusting the length of the fever treatment to fit the needs of the individual patient."

first he was regarded as a typical instance of hepatic degeneration. However, he ran an unusually severe and prolonged course. The jaundice became very intense, urobilin was absent from the stools a large part of the time as well as from the urine. The blood cholesterol instead of being depressed, was normal or slightly elevated, 290 mg cholesterol, 140 mg cholesterol ester. The tyrosin test in the urine was negative on two occasions and the galactose tolerance test was normal. The duodenal drainage showed the absence of bile, although diastase and trypsin were present.

Because of all these features, the possibility of mechanical obstruction was given

and some of the findings were consistent with a common duct-stone which subsequently passed into the intestine, many of the features, particularly the low total cholesterol and ester, and repeatedly positive galactose tests, pointed to a degeneration of the liver.

The case of S R., a female sixty-two years old, illustrates the difficulty in making a positive diagnosis between a silent stone in the common-bile duct and a pancreatic neoplasm, and especially brings out the importance of surgical exploration in cases of obstructive jaundice.

Patient was admitted to the hospital complaining of jaundice of two months duration

TABLE I

HISTORY	<i>In favor of Calculus</i>	<i>Carcinoma</i>	<i>Hepatitis</i>
	Severe pain at onset Chills at onset Previous attacks of pain or indigestion	Age	Youth Use of toxic substances
PHYSICAL EXAMINATION	Local rigidity of abdomen Fever at onset		Palpable spleen
LABORATORY FINDINGS	Crystals (Cholesterol) in duodenal contents X-ray finding of calculi High blood cholesterol	Absence of bile from duodenal contents High blood cholesterol	Galactose test positive Hippuric acid test positive Abundant tyrosin in urine Low blood cholesterol Low blood cholesterol ester

serious consideration, and the patient was about to be surgically explored when the icterus commenced to diminish in intensity and he made a complete recovery in three months.

In retrospect, it seems that this was a case of hepatic degeneration. On account of some doubt as to the diagnosis, this and the following case were not included in our statistics.

M C was a sixty year old woman with a history of intolerance to fatty foods for many years.

Five weeks before admission she developed chilly sensations, vomiting, and jaundice, followed by clay-colored stools. There was some tenderness and spasticity in the right upper quadrant of the abdomen, and in the right trapezius muscle. There was a low grade fever. The blood cholesterol was low, 165 mg per 100 cc with cholesterol ester only fifty mg per 100 cc. Urobilin was present in the stools and duodenal drainage showed the presence of bile. The galactose tolerance test was positive, 59 grams excreted.

The jaundice gradually cleared up. A gall-bladder visualization was subsequently done. The organ was faintly visualized, and there was no evidence of stones. The gastrointestinal x-ray series were also negative. It was felt that while the history

which was accompanied by marked pruritus. Seven months before she had had a mild attack of epigastric pain. At no time in the present illness had she any pain nor had there been either chills or fever.

She looked very ill and jaundiced. The liver was felt four centimeters below the costal margin. The icteric index was forty-five. The stools showed complete absence of urobilin. It was thought that she was suffering from carcinoma of the head of the pancreas.

However, operation disclosed a chronically inflamed gall-bladder which contained stones, one of which had perforated into the common bile-duct causing complete obstruction. The liver showed gross evidence of biliary cirrhosis. The gall-bladder was removed and the common duct cleared of the calculus. She made an uneventful recovery.

Conclusions

There is no single symptom, sign or test on which reliance can be placed in the diagnosis of the cause of an attack of jaundice. In order to reach a decision one has to make a composite picture, assessing the importance of each of a number of features. Even then occasional errors are inevitable.

Fig 1 *Left*—Nasal hump and long tip *Right*—Nasal hump removed and nose shortened

thought of accompanying pain with the operation causes them to shrink away from it. Some of these eventually muster enough courage and seek an operation but some continually procrastinate out of sheer timidity.

When Jacques Joseph of Berlin introduced his endonasal approach in corrective nasal surgery in 1909, many objections were advanced denouncing his method. There are many reputable surgeons who believe the endonasal approach is more dangerous than the external incisional approach. If we may be permitted to judge the arguments advanced by the actual results obtained by many surgeons, the fears expressed against the endonasal approach would become unjustified. The opponents of the internal nasal incision state that the nasal cavity is exposed after the removal of a hump, hence making the fractured bones vulnerable to bacterial invasion. But they overlook the fact that the same is invariably obtained even in an external incisional approach no matter how much care they may take. Moreover, the high resistance of the mucous membrane of the nose to bacterial assault should dispel any fear of infection if the proper aseptic and antiseptic principles of medicine are scrupulously applied.

An infection following an endonasal approach is extremely rare and even if present, ordinary surgical procedure may readily arrest its progress.

In an endonasal approach method, we are not troubled with external skin scars which, no matter how negligible they may otherwise be, nevertheless detract from a more perfect esthetic result.

The use of chisels in rhinoplastic work seems to have many proponents. There is reason to believe a chisel is not as good as a saw. The force applied to the chisel can be transformed into the splintering of contiguous bones and not follow the directional course intended. Sometimes, the impact is translated into a fracture of the frontal bone. This is avoided by the use of saws which are placed securely in the position intended. The saws assure the operator of the desired direction of the fracture line.

In Fig 2 the lateral cartilages were superimposed and small strips of the alar cartilages were added to fill out the small saddle depression. The bones were left intact.

In Fig 4 the tip was raised by removing a triangular piece from the anterior part of the septum. The tip was also narrowed by cutting through the alar cartilage at its highest point.

CORRECTION OF NASAL DEFORMITIES

JOHN A. CINELLI, M D, *New York City*

The medical profession throughout the world is beginning to accept more favorably the reports on various rhinoplastic operations. As recently as a decade ago, most of the leading surgeons of the world spurned all efforts of the plastic surgeons to place their knowledge and ability on a proper footing with other specialties. Although the pioneers were looked upon with disdain by their colleagues, nevertheless their great confidence and persistency have blazed a new trail which today plays a major part in the drama of human lives.

Regrettably, this art of plastic surgery was mostly practiced by unscrupulous, quack doctors who reaped large fortunes at the expense of their often misinformed victims. The catastrophes which ensued at their hands placed this specialty in disrepute. But it was only with the obstinate persistency and confidence in this field by such great pioneers as Jacques Joseph of Berlin and J. Morestin in Paris that it began gradually to overcome the incredulity of the medical profession. Today, this art is being practiced by a great number of reputable surgeons throughout the world. It is almost unbelievable, and yet true, that the methods employed in nasal plastic operations today have been practically all devised by Joseph of Berlin. This astute surgeon even devised his own instruments which are being used by every surgeon doing this kind of work.

There was a reason why this subject had to come into being. From time immemorial there has been always a demand for esthetic perfection and men and women in every walk of life, in all the ages, have searched for the means to this end. It was only natural that the medical profession should seize upon this opportunity to apply its modern scientific basic antiseptic and aseptic principles to this field.

There are many factors which induce a person to apply for corrective rhinoplasty. The most important factor is psychological. The individual is at all

times conscious of his nasal deformity. He gradually develops an inferiority complex and dissociates himself from his fellow men preferring to be alone than to be what he believes the object of reproach and ridicule in their presence. He grossly exaggerates his plight in the society of men which he now desires to shun. Sometimes, in extreme cases, the thought of suicide possesses his mind. In these cases in which the deformity is not imaginary a corrective operation appeases a troubled mind and saves a useful member for society. It instantaneously restores confidence and hope for bigger things which make life worth-while. There are innumerable such instances which have been changed, as if by magic, from an inferiority complex to a complex on a plane with his fellow men. The surgeon must be on his guard when confronted with such cases. He must recognize that the need for rhinoplasty be a just and necessary one. He must not promise too much, for such an operation will not change the other features of the face except that they become more pronounced once the repugnant and objectionable nasal deformity is corrected.

Then there is the occupational conscious type factor. The patient has no inferiority complex but because he desires an amelioration of or advancement in his station of life he feels that his deformed nose is a detriment. In these acute days of difficult employment attractive features are sought along with ability and talent in many places. These patients will tell you that they cannot secure employment in their particular fields, because of their nasal handicap. Many of these are promised employment if they submit to the improvement of their appearances. Many young and even middle-aged promising actors and actresses comprise this group. Even the young business man who wishes to advance to an executive or more lucrative position in his firm seeks the plastic surgeon. There are those patients who desire a more esthetic nose but the

Fig 3 *Top left*—Front view, deviated nose to right and wide tip *Top right*—Nose straightened and tip narrowed *Bottom left*—Profile view, hump nose *Bottom right*—Hump removed

There are never any external incisions, hence no scars will be visible on the skin *

*In all patients whose photographs appear herein, the technic as devised by Joseph of Berlin was employed

Anesthesia

Local anesthesia is the method of choice. It consists of novocain two per cent and adrenalin 1 1000, twenty to thirty drops to an ounce of novocain. About twenty cc are used for the entire operation

The operation is not painful and there is comparatively no loss of blood. The eyelids and nose become swollen for a few days but then there is a gradual but steady return to normal. Usually a negligible systemic reaction is manifested in a rise of temperature within twenty-four

hours after the operation. The patient is permitted to get out of bed twenty-four hours after the operation provided the temperature is normal as is usually the case. Depending on the type of operation the patient may remain in the hospital from two to seven days.

Fig 2 *Top left*—Front view, wide tip *Top right*—Tip narrowed *Bottom left*—Profile view traumatic saddle nose. *Bottom right*—Saddle nose corrected by superposition of the lateral cartilages with addition of strips of alar cartilages

Technic of Operation

The needle is first inserted subcutaneously along the bony dorsum just below the glabella notch. The bony and cartilaginous dorsum is infiltrated. Then the needle is turned laterally to either side infiltrating the areas above the nasal bones and upper and lower lateral cartilages. The second injection is made between the posterior border of the columella and anterior margin of the septum. This is infiltrated in its entire length, from the tip of the nose to the

gauze impregnated with ten per cent cocaine. After five minutes the gauze is removed.

A nasal speculum is used to expose the nasal cavity. The inferior border of the upper lateral cartilage protrudes visibly into the nasal cavity. A fine double-edged Joseph's knife is inserted at this point. It is passed gently and slowly over the upper surface of the upper lateral cartilage and just beneath the skin. The knife does not go beyond the upper border of the upper lateral cartilage

Fig 5 *Left*—Long nose and bony and cartilaginous hump *Right*—Hump removed and nose shortened.

anterior nasal spine. Then the fibrous space between the upper border of the lateral crus of the alar cartilages and the lower border of the upper lateral cartilage is infiltrated. This is repeated on the opposite side.

After these injections, a few minutes are allowed to elapse in order to give the anesthetic ample time to take effect. When the patient experiences no pain at the prick of a needle, the actual operation may then begin.

If a nasal hump is present, its size is determined by a previous profile analysis and the operation is planned accordingly. Before proceeding to the removal of the hump, the nasal cavity is packed with

Then a periosteal elevator is inserted in the same opening and a subperiosteal nasal channel is created parallel to the nasal bridge and up to the nasofrontal suture line. The same is repeated on the opposite side. Then a right Joseph bayonet-shaped saw is inserted in the right subperiosteal channel and placed at right angles to the hump to be removed. By an up and down steady movement the hump is sawed off. It usually includes part of the nasal bones, septal cartilage, and part of the upper lateral cartilages. When the sawing is completed, the hump lies loosely attached in the nasal cavity by some fibrous tissue. This is cut by a fine straight knife. The blade is car-

Preparation

The patient is given morphine sulphate gr $\frac{1}{4}$ about one half hour before the operation. The vestibular vibrissae are clipped. The nose is sprayed with S T 37 solution. The entire face is then

washed with tr of green soap. Then a mask moistened with bichloride of mercury 1:3000 is applied to the face and the patient is brought to the operating room. After the patient is properly draped the face is disinfected with tr of Metaphen.
